Descriptors: *Cost-benefit analysis, *Dam failure, *Dam safety, *Dam stability, *Dams, *Design criteria, Emergency planning, Flood damage, Flood hazard, Probable maximum flood, Safety, Social costs.

The 1977 National Dam Inspection Program determined that many high-hazard dams in the United States were incapable of passing a probable maximum flood (PMF). Retrofitting these dams was estimated to cost at least $10 billion. Since the PMF is revised upward periodically, retrofit is a continual issue. But surviving a PMF is a more stringent safety criterion than preventing other sources of dam failure; in addition, it is more

stringent than safety criteria for other structures with respect to wind, earthquakes, or storm surges. This higher safety goal has large social costs. An alternative safety goal, separating property damage from possible loss of lives, is proposed. For a proposed dam whose failure could cause large loss of life or property damage, a careful evaluation should be done as to whether the dam should be built. For dams that impose smaller hazards, property damage should be handled by an analysis based on expected values of the annualized benefits and costs. An adjustment for scale could be used if the property damage were extremely large. Danger to lives should be handled by establishing programs to warn and evacuate people. This proposal should (1) lead to less injury and death, (2) use society's limited resources more efficiently, and (3) put the determination of safety goals on a more scientific and sensible basis. SLIPS AHOY.
Johnson, Johnson and Roy, Inc., Ann Arbor, MI.
F. A. Klancnik.
Civil Engineering (ASCE) CEWRA9, Vol. 60, No. 5, p 59-61, May 1990.

Descriptors: *Boating, *Docks, *Marinas, *Recreation facilities, Design criteria, Environmental impact, Harbors, Land development, Management planning.

Although the market for boat docking facilities will remain substantial in the 1990s, the construction of marinas is not expected to increase due to lack of developable sites, as seen in California, and increased capital expenditure requirements. The opening of the Tennessee-Tombigbee Waterway has increased marina demand in the central Gulf region. Several trends will help to alleviate demand pressures for new marinas. Research and engineering of the past decade have led to more effective floating dock systems and wave attenuators; where water levels fluctuate more than 2 or 3 ft, as in the Great Lakes marinas, floating systems will dominate the market. Sophisticated modeling techniques and government-sponsored research are generating better and more cost-effective methods of protecting harbors and shorelines. Larger boats are increasing the spatial requirements for docking facilities and landside development costs are increasing as boat owners come to look upon the marina as a center of leisure activity. Long-term leasing of dock space is helping developers to recover the initial capital expenditures for building new dock sites. Public awareness of the environmental impact of marina construction is lengthening the planning and design time required before permits are secured and construction can begin. (Geiger-PTT)

MICROTUNNELING TECHNIQUES AID SEWER INSTALLATION.
Houston Dept. of Public Works, TX.
P. D. Barnhard, and J. E. Pate.
Public Works PUWOAH, Vol. 121, No. 8, p 69-70, 1990. 3 fig.

Descriptors: *Houston, *Microtunneling, *Sewer systems, *Texas, *Wastewater collection, Economic aspects, Gravity relief sewers, Noise, Pipelines, Public relations, Sanitary engineering.

As the River Oaks area of Houston developed, problems with the wastewater collection system multiplied and the system became heavily overloaded, which resulted in frequent system overflows. By the 1980's, the area required numerous wastewater system improvements. Because the same problem existed throughout Houston, the department of public works developed a comprehensive plan of wastewater improvements. To minimize disruption to the area during construction, the public works department selected the microtunneling technique for installing gravity sewer lines, rather than conventional open cut construction. The River Oaks project required the construction of 20000 feet of 8 inch through 21 inch gravity relief sewers, various appurtenances, two lift stations, and related force mains. Microtunneling is a method of installing pipes as small as ten inches in diameter by pipe jacking techniques. The machines operate from a jacking pit and the pipe is jacked in precise alignment toward a target. The microtunneling machine excavates material from its path as it is jacked forward from the starting pit. As the pipe is jacked forward, the soil ahead of it is removed and transported by slurry line or auger through a smaller pipe inside the one being jacked in place. Groundwater levels varied from 8 to 30 feet below the ground surface. The River Oaks sanitary sewer line varied in depth from 8 to 25 ft both above and below the water table depending on circumstances. Prices for microtunneling vary depending upon a variety of factors or cost determinants, including depth, pipe size, soil conditions, accessibility of the area, pit location, pipe type, and length of push involved. Microtunneling does have certain disadvantages, however, that should be considered when evaluating this construction alternative. Construction time from set-up to completion is lengthened; shafts for lateral sewer lines as well as the primary relief line are open longer than is required for conventional construction; and, microtunneling is a costly construction alternative. The microtunneling techniques does, however, significantly minimize business and neighborhood disruption, and avoids much of the noise associated with typical utility construction project. LOCAL SCOUR PROFILES DOWNSTREAM OF HYDRAULIC JUMP.
Ministry of Energy, Tehran (Iran).
J. Farhoudi, and K. V. Smith.
Journal of Hydraulic Research JHYRAF, Vol. 23, No. 4, p 343-358, 1985. 12 fig, 1 tab, 9 ref.

Descriptors: *Channel morphology, *Channel scour, *Flow characteristics, *Hydraulic geometry, *Hydraulic jump, *Hydraulic models, *Sediment transport, Bed load, Mathematical studies, Model studies, Suspended sediments.

The development over time of local scour holes downstream of a hydraulic-jump-type flow shows certain geometrical similarities. These similarities exist both in the process of scour and in the profiles that the scour holes follow downstream of hydraulic-jump flow. An investigation was carried out using three geometrically-similar models with the geometrical scale progressing by a factor of two. The sediment movement was governed by material moved in suspension for the initial period of scour. The suspension process was intensified by decreasing the weight of the sediment, increasing the flow, or lowering the tailwater. The suspension movement changed to bed-load movement with the passage of time. This type of scour differs from scour under vertical and plunging jets in which the suspension process predominates. But it is in agreement with scour reported from below horizontal jets. Among the characteristic geometric parameters of the scour hole a relationship exists which, for similar conditions, makes it possible to select only one of these parameters to describe all the scour hole geometry. The derived coefficients are independent of sediment properties although influenced by geometry and intensity of flow. The definition of the scour profile makes it possible to predict the volume of sediment removed from the scour hole at any time provided the corresponding maximum depth of scour is known. HYDRAULIC JUMPS AT POSITIVE AND NEGATIVE STEPS.
Ecole Polytechnique Federale de Lausanne (Switzerland). Chaire de Constructions Hydraulics.
W. H. Hager, and N. V. Bretz.
Journal of Hydraulic Research JHYRAF, Vol. 24, No. 4, p 237-253, 1986. 14 fig, 15 ref, append.

Descriptors: *Channel morphology, *Flow characteristics, *Hydraulic geometry, *Hydraulic jump, *Stilling basins, Critical flow, Froude number, Hydraulic design, Standing waves, Tailwater.

The hydraulic flow features associated with a hydraulic jump over positive and negative steps were investigated. To facilitate the design of stilling basins, emphasis was placed on extreme values of the variables. In particular, the sequent depths ratio, the length characteristics, and the wave formation were analyzed by elementary means and confirmed by observations. The relations for the sequent depths ratios were in agreement with the data analyzed. The shape of the step was insignificant provided the transition from super to subcritical flow conditions prevailed at the step. The sequent depth ratio depended only on the relative step height, and the approaching Froude number, F1. The relative length of the standing wave was also a function of F1. Negative steps had approximately six times more variation in tailwater depth. For higher F1 values, the dissipation of all hydraulic jumps was approximately equal and corresponded to that of a hydraulic jump in a horizontal channel. The hydraulic jump at a positive step was more compact than that at a negative step. (Stoehr-PTT)

B. R. Samaga, K. G. Ranga Raju, and R. J. Garde.
Journal of Hydraulic Research JHYRAF, Vol. 24, No. 4, p 297-308, 1986. 9 fig, 1 tab, 9 ref.

Descriptors: *Alluvial channels, *Channel flow, *Sediment transport, *Sediment-water interfaces, *Streambeds, *Velocity distribution, Mathematical models, Momentum transfer, Rhine River, Rio Grande, Suspended sediments.

The velocity distribution equations which have been developed recently using data on sediment-laden flow over a rigid plane bed were checked with experimental data for flow over alluvial beds of sediment mixtures and found to be unsatisfactory for this case. Making use of data from various sources, a two-layer model of velocity distribution over alluvial beds was developed. In this model it was assumed that, in the region where distance from the bed is less than 0.2 times the depth of flow, the momentum-transfer coefficient is a constant. This assumption was made in the light of the fact that, due to high sediment concentration and intense turbulence, the flow in this region is complicated, and the value of the momentum-transfer coefficient is different from its value for the region where distance from the bed is greater than one fifth of the depth of flow. The model agrees with field measurements of the Rhine and the Middle Rio Grande. (Stoehr-PTT)

IMPROVED METHOD OF CALCULATION FOR STEADY UNIFORM FLOW IN PRISMATIC MAIN CHANNEL/FLOOD PLAIN SECTIONS.
Queen Mary Coll., London (England). Dept. of Civil Engineering.

P. R. Wormleaton, and D. J. Merrett.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 2, p 157-174, 1990. 9 fig, 1 tab, 29 ref.

Descriptors: *Channel flow, *Flood plains, *Hydraulics, *Open-channel flow, *Steady flow, *Uniform flow, Discharge measurement, Hydraulic models, Mathematical studies, Regression analysis, Shear stress.

Experimental results are presented from the Science and Engineering Research Council Flood Channel Facility at Hydraulics Research, Wallingford, for discharge and boundary shear stress distribution in symmetrical compound channel/flood plain sections of varying flood plain width and roughness. These are used to assess the performance of several standard discharge calculation methods, which assume different locations of the interface between main channel and flood plain subareas. It is shown that these methods can produce large errors in total and component discharges, which increase significantly with flood plain width and roughness. A modified form of the above methods is discussed, which makes a more realistic allowance for interaction at the main channel/flood plain interface. It achieves this by incorporating the Radojkovic indices to characterize momentum transfer between adjacent subareas into the calculation. This modified method is shown to be considerably more accurate than the standard methods in calculating total and component discharges. A tentative regression equation is presented for calculating Radojkovic indices from easily identifiable cross section characteristics. (Author's abstract)

TURBULENCE MEASUREMENTS IN A SHEAR LAYER REGION OF A COMPOUND CHANNEL.
Birmingham Univ. (England). Dept. of Civil Engineering.
D. W. Knight, and K. Shiono.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 2, p 175-196, 1990. 17 fig, 30 ref.

Descriptors: *Hydraulic models, *Open-channel flow, *Shear stress, *Turbulence, *Turbulent flow, Boundary processes, Eddies, Flood plains, Flow measurement, Momentum transfer, Upwelling.

The Science and Engineering Research Council Flood-Channel Facility at Hydraulics Research Ltd., Wallingford, England, represents a large-scale model of a river system with floodplains, and is designed to produce fully-developed boundary-layer flows with transverse shear. Some of the preliminary open-channel flow data, including turbulence measurements, performed in the facility are presented. The vertical distributions of primary velocity are essentially logarithmic in regions of a compound channel where the lateral shear stresses are low. Where the logarithmic law applies, the vertical distributions of turbulent intensity and kinetic energy follow standard forms and the appropriate empirical coefficients have been determined. The spatial distributions of primary velocity, turbulent intensity, kinetic energy, and Reynolds stresses are given for two overbank flows. In regions where there is high lateral shear superimposed on bed-generated turbulence, the vertical distributions of Reynolds stress are highly nonlinear. Longitudinal vortices, generating secondary flows along the river-channel/flood-plain interface were found to be important for depths as low as 0.25 relative to depth of flow in the main channel. The upwelling at the river-channel/flood-plain interface causes considerable variations in horizontal mean velocities and Reynolds stresses, which in turn produce large plan-form eddies that transfer momentum from the river channel to the flood plain. The lateral variations in local friction factor for different relative depths suggest that, unlike the depth-averaged eddy viscosity, constant values may be ascribed to particular subareas of a compound channel. SERC FLOOD CHANNEL FACILITY: SKEWED FLOW EXPERIMENTS.
Bristol Univ. (England). Dept. of Civil Engineering.
S. C. Elliott, and R. H. Sellin.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 2, p 197-214, 1990.

Descriptors: *Hydraulic models, *Hydraulics, *Open-channel flow, *Velocity distribution, Boundary processes, Flood plains, Flow measurement, Momentum equation, Shear stress, Water circulation.

Experiments carried out on a skewed compound channel in the Science and Engineering Research Council (SERC) Flood-Channel Facility operated at Hydraulics Research Ltd., Wallingford, England, are described. The project is one of a coordinated group of four being run simultaneously by U.K. University research groups involving the hydraulics of overbank river flow. The interactive cross flows that occur between floodplain and main channel when the two are not parallel were examined. The project was designed to prepare the way for a later examination of overbank flow in meandering channels. Results show that the velocity distribution both in the main channel and over the two floodplains are distorted by the cross flow, as is the boundary shear stress distribution. The momentum equation was used to analyze the forces acting on the flow both for the whole cross section and also for the sub-units comprising the floodplains alone. The apparent shear force at the floodplain longitudinal interface was isolated from the momentum transport effects of the cross flow and compared with the comparable term in the prismatic compound channel case. From an analysis of velocity and flow-angle distribution in the main channel it was possible to construct a system of secondary circulation cells in the main channel. For the example given this was found to be complex and asymmetric, as might be expected from the imposed flow conditions. (Stoehr-PTT)

CLASSIFICATION OF UNIDIRECTIONAL THREE-LAYER FLOW OVER A HUMP.
Contra Costa Water District, Concord, CA.
R. A. Denton.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 2, p 215-233, 1990. 6 fig, 3 tab, 18 ref.

Descriptors: *Channel morphology, *Flow characteristics, *Flow models, *Hydraulics, *Stratified flow, Flow measurement, Flow rates, Froude number, Internal waves, Model studies.

The effect of increasing the constriction of steady multilayer flow over a hump and through a sidewall contraction was investigated. Classification diagrams of hump height versus a representative flowrate Froude number are useful for showing the range of flow conditions over which different flow regimes exist and their relationship with each other. Solutions of the three-layer model at a first-mode control suggest that the velocity profile for multilayer flow should always have an approximately two-layer shape where the flow is critical with respect to the first-mode internal wave. These laboratory experiments for three-layer flow and earlier two-layer experiments confirm that inviscid gradually-varying flow models are able to successfully predict the location of hydraulic controls and the interface profiles for most flow regimes. However, further work is needed to fully explain the difference between theory and experiment when the main control at the hump is an approach control. (Stoehr-PTT)

THREE-DIMENSIONAL ANALYSIS OF PRESSURES ON DAMS.
Sinotech Engineering Consultant, Inc., Taipei (Taiwan).
M. H. Wang, and T. K. Hung.
Journal of Engineering Mechanics (ASCE) JENMDT, Vol. 116, No. 6, p 1290-1304, June 1990. 9 fig, 2 tab, 18 ref. NSF Grant ECE-8414649.

Descriptors: *Dams, *Earthquakes, *Finite difference methods, *Hydrodynamics, *Mathematical models, *Model studies, Hydraulic structures, Reservoirs, Seismic properties.

The calculation of hydrodynamic pressures in a dam/reservoir system has been advanced from an added mass approach to a more complex dam/water interaction. A span-wise variation of nonlinear hydrodynamic pressures on dams during earthquakes was studied using a finite-difference approximation of Euler's equations, coupled with the nonlinear free-surface boundary condition. The pressure distribution was sensitive to both the longitudinal and lateral components of the ground motion. The dynamic effect of reservoir banks would increase with the dam width. The inward motion of a reservoir bank produced higher pressures on one side, while the outward motion of the other bank resulted in a reduction in hydrodynamic pressures. These effects will be smaller when the slope of the bank deviates from the vertical. The combined effect can be effectively obtained when the geometric parameters of a dam/reservoir system, the changes in water surface, and the earthquake force are cast in the equations of motion. In this case, the time-dependent water surface is transformed to the horizontal plane, and the flow field is mapped onto a cubic region, making it convenient to model the complex reservoir geometry and the wavy water surface by the finite-difference method. (Author's abstract)

NONLINEAR HYDRODYNAMIC PRESSURE ON DAMS.
Pittsburgh Univ., PA. Dept. of Civil Engineering.
T. K. Hung, and B. F. Chen.
Journal of Engineering Mechanics (ASCE) JENMDT, Vol. 116, No. 6, p 1372-1391, June 1990. 17 fig, 1 tab, 25 ref. NSF Grant ECE-8414649, Pittsburgh Supercomputing Center Grant PSCA20.

Descriptors: *Dams, *Earthquakes, *Finite difference methods, *Finite element method, *Hydrodynamics, *Mathematical models, California, Concrete dams, Gravity dams, Hydraulic structures, Pine Flat Dam, Reservoirs, Seismic properties, Waves.

The dynamic interaction between nonlinear hydrodynamic pressures and the vibration of a concrete gravity dam was analyzed by coupling Euler's equations with a finite element model of the dam. The Euler equations for compressible flow were solved with the nonlinear free-surface boundary condition, and with a finite element analysis of the dynamic behavior of the concrete gravity dam. The earthquake force components in the horizontal and vertical directions were cast as the forcing functions in the finite difference equations for fluid motion. The results were compared with those associated with a rigid dam motion. The pressure distributions are very sensitive to dam vibration and surface waves. For El Centro ground motion recorded on October 15, 1979, the calculated rise of the water surface on Pine Flat Dam on King River near Fresno, CA was 8 ft (2.7 m), indicating a strong nonlinear effect on hydrodynamic pressures and the potential hazards of surface waves in the reservoir. The hydrodynamic effect was highly augmented by the vibration of the dam. (Author's abstract)

AIR ENTRAINMENT BY SPILLWAY AERATORS.
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
P. Rutschmann, and W. H. Hager.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 6, p 765-782, June 1990. 13 fig, 1 tab, 20 fig.

Descriptors: *Aerators, *Air entrainment, *Cavitation, *Model studies, *Spillways, Hydraulic models, Hydrodynamics, Mathematical models.

Aerators on spillways may be regarded as an effective protection against cavitational erosion. The air entrainment of aerators is governed by a number of independent parameters that include the slopes of the spillway and the aerator, the heights of ramp and offset, the approaching flow depth and Froude number, and the stagnation pressure in the nappe cavity. Based upon model observations, two approaches were used to determine the air entrainment coefficient. The direct approach is based upon the analysis of each effect on the coefficient. An expression is presented that should be tested for other geometries. The indirect approach is based on the length of jet for zero cavity subpressure. The resulting expression for the maximum air entrainment coefficient may then be corrected for the effect of cavity subpressure. The present approach introduces developing and developed aerator flow conditions. Further, the cavity subpressure is accounted for by a different Euler number. The final system of equations for the coefficient was compared to model and prototype data, and a fair agreement was noted. (Author's abstract)

BED FORM RESISTANCES IN OPEN CHANNEL FLOWS.
California Univ., Berkeley. Dept. of Civil Engineering.
H. W. Shen, H. E. Fehlman, and C. Mendoza.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 6, p 799-815, June 1990. 8 fig, 2 tab, 21 ref. NSF Grant No. ENG-7825054.

Descriptors: *Bed load, *Channel morphology, *Flow around objects, *Flow resistance, *Open-channel flow, *Sediment transport, *Sedimentation, *Streambeds, Darcy-Weisbach equation, Flow friction, Mathematical models, Model studies, Streamflow, Turbulent flow.

The different bed forms that develop at the interface between flow and the river bed are characterized by form resistance that can cause significant rises in flood levels. Many previous studies suggest the division of total resistance into skin resistance and form resistance without direct evidence. The skin resistance, form resistance, and total resistance were independently measured for a series of rigid bed forms in the laboratory. The data show that the sums of skin resistance and form resistance are close to the total resistance for all experimental runs conducted. Furthermore, data collected in this and other studies indicate that form resistance can be predicted from known bed form shapes. The Darcy-Weisbach form factor and the pressure drag coefficients are related only to the relative height of the dunes and independent of the flow velocities. The variation of form resistance for alluvial bed forms are similar to the expansion losses in pipelines. Skin resistance on the bed form has no significant effect on form resistance of the same bed form. The measured local skin stress increases almost linearly from a zero value at the flow reattachment point to a maximum value at the dune crest. A relationship was derived to predict the skin resistance as a function of flow Reynolds number, relative roughness, and relative height of dunes based on data collected in this and other studies. COMPREHENSIVE GENERALIZED STUDY OF SCOUR AT CANTILEVERED PIPE OUTLETS.
Agricultural Research Service, Stillwater, OK. Water Conservation Structures Lab.
F. W. Blaisdell, and C. L. Anderson.
Journal of Hydraulic Research JHYRAF, Vol. 26, No. 4, p 357-376, 1988. 9 fig, 34 ref.

Descriptors: *Conveyance structures, *Erosion, *Hydraulic models, *Mathematical models, *Model studies, *Pipes, *Scour, *Spillways, Sediment transport.

Pipe spillways with cantilevered outlets have been used by the Soil Conservation Service on many of the principal spillways for several million relatively small farm ponds and several ten thousand relatively large upstream floodwater protection and water conservation structures. A literature review revealed information on the general principles of local scour at pipe exits, but inadequate practical information on scour and prevention of scour at pipe outlets. A study addressed the design of riprapped cantilevered pipe spillway plunge pool energy dissipators having the shape of self-formed scour pools. The design of the experiment was based upon the assumption that the cantilevered pipe will be a satisfactory spillway outlet structure for a range of discharges and bed material sizes, but that excessive scour will occur if the flow rate exceeds some limit. The study variables and their range were selected to cover the range of anticipated practical use. Discharge rate, pipe slope, water temperature, and a variety of bedload materials were used in the experiments. The flow was interrupted periodically during the test runs and the scour hole measured to record the time development of the scour. It was determined that the scour hole shape varies with the discharge, length of time of scour, and whether or not material is suspended in the scour hole. 'Beaching' occurs when the strength of the reverse currents along the sides of the scour hole are sufficient to erode the bank material. Equations for the jet trajectory were developed to determine the theoretical path from the pipe exit to the point at which the jet attacks the bed. (Tappert-PTT)

PREDICTION OF FLOW CHARACTERISTICS IN MAIN CHANNEL/FLOOD PLAIN FLOWS.
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
R. J. Keller, and W. Rodi.
Journal of Hydraulic Research JHYRAF, Vol. 26, No. 4, p 425-441, 1988. 7 fig, 2 tab, 26 ref.

Descriptors: *Channel flow, *Channels, *Flood channels, *Flumes, *Mathematical models, *Model studies, *Streamflow, Finite volume method, Flow models.

Flow in channels of compound cross-section, comprising a deep main channel and adjacent shallow flood plains, is a complex, three-dimensional phenomenon. The development of a depth-averaged two-dimensional mathematical model to calculate flow characteristics in channels of compound cross-section simplifies the calculations for instances where the resolution of vertical distributions is not of interest. The model utilizes a previously developed depth-averaged form of the kappa-epsilon turbulence model. The solution procedure is a finite volume method and is particularly economical with regard to both computing time and storage requirements. The model was tested against velocity and bed shear stress data taken from the literature and obtained in laboratory flumes modelling a main channel/flood plain geometry. Comparisons between these data and model predictions show generally good agreement. One necessary input to the model is the dimensionless transverse eddy diffusivity, e, which has a significant influence on the predicted distributions. A value of 0.15, adopted from the literature for rectangular laboratory flumes, was shown to be appropriate for laboratory compound channels. However, application of the model to natural compound channels requires further investigation of this parameter. (Tappert-PTT)

BRIDGES AND CULVERTS REDUCED IN SIZE AND COST BY USE OF CRITICAL FLOW TRANSITIONS.
Shire of Stawell (Australia).
N. H. Cottman, and G. R. McKay.
Proceedings of the Institution of Civil Engineers PCIEAT, Vol. 88, No. Pt 1, p 421-437, June 1990. 12 fig, 1 tab, 6 ref.

Descriptors: *Bridge design, *Bridges, *Culverts, *Hydraulic engineering, Channel design, Construction costs, Flood plain management, Streamflow.

A means for reducing the size and cost of bridges and culverts was explored to increase throat velocity by streamlining the whole of the upstream approach and downstream exit flows at structures, rather than increasing the head. This innovative concept for designing channel transitions converged wide, shallow, subcritical flows into high-velocity critical flows. The flows were then passed through deep, narrow throats that were cheaply culverted or bridged. The outflow was finally diverged, spread and decelerated before being passed downstream with minimum head losses. These minimum energy or maximum discharge designs were first used in Australia in 1961. They offered a means of passing large flows through much smaller, more efficient and more economical culverts and bridges, without the considerable upstream afflux that is the bane of conventional hydraulic structures. The design procedures accurately predicted performances in the field. The usual problems of erosion, siltation, debris and energy dissipation were shown to be either absent or manageable. The concept was very useful for increasing the capacity of many suitable flood plain bridges at minimal cost. (Mertz-PTT)

VARIATIONAL PRINCIPLE METHOD WITH VARIABLE DOMAIN IN THE FLOW PROBLEM WITH FREE SURFACE.
Shanghai Inst. of Mechanical Engineering (China).
C. Yue-Lin, and Y. Xiao-Fing.
Advances in Water Resources AWREDI, Vol. 13, No. 1, p 50-52, March 1990. 5 fig, 5 ref.

Descriptors: *Finite element method, *Fluid mechanics, *Free surfaces, *Mathematical models, Data interpretation, Gravity dams, Gravity flow, Hydraulic models, Mathematical analysis.

The finite element method has been used to solve hydraulic problems since the early 1970s. An important factor of the method is how to deal with the free surface problem when the exact position of the free surface is not known beforehand. A variational principle with variable domain is used in the solution. The method introduces a functional on the variable domain, then obtains a solution equal to that of differential equations by directly solving the extreme value of the functional. When

conventional finite element analysis is undertaken, the domain (D) is divided in two domains, D1 and D2, where D1 is a presumed fixed domain and D2 is a variable domain. The method can be used to calculate dam outflow. (Tappert-PTT)

In open channel flow, when a hydraulic jump is forced, an hysteretic behavior is observed in a particular range of values of the governing variables. The catastrophe theory was applied to the study of this phenomenon. The geometry of the cusp catastrophe was used as a descriptive model with which it was possible to gather certain behavior peculiarities in the phenomenon, such as hysteresis, sudden jumps, bimodality, and divergence. In addition, a nomenclature in accordance with the usual one in catastrophe theory has been proposed. The cusp catastrophe geometry has been used mainly as a descriptive model, the quantitative solution procedure consists essentially in applying well-known equations such as the specific energy equation, with the aid of the qualitative model, and considering the control parameter variation. The results were experimentally verified for a simplified study case, thus work showing how the elementary catastrophe theory can be used as a useful descriptive modeling tool in hydraulics. Journal of Hydraulic Research JHYRAF, Vol. 25, No. 3, p 313-327, 1987. 11 fig, 13 ref.

Descriptors: *Channel flow, *Dam failure, *Hydraulic models, *Hydraulics, Dams, Mathematical analysis, Mathematical equations, Mathematical models, Model studies, St Venant equation.

A solution has been calculated and plotted dimensionlessly for a dam-break flood on a sloping channel that is initially dry. The solution neglects channel bed resistance and assumes that the entire dam is removed instantaneously. In obtaining this solution, it has been shown that a solution for a dry channel does not exist when the usual approximations are made for a non-zero bed-resistance term in the St. Venant equations. Comparisons of the inviscid solution with experimental measurements for two different channel roughnesses showed that increasing the channel roughness caused large increases in both flow depths and wetting-front arrival times. Since increasing the scale of an experiment often causes a decrease in relative roughness and an increase in Reynolds numbers, it is concluded that prototype measurements relatively close to the burst dam may well be approximated more closely with the inviscid solution calculated herein than with experimental measurements obtained from a small-scale model. Descriptors: *Hydraulic systems, *Network analysis, *Pipe flow, *Pipes, Approximation method, Computer models, Element method, Mathematical analysis.

As a result of the recent boom in microcomputer hardware, the element method for pipe network analysis has become feasible for determining flow and pressure in hydraulic networks. The proposed modified method addresses the convergence behavior by using a Newton-Raphson procedure on the residue of a partionned matrix system. Reordering of the elements gives a sub-matrix topology of particular types that can be inverted with efficient algorithms. It results in a matrix, the order of which corresponds to the number of loops in the system, to be inverted during the iterative process. Two examples, taken from previous papers, illustrate the advantages of the method: a gain in convergence compared to classical methods, a resolution strategy optimized by the improvement of the matrix topology and its partitioning into a linear and non-linear submatrix, and good convergence behavior for bad cases and use of the self-adjusting friction factor. Discharge characteristics of a local, discontinuous contraction in a rectangular channel for submerged flow conditions were studied using a theoretical approach analyzing the separation zone as well as the local head-loss along the contraction by accounting for the contraction ratio, the inlet angle and the relative contraction length. General solutions are obtained by a matching procedure, and design relations are established. It was found that the separation of the flow from the leading edges of the contraction geometry and the local head-loss for zones of diverging streamlines must be accounted for. Based on a quasi two-dimensional approach, these two quantities are theoretically investigated for two limit cases. The general solution for arbitrary contraction geometry and subcritical flow characteristics is found by a matching procedure. The final result allows direct application to arbitrary cases. The possible flow pattern in connection with local contractions can be classified into a transitional, a purely subcritical and a locally supercritical flow state with surface undulations. Experiments were performed in order to verify the theoretical approach, and a good agreement was found. The deviations with respect to the upstream flow depth were always below 30%. (Agostine-PTT)

ENERGY HEAD IMPLICATIONS OF THE INSTALLATION OF CIRCULAR FLAP GATES ON DRAINAGE OUTFALLS.
Liverpool Univ. (England). Dept. of Civil Engineering.
R. Burrows, and J. Emmonds.
Journal of Hydraulic Research JHYRAF, Vol. 26, No. 2, p 131-142, 1988. 6 fig, 12 ref.

Descriptors: *Flap gates, *Gates, *Head loss, *Hydraulic gates, *Hydraulic machinery, *Hydraulic structures, *Sewer systems, Flooding, Hydraulics, Hydrodynamics, Outfall sewers, Urban areas.

Flap gates are widely used for the protection of drainage systems against flood influx from high receiving stream levels or from tidal levels in coastal locations. Inclusion of a gate will increase the consequential upstream surcharge or flooding, especially for closed conduit systems such as urban sewers where little detention storage capacity is available for temporary retention of the storm

influx. Experimental apparatus was constructed to establish what additional upstream head results from the use of flap gates. The effect of gate weight, gate angle, flow rate, and other construction parameters was investigated. Energy losses resulting from the flow constriction are found to be largely dependent on the flowrate and the gate's weight when subjected to a tailwater surcharge. Guidance on gate selection and head loss implications in the literature is sparse and design curves are presented to partially fill this gap. These curves show that the total energy loss at the outfall resulting from the use of heavy gates can be more than double the kinetic energy head of the pipe flow, representing the normal pipe exit losses. Protection of the outfall by means of a wing-wall surround with raised sill may further increase the head requirement. (Tappert-PTT)

The seismic analysis and design of an arch dam has not been studied in as much detail as that of a concrete gravity dam because of the complex nature of the problem. The boundary element method has been successfully applied in the past to the analysis of hydrodynamic forces in two-dimensional infinite as well as two-dimensional and three-dimensional finite reservoirs subjected to seismic ground motion. More recent research on the application of the constant boundary element method (BEM) to the 3D analysis of reservoir vibration demonstrate the effectiveness of the procedure for evaluating hydrodynamic pressures in a 3D water reservoir of arbitrary shape. The energy loss in the waves traveling to infinity is represented by a special boundary condition to be applied to the truncated far end of the reservoir. Special boundary conditions, previously used in the 2D case to treat infinite radiation damping and damping from foundation soil and banks, have been incorporated in this formulation. Numerical results for vibration of a 3D infinite rectangular reservoir as well as of a 3D infinite reservoir impounded by an arch dam are presented and compared with some existing results obtained by other researcher. Most of the results show qualitative similarities, although significant differences exist presumably due to the difference in the geometry of the infinite part. One drawback of the BEM is the frequency dependence of the fundamental solution which requires the computation of the elements of boundary element matrices for each excitation frequency. Journal of Engineering Mechanics (ASCE) JENMDT, Vol. 116, No. 7, p 1451-1472, July 1990. 24 fig, 1 tab, 10 ref, append.

Descriptors: *Earthquake engineering, *Hydrodynamics, *Isolation, *Structural behavior, *Water tanks, Buildings, Kinematic wave theory, Structural engineering, Waves.

Extensive work has been done on the response of internal equipment in structures subjected to ground motion. An important advantage of base isolation is the protection of internal equipment, including fluid containers, in buildings against high accelerations transmitted from the ground and amplified in the structure. The dynamic pressure exerted by the fluid on the walls of its container greatly depends on the support acceleration. Base isolation reduces drastically the amplification of these accelerations. The low frequency that characterizes the motion of base isolated structures can affect the water elevation response. The response of a cylindrical water tank fixed to the shake table was compared to that of a similar one installed in the bottom of a base-isolated nine-story steel structure. The structure was isolated on eight multilayered elastomeric bearings. Due to the reduction in ground accelerations, the dynamic pressure is reduced for the tank in the isolated structure. Free-surface water elevation was slightly increased due to the lower frequency that characterizes the motion of base-isolated structures. This problem can by overcome by appropriate selection of the isolation system or by the addition of dampers at the location of maximum water particle velocities. The response of fixed base structures is amplified along their height, while for base-isolated structures, the base and higher stories have practically the same response. For this reason, when fluid containers are located in the upper stories of a building, base isolation is very favorable. A theoretical solution developed from linear wave theory correlates very well with the experimental results. (Fish-PTT)

The research of Jovan Cvijic in the field of karst phenomena is discussed. Cvijic published his observations on geologic, geomorphologic and hydrographic conditions of individual karst terrains and karst in general, in a number of books in the early 20th century. His contribution to the understanding of the Central Dinaric Karst, and in particular its main phenomena, the karst poljes, is in his interpretation of poljes' origin, evolution and hydrographic features. According to Cvijic, the poljes are erosion forms but their tectonic predisposition is often highly expressed. The target points of the erosion are often connected to marginal and other faults. Cvijic's postulatiens concern three hydrographic zones in karst: the dry zone, the transition zone, and the zone with permanent water flows. The need for proper understanding of field geology for the detection and capture of waters of karst aquifers is stressed. (See also W91-00318) (MacKeen-PTT)

ANALYSIS OF SCALE EFFECTS ON PERFORMANCE CHARACTERISTICS OF HYDRAULIC TURBINES: PART 2: EFFECTS OF SURFACE ROUGHNESS, RUNNER SEAL CLEARANCE AND REYNOLDS NUMBER ON PERFORMANCE AND LOSS DISTRIBUTION COEFFICIENTS.
Kanagawa Univ. (Japan). Dept. of Mechanical Engineering.
T. Ida.
Journal of Hydraulic Research JHYRAF, Vol. 28, No. 1, p 93-104, 1990. 9 fig, 10 ref.

Descriptors: *Hydraulic turbines, *Hydraulics, *Reynolds number, *Roughness coefficient, *Turbines, Flow rates, Loss distribution coefficient, Surface roughness, Surface velocity, Water temperature.

The effect of surface roughness of flow passages, runner seal clearance and the Reynolds number on the hydraulic performance and loss distribution coefficient was examined. V-(opt), which is the value of the loss distribution coefficient at the optimum efficiency point, varies within the range of approximately 0.96-1.05 times the original value when the surface roughness of all of flow passages in a model turbine becomes 0.5-2 times the original roughness. However, the loss distribution coefficient at the optimum efficiency point does not vary with the runner seal clearance. When the Reynolds number varies with the change of head or water temperature, the admissible surface roughness of each flow passage decreases as the Reynolds number increases, thus each friction coefficient becomes the value corresponding to the rough surface region. As a result, the change of performance and the loss distribution coefficient at the optimum efficiency point due to the change of the Reynolds number becomes smaller in comparison to that in the case with smooth surfaces. On the contrary, when the head, water temperature and surface roughness are unchanged and the Reynolds number varies only with the size of turbine, the relative roughness decreases as the Reynolds number increases and becomes the value in the smooth surface region. As a result, the change of performance and loss distribution coefficient at the optimum efficiency point is larger than the former case mentioned above. In other words, the effect of roughness cannot be neglected for examining the effect of the Reynolds number on the optimum efficiency loss distribution coefficient. (Author's abstract)

*Water conveyance, Leakage, Soil properties, Strain, Water mains.

Segmented buried pipelines are commonly used in water supply, sewage, and gas systems. These pipelines are frequently damaged during earthquakes as a result of permanent ground deformation or seismic wave propagation. This damage most often occurs at the joints. An analytical model for evaluating the response of long straight runs of segmented buried pipelines to seismic wave propagation is presented that takes into account the non-linearity as well as the variability of the system characteristics. Model results indicate that the variability of joint displacement is strongly influenced by a variability in joint stiffness characteristics, but not significantly influenced by variations in soil properties. The probability of leakage is a function of the normalized joint displacement. Results from laboratory tests by others are used to establish the relative joint displacement which leads to leakage. These elements are combined to predict the damage ratio (number of leaks per kilometer) for cast iron pipes with lead caulked joints subject to a joint pull-out failure mode. The joint pull-out damage ratio is a decreasing function of pipe diameter, and for any diameter it is a non-linear function of ground strain. (Tappert-PTT)

STRIDES IN NONDESTRUCTIVE TESTING.
Olson Wright NDT and E, Inc., Lakewood, CO.
L. D. Olson, C. Wright, and K. H. Stokoe.
Civil Engineering (ASCE) CEWRA9, Vol. 60, No. 5, p 52-55, May 1990. 4 fig.

Descriptors: *Materials testing, *Nondestructive tests, *Seismology, *Spectral analysis, Civil engineering, Dam inspection, Foundations, Materials engineering, Seismic waves, Shear stress, Stability analysis, Stress analysis, Youngs modulus.

Stress wave methods of materials testing are finding increasing applications in the civil engineering field. Mechanically generated stress waves involve one of four measurements approaches (1) frequency or spectral analysis of surface wave propagation; (2) direct measurement of stress wave velocities; (3) measurement of stress wave echoes; and (4) resonant, or modal vibration measurements. A new seismic method, spectral analysis of surface waves (SASW) determines shear modulus profiles at soil sites and Young's modulus profiles at pavement sites. SASW was used to determine the global density of a massive landslide in the Valtellina valley of northern Italy in 1987. The SASW measurements were effective to depths of more than 150 ft without drilling borings. Two primary low-strain stress wave techniques for evaluating the integrity and length of deep foundations from the foundation head are seismic echo (SE) and impulse response (IR). The two surface methods were used on a drilled shaft foundation for a microwave communication tower for which the New Jersey Transit Authority specified quality assurance with respect to deep foundation integrity. The two methods gave comparable results and the IR test also measured the low-strain dynamic stiffness (force-deflection) at the foundation head. The IR method was adapted for subgrade support evaluation of concrete slabs and pavements and can be used to evaluate spillways, conduits, tunnels, and grouting. The adapted IR method detected loss of subgrade support in the foundation of a warehouse damaged by water. Two main stress wave techniques are used to evaluate structural integrity: ultrasonic pulse velocity (a direct measurement technique) and impact echo (IE). IE is a sonic echo test for detecting flaws and measuring thicknesses of structural concrete members. IE methods detected cracks in Humphrey's Dam, an arch dam in southwest Colorado. (Geiger-PTT)

CASE HISTORIES OF SULFIDE CORROSION: PROBLEMS AND TREATMENTS.
Brown and Caldwell, Sacramento, CA.
R. A. Witzgall, I. S. Horner, and P. L. Schafer.
Water Environment & Technology WAETEJ, Vol. 2, No. 7, p 42-47, July 1990. 2 tab, 3 ref.

Descriptors: *Corrosion, *Sulfides, *Wastewater facilities, *Wastewater treatment, Biochemical oxygen demand, Case studies, Dissolved oxygen, Environmental effects, Model studies, Odor control, Oxygen uptake, Sulfates, Suspended solids, Temperature, pH.

Five wastewater systems that experienced sulfide corrosion problems were studied. The projects selected spanned the U.S., with one project in Lakeland, Fla., and two projects each in Omaha, Neb., and Sacremento, Calif. Four of the five case studies were based on projects undertaken to investigate existing sulfide corrosion and odor problems. Each of these projects required extensive data collection and field investigation to characterize the wastewater and environmental conditions and to determine the extent of corrosion problems. The following wastewater parameters were of interest: biochemical oxygen demand (BOD) and soluble BOD, temperature, sulfate concentration, pH, dissolved oxygen (DO), oxygen uptake rate, total suspended solids, oxidation-reduction potential, and total and dissolved sulfide. In addition, hydrogen sulfide gas in the sewer atmosphere was of primary interest. In each of these five studies, sulfide and corrosion modeling was conducted to evaluate future conditions and to determine the accuracy of the models and why corrosion was occurring. In a comparison of the models with actual data, the sulfide model predicted with 50% accuracy. Making correlations on the corrosion model was more difficult because few wastewater agencies have the history of sulfide data required to make the comparison. The case studies indicated a general level of agreement with the corrosion model, certainly better than an order of magnitude. In general, municipalities have not prepared sufficiently detailed information on their successes and failures in sulfide and corrosion contr 1 to allow others to benefit. (Agostine-PTT)

SEASONAL HABITAT USE BY WALLEYE IN A WARMWATER RIVER SYSTEM, AS DETERMINED BY RADIOTELEMETRY.
Iowa Dept. of Natural Resources, Manchester. Northeast District Headquarters.
V. L. Paragamian.
North American Journal of Fisheries Management NAJMDP, Vol. 9, No. 4, p 392-401, Fall 1989. 6 fig, 2 tab, 18 ref. Federal Aid in Fish Restoration, project F-115-R.

Descriptors: *Aquatic habitats, *Fish behavior, *Iowa, *Spawning, *Stream fisheries, *Walleyes, Ceder River, Dams, Ecosystems, Seasonal distribution, Tailwater, Telemetry, Water currents, Water temperature.

Thirty-one adult walleyes, Stizostedion vitreum, were implanted with radio transmitters and tracked in the main-stem Ceder River, Iowa, and two of its tributaries from September 1986 through July 1988. The objectives were to identify specific habitat use by walleyes at various times of the year, to determine interstream movement patterns, and to identify walleye spawning sites. Fish with transmitters were located 363 times, and 92% of fish locations were within 9.7 km of a dam on the Ceder River. Walleyes preferred gravel-cobble substrates during autumn and were often in water 1.25-1.8 m deep. Overhead cover was not essential. When decreasing water temperature approached 5 C, most fish overwintered in pools 1.5-3.0 m deep. Activity of walleyes increased as spring water temperatures rose to about 2.8 C, the approximate temperature at which most walleyes moved upstream. Actual spawning took place at about 11 C and occurred in a ruffle (the tailwater of a dam) comprising large cobble and small boulders in a current of 1.4-1.5 m/s. Walleyes drifted downstream after spawning to pools 1.2-1.8 m deep and were sedentary for about 2 weeks. Several female walleyes died soon after the spawning season. During summer, walleyes preferred gravel-cobble substrates, used a variety of depths, and were near current breaks and upstream edges of pools. When summer temperatures reached 30 C, some walleyes sought deep pools. Exploitation of walleyes within the first year of the study would have been 54% if most fish had not been released by anglers. This indicated that: (1) adult walleyes preferred moderate current with cobble-gravel substrates most of the times of the year; (2) spawning occurred nearly exclusively in the tailwater of a dam; (3) walleyes were concentrated and spawned within a very short time span; (4) preferred walleye habitat is nearly nonexistent in many portions of the Ceder River system; and (5) impoundments accumulate sediment and thereby reduce walleye habitat upstream but protect habitat downstream. (Author's abstract)
W91-00009

EFFECTS OF A FIXED-CREST WEIR ON BROWN SHRIMP PENAEUS AZTECUS GROWTH, MORTALITY, AND EMIGRATION IN A LOUISIANA COASTAL MARSH.
Louisiana State Univ., Baton Rouge. School of Forestry and Wildlife Management.
E. E. Knudsen, R. F. Paille, B. D. Rodgers, and W. H. Herke.
North American Journal of Fisheries Management NAJMDP, Vol. 9, No. 4, p 411-419, Fall 1989. 4 fig, 3 tab, 31 ref.

Descriptors: *Coastal marshes, *Dam effects, *Ecological effects, *Estuaries, *Shrimp, *Water resources development, *Weirs, Animal behavior, Growth, Louisiana, Migration, Mortality.

The effects of water-control weirs on growth, emigration, and mortality of brown shrimp were investigated. Juvenile shrimp were captured, marked, and released in two shallow-water marsh ponds. One pond had a weir at its only exit. All surviving marked shrimp were recaptured as they emigrated from each pond. Shrimp remained in the weired pond 12-18 d longer after marking than in the unweired pond. Growth of brown shrimp was best described by quadratic functions and was significantly faster in the weired pond than in the unweired one although differences in growth may have been confounded by delayed emigration from the weired pond. Estimated monthly instantaneous mortality of juvenile shrimp, from marking to recapture, ranged from 0.550 to 1.582 in the weired pond, and 0.877 to 1.270 in the unweired pond and apparently varied between the years. Even though brown shrimp remained in the weired pond longer, peaks in emigrating from both ponds coincided with new and full moons. Mean total lengths of marked shrimp at emigration ranged from 83 to 106 mm for the weired pond, and from 66 to 84 mm for the unweired pond. Size of shrimp at emigration and time of emigration varied between years. Although shrimp emigrating from the weired pond were larger than those from the unweired pond, probably due to faster growth and delayed emigration, conclusions from concurrent research were that total biomass of brown shrimp emigrating from the unweired pond was more than double the biomass from the weired pond. EVALUATION OF TROUT PASSAGE THROUGH SIX HIGHWAY CULVERTS IN MONTANA.
Montana Cooperative Fishery Research Unit, Bozeman.
D. A. Belford, and W. R. Gould.
North American Journal of Fisheries Management NAJMDP, Vol. 9, No. 4, p 437-445, Fall 1989. 4 fig, 2 tab, 19 ref. Federal Highway Administration Grant 8093.

Descriptors: *Culverts, *Ecological effects, *Fish passages, *Highway effects, *Stream fisheries, *Trout, Fish behavior, Flow velocity, Highways, Montana, Water velocity.

Combination of water velocity and passage length in highway culverts were evaluated to determine conditions that enabled or prevented the passage of nonanadromous rainbow trout Oncorhynchus mykiss, brown trout Salmo trutta, cutthroat trout O. clarki, and brook trout Salvelinus fontinalis. Fish passage through six culverts 45-93 m long was determined by trapping and electrofishing. Water velocities were measured 5 cm above the bottom (bottom velocity) and at 0.6 of the water depth at intervals between rest sites throughout the lengths of the culverts. Nonlinear regression lines specific to species and state of sexual maturity were fit to the combinations of mean bottom velocity and passage length representing the most strenuous conditions that allowed the upstream passage of trout. Because of the similarity of the strenuous passage relations among species, the spawning rainbow trout relation could be used as the general criterion for passage of the trout studied. This relation indicated that fish could swim distances of 10, 30, 50, 70, and 90 m with mean bottom velocities up to 0.96, 0.80, 0.74, 0.70, and 0.67 m/s, respectively. (Author's abstract)

STREAM CANOPY AND ITS RELATIONSHIP TO SALMONID BIOMASS IN THE INTERMOUNTAIN WEST.
Forest Service, Ogden, UT. Intermountain Research Station.
W. S. Platts, and R. L. Nelson.
North American Journal of Fisheries Management NAJMDP, Vol. 9, No. 4, p 446-457, Fall 1989. 3 fig, 4 tab, 29 ref.

Descriptors: *Biomass, *Canopy, *Fish populations, *Riparian vegetation, *Salmon, *Stream fisheries, *Trout, Fish behavior, Grazing, Great Basin, Light intensity, Rocky Mountains, Thermal radiation.

To assess prevailing stream canopy (riparian overstory) conditions on representative streams in the northern Rocky Mountains, and the Great Basin of the western USA, several riparian habitats, including canopy density, light intensity, unobstructed sun arc, and average potential daily thermal input were measured in grazed and ungrazed (rested) portions of each stream. It was also determined to what extent, if any, these habitat components were correlated with salmonid biomass and whether either they or salmonids differed significantly between geographic regions or between grazed or rested pastures. Unobstructed sun arc was significantly and positively correlated with thermal input, and it was the best overall predictor of salmonid biomass per unit volume. Thermal input was a better predictor of salmonid biomass per unit volume in the Great Basin than in the Rocky Mountains, where the thermal regime may exert more influence on fish populations. Mean estimates of fish biomass per unit volume differed significantly between the Great Basin (55.9 g/cum) and Rocky Mountain (13.1 g/cum) study areas and were better related to stream canopy attributes than biomass estimates based on stream surface area; in the Great Basin study areas, the two types of biomass estimates were only weakly correlated with each other. In the Rocky Mountains, ungrazed sites generally had more canopy cover than grazed sites. In the Great Basin study areas, however, differences in canopy were unimportant and were probably related to local management practices in several cases. (Author's abstract)

Descriptors: *Aquatic habitats, *Medicine Bow National Forest, *Model studies, *Stream fisheries, *Trout, *Wyoming, Fish populations, Reach, Standing stock, Streams.

The applicability of four habitat assessment models to small trout streams in the Medicine Bow National Forest were tested. All models yielded predictions of trout standing stocks or ratings of trout cover that were correlated with measured trout standing stocks; however, the predicted and measured standing stocks were not directly proportional, and not all model variables appeared to contribute to the predictions or ratings derived from the models. Among the habitat variables included in the four models, those most highly correlated with trout standing stocks were width-to-depth ratio, abundance of overhead bank cover, average stream width, and level of late-summer streamflow. It is hypothesized that much of the variation in measured habitat and model predictions among the study reaches was due to natural variation in habitat features associated with stream size and reach gradient. SALMON STOCKS AND SALMON FISHERIES IN THE BALTIC SEA (ITAMEREN LOHIKANNAT JA LOHENKALASTUS).
Finnish Game and Fisheries Research Inst., Helsinki.
E. Ikonen, and V. Pruuki.
Suomen Kalatalous, Vol. 1990, No. 56, p 27-39, 1990. 6 tab, 47 ref. English summary.

Descriptors: *Fish management, *Fish populations, *Fish stocking, *Salmon, *Stream fisheries, Baltic Sea, Finland, Gulf of Bothnia, Smolt, Spawning.

In recent history, the salmon rivers flowing to the Baltic Sea and Gulf of Bothnia from Finland annually produced about 7 million salmon smolts. Presently, the production is < 0.5 million. The main reason for this decreased smolt production is damming of the salmon rivers. Part of the lost smolt production has been compensated for by releasing 5-6 million artificially reared salmon smolts in the river mouths. Annual salmon catches in the 1920s were 1000 tons in the sea; in the late 1980s they have been about 3500 tons. The interceptive exploitation of salmon in the sea is so effective that naturally reproducing stocks suffer greatly from the lack of spawners. If the fishing effort in the sea were decreased, the total catches would be higher and the natural stocks would survive. The Gulf of Finland annually received about 0.5 million salmon smolts in the beginning of the 1900s. Natural production is now about 15,000 and the releases of artificially reared smolts amount to 0.5 million. Due to the smolt releases the catches have increased from 100 tons in the 1970s to 300 tons. The total catch could be higher if the age of recruitment to the fishery was raised. (Author's abstract)

SALMON OF THE RIVER SIMOJOKI: RESEARCH AND MANAGEMENT (SIMOJOEN LOHI TUTKIMUKSEN JA HOIDON KOHTEENA).
Finnish Game and Fisheries Research Inst., Helsinki.
E. Jutila.
Suomen Kalatalous, Vol. 1990, No. 56, p 40-48, 1990. 2 fig, 1 tab, 21 ref. English summary.

Descriptors: *Finland, *Fish management, *Fish populations, *Fish stocking, *Salmon, *Simojoki River, *Stream fisheries, Baltic Sea, Dredging, Ecological effects, Gulf of Bothnia, Logging, Smolt, Spawning.

The last river within the Finnish borders which retains its original naturally spawning salmon stock is the Simojoki. In the 1870s the annual salmon catch from the river was about 6500 kg but during the 1970s the annual catch decreased from 1300 kg to 400 kg. During the 1980s it has been 50-200 kg. This decrease is due to the dredging of the river bed for timber floating, and overfishing of salmon in the Baltic Sea and the Gulf of Bothnia. According to capture-recapture results, in the late 1970s the annual salmon smolt production was 30,000-60,000, but during the 1980s only 1500-2000. The dredging, mostly performed in the 1950s, seriously reduced reproduction of the salmon stock. Restoration was done after the cessation of log floating, but this compensated for only about half of the damage. Still more restoration is needed in the river. Because of the increased sea fishery there have not been enough spawners to fill areas suitable for salmon fingerlings. The international regulation of the salmon fishery in the Baltic Sea has not succeeded in putting a stop to overfishing. To avoid extinction of the salmon stock in the Simojoki, stocking with parr has begun in the upper part of the river, where no salmon parr are left. Good results have been reached with releases of one-year-old parr. Currently over 60% of the salmon production of the Simojoki originates from stocking. Smolt production in the Simojoki is slightly increasing due to stocking with salmon parr and the national regulation of the sea and river fishery. (Author's abstract)

REINTRODUCTION OF SALMON AND SEA TROUT INTO THE VANTAANJOKI AND KYMIJOKI RIVERS (LOHEN JA MERITAIMENEN PALAUTTTAMINEN VANTAANJOKEEN JA KYMIJOKEEN).
Finnish Game and Fisheries Research Inst., Helsinki.
A. Saura, and J. Mikkola.
Suomen Kalatalous, Vol. 1990, No. 56, p 49-57, 1990. 6 fig, 14 ref. English summary.

Descriptors: *Finland, *Fish management, *Fish populations, *Fish stocking, *Kymijoki River, *Salmon, *Stream fisheries, *Trout, *Vantaanjoki River, Fish ladders, Fish migration, Smolt, Spawning.

The Kymijoki River was once Finland's most important salmon river flowing into the Gulf of Finland. The Vantaanjoki River was once a significant

sea trout river. The original salmonid stocks in both rivers have been destroyed as a result of damming and pollution of the rivers. In the 1970s and 1980s, environmental protection measures aimed at waters, combined with developments in salmon cultivation, provided a solid basis for an attempt at returning salmonids to the Vantaanjoki and Kymijoki rivers. Presently, 100,000 salmon and 60,000 sea trout smolts are released annually in the Vantaanjoki River, and about 300,000 salmon smolts in the Kymijoki River. In addition, salmon and trout parr of different ages have also been released in rapids in both rivers. Smolt releases have resulted in spawning migrations into the river mouths and upstream. The first fish ladders in the Vantaanjoki and Kymijoki rivers are already in use. The catch in the Vantaanjoki River mouth has been, for example, about 300-400 sea trout and 200-300 salmon annually. The river mouth catch represents for trout about 5% and for salmon about 2% of the total annual catch produced by releases in the Vantaanjoki River. The total annual salmon yield from the Langinkoski branch and the mouth of the Kymijoki River was estimated at about 25 tons. Limiting of sea fisheries would increase particular salmon catches in river mouths and upstream. When released in river rapids as 0-year-old fry, trout grow to 10 cm, and salmon to 7 cm on average in the first summer. Both salmon and trout grow to smolt size in 2 years. Regular releases have resulted in many of the experimental rapids in salmon or trout becoming the dominant species. Solely through efficient stocking of fry, the Vantaanjoki River is capable of producing about 50,000 sea trout or salmon smolts annually. The freely flowing (undammed) rapids in the Kymijoki River could produce, correspondingly, at least 100,000 salmon smolts. (Author's abstract)

CULTIVATON AND MANAGEMENT OF LANDLOCKED SALMON AND CHARR IN LAKE SAIMAA (SAIMAAN JARVILOHEN JA NIERIAN VILJELY JA HOITO).
Finnish Game and Fisheries Research Inst., Helsinki.
J. Piironen.
Suomen Kalatalous, Vol. 1990, No. 56, p 66-73, 1990. 1 fig, 3 tab, 22 ref. English summary.

Descriptors: *Char, *Finland, *Fish management, *Fish stocking, *Lake Saimaa, *Lake fisheries, *Salmon, Endangered species, Fish populations.

The presence of fish rarities--the landlocked salmon (Salmo salar m. sebago) and Arctic charr (Salvelinus alpinus)--in the Vuoksi watercourse is the consequence of events which occurred during the last glaciation period. Landlocked salmon have occurred in the whole area of Lake Saimaa, but have reproduced only in the rapids of the rivers Lieksanjoki, Pielisjoki, and Ala-Koitajoki. Arctic charr have also occurred infrequently in many lakes, but the main populations inhabit deep, oligotrophic lakes in the southern rocky belt of Lake Saimaa. Landlocked salmon became an endangered species due to construction in the rivers for hydroelectric power and dredging, which destroyed the spawning areas. Presently, Arctic charr are also very rare, although the reasons for its decrease are not as well known as for the landlocked salmon. The preservation and propagation of both stocks now depend entirely on intensive fish cultivation and stocking, but effective measures must also be found to promote natural reproduction. This article summarizes the history of culture and stocking and describes present practices and problems in the cultivation of landlocked salmon and Arctic charr. Research on the biology and culture of the two species is briefly presented. (Author's abstract)

RESEARCH ON THE FISHERIES OF SMALL LAKES (PIENTEN JARVIEN KALATUTKIMUKSET).
M. Rask, and J. Ruuhijarvi.
Suomen Kalatalous, Vol. 1990, No. 56, p 101-115, 1990. 2 fig, 4 tab, 74 ref. English summary.

Descriptors: *Finland, *Fish management, *Fish populations, *Lake fisheries, *Sport fishing, *Water pollution effects, Acidification, Carp, Crayfish, Eel, Fish stocking, Heavy metals, Mercury, Perch, Pike, Roach, Trout.

The occurrence of fish species in small Finnish lakes may be limited by colonization barriers, temporarily low oxygen concentrations in the water, high acidity or the simple structure of the habitats. The latter can result in the lack of suitable spawning, nursery or feeding sites for fish. The number of species in small lakes is generally low, the most common species being perch, pike, roach, ruffle and burbot. According to Finnish studies, the total fish biomass in small lakes tends to be 20-40 kg/ha, varying between 10 and 100 kg/ha. The highest biomasses of single species, e.g. roach, perch and crucian carp, have been 50 kg/ha. The annual fish production has been estimated to average 5-15 kg/ha. The monetary value of fish yields from small lakes is usually low, with the possible exception of crayfish, but the potential for recreational fishing may be of value. Introductions of valuable species are commonly used to increase the value of fisheries. Stocking with whitefish, bream and eel has been most successful. Introductions of rainbow trout and brown trout of catchable size seems to be a promising means of creating sport fishing waters. The most severe threat to the fisheries of small lakes is environmental degradation. Large scale problems are posed by acidification and the accumulation of mercury and other toxic substances. At the local level, silvicultural and other practices in the catchment areas may cause increasing organic or nutrient loads, which have a deleterious effect on lakes and their fisheries. WATER TEMPERATURE IN A STREAM GRAVEL BED AND IMPLICATIONS FOR SALMONID INCUBATION.
Freshwater Biological Association, Ambleside (England). Windermere Lab.
D. T. Crisp.
Freshwater Biology FWBLAB, Vol. 23, No. 3, p 601-612, June 1990. 5 fig, 3 tab, 14 ref. UK Department of the Environment Contract PECD 7/7/159.

Descriptors: *Aquatic life, *Fish, *Freshwater, *Gravel, *Incubation, *Limnology, *Salmonids, *Streambeds, *Streams, *Water temperature, England, Statistical analysis, Trout.

Water temperatures were recorded at hourly intervals in the gravel of a trout spawning area in a small stony stream at depths of 0-20 cm in 1985-86 and 0-40 cm in 1987. As depth within gravel increased, the size of the daily fluctuations reduced and their time of occurrence was delayed by about 12 min/cm in 1985-86 and about 6 min/cm in 1987. From October to February mean temperatures at 20 cm depth were, on average, 0.5 C higher than those at the gravel surface. This reflected elevated daily minima more than it reflected elevated daily maxima. From March to July daily minima were lower and daily maxima were higher in the stream than in the gravel. Consequences were: (a) an appreciable increase in mean daily range at all depths in the gravel during the summer, (b) higher daily means (by an average of about 0.4 C) in the water than in the gravel in May to August. Some implications for the early development of salmonid fish are that trout eggs incubated at 20 cm depth in gravel will hatch some 10-11 days earlier than eggs incubated at the gravel surface. However, the predicted time of eyeing of the eggs (a point in development at which they become markedly less vulnerable to mechanical shock), and of time of swim-up of the fry, differed very little between gravel depths. Because of lower temperatures at increasing depths within the gravel, deeply buried eggs would probably reach swim-up appreciably later than those from shallowly buried eggs. After hatching, the salmonids can and do move in the gravel. They are therefore potentially capable of moving along temperature gradients within the gravel in order to optimize their rate of development. (Agostine-PTT)

PATTERNS OF FISH SPAWNING IN HUDSON RIVER TRIBUTARIES: RESPONSE TO AN URBAN GRADIENT.
Cornell Univ., Ithaca, NY. Section of Ecology and Systematics.
K. E. Limburg, and R. E. Schmidt.
Ecology ECOLAR, Vol. 71, No. 4, p 1238-1245, August 1990. 6 fig, 1 tab, 20 ref. Hudson River Foundation Grant 005/87R/012.

Descriptors: *Alewife, *Anadromous fish, *Estuarine fisheries, *Hudson River, *Spawning, *Urban watersheds, Environmental gradient, Fish, Fish eggs, Regression analysis, Survival, Tributaries.

Two features of many large river watersheds, their large geographic extent and their occupation and use by humans, should render them good candidates for the manifestation of anthropogenic, ecological gradients. This study was conducted to evaluate the contribution of nontidal tributaries to anadromous fish spawning within a large, riverine estuary. The study was conducted in the watershed of the tidal Hudson River, located in eastern New York State, and 16 tributaries were selected, grouped into four geographic areas ('reaches'). A variety of data were collected, including water quality, physiography, stream characteristics, land use and geographic position in the overall watershed. All streams were sampled weekly from mid-March through June 1988, the period bracketing anadromous fish spawning in the mainstem. Multiple regression analyses were used to examine the relationship of total, anadromous, and resident species' spawning and survival in relationship to water quality parameters, physiography, and land use. Dissolved oxygen values were correlated with neither watershed area nor mean depth at the sampling site, but were both spatially and temporally more variable with increasing land under urbanized use. Spawning activity was highly regionalized, with the vast majority of eggs and larvae collected in three streams in one reach. A total of 23 species was collected, but alewife (Alosa pseudoharengus), composed 93% of the catch. The strongest and most consistent relationship was between densities of eggs and larvae and the index of urbanization, with the data demonstrating a strong threshold effect of urbanization on anadromous spawning success. Salt front location in the Hudson mainstem was not significantly correlated with spawning. The proximal causes of spawning variability result, at least in part, from some aspects of urbanization. A model was developed to predict the probability of establishing a reproducing population of walleye (Stizostedion vitreum) in lakes and reservoirs in North America. A list of 542 lakes of reservoirs where walleye stocking occurred was obtained by questionnaire survey. Water quality and morphometric data for these systems were obtained from STORET, the national computer data base of the Environmental Protection Agency, and various reports. Two stepwise discriminate analyses were performed on normalized data; the variables area, maximum depth, and pH were found to be significantly related to walleye success in lakes. In addition, the variable date of dam closure was included in the reservoir data set. Using a jackknife discriminate analysis, 71% of the lakes and 72% of the reservoirs were classified correctly. Use of the model increases the probability of predicting the establishment of a self-sustaining walleye population by about 20%. (Author's abstract)

The feeding conditions encountered by a population of silver carp introduced into a eutrophic lake were evaluated. Five qualitative and quantitative investigations on the phytoplankton and zooplankton composition were carried out during the 1976 growing season. The biomass of phytoplankton was high during the study period, reaching 14.3 to 34.1 mg/L. A quantitative and qualitative analysis of the phytoplankton composition, especially of the blue-green algae which (at high concentrations) can cause perturbations in fish feeding, showed that the algae were not too abundant and no danger of algal toxins was present. The biomass of zooplankton was also high (over 10 mg/L) and declined (to 1.7 mg/L) only towards the end of June, when fish feeding was intensive. The abundance and fractional size of the zooplankton was satisfactory throughout the growing season. Feeding conditions in the lake under study were favorable for the development of the introduced silver carp population. (See also W91-00784 and W91-00785) (Author's abstract)

Qualitative and quantitative investigations were carried out on the feeding preferences of a silver carp population aged 3+ introduced into a eutrophic lake of known food conditions. Samples were taken five times during the algal growing season at periods coinciding with phytoplankton and zooplankton investigations. Silver carp feed mainly on detritus with phytoplankton and zooplankton making up the balance of the diet. The percentage of zooplankton in the diet was, at times, higher than of the phytoplankton. Feeding intensity was dependent upon thermal conditions and independent of food abundance. Analyses of feeding selectivity showed that silver carp fed on phytoplankton indiscriminantly, consuming all the blue-green algal species found in the lake, but distinct preferences were shown towards small zooplankton taxa. Rotifers and cladocerans were preferred over copepods. The feeding behavior of the silver carp population has a definite impact on the population dynamics and faunal composition of the lake. An attempt was made to evaluate the impact of the silver carp population introduced into a eutrophic lake on the plankton biocenosis. On the basis of investigations on the plant and animal plankton an estimation was made of phytoplankton and zooplankton production in the lake, and on their consumption by the introduced fish population. Calculations were made of indices to show utilization of plankton biomass as food by the fish. Utilization of plankton biomass for fish consumption may reach a maximum of 5% for zooplankton and 1% for phytoplankton. Plankton biomass capable of being converted to usable energy by the fish was respectively lower: for zooplankton, around 0.6%; for phytoplankton, around 0.1%. The impact of the fish population on the plankton biocenosis was only slight, making it feasible to increase the level of fish stocking in the lake. Further investigations should be carried out at increased stocking with fish and for longer periods of time. (See also W91-00783 and W91-00784) (Author's abstract)

SPATIAL AND TEMPORAL VARIATION IN FISHES OF RIFFLE HABITATS: A COMPARISON OF ANALYTICAL APPROACHES FOR THE ROANOKE RIVER.
Oklahoma Univ., Kingston. Biological Station.
W. J. Matthews.
American Midland Naturalist AMNAAF, Vol. 124, No. 1, p 31-45, July 1990. 3 fig, 5 tab, 33 ref, append.

Descriptors: *Fish populations, *Riffles, *Roanoke River, *Virginia, Bottom sampling, Cluster analysis, Darters, Data acquisition, Fish behavior, Multivariate analysis, Sampling techniques, Seasonal variation, Spatial distribution, Statistical analysis, Temporal distribution.

Spatial and temporal variation in fishes in riffles of the upper Roanoke River system (Virginia) were analyzed in three ways: a two-way (space-time) analysis of variance (ANOVA) of species abundance; a comparison of spatially adjacent and temporally consecutive fish assemblages by Morisita's index of similarity; and comparison of all space x time samples by cluster analysis. At six sites on the river mainstream or large tributaries, fish in riffles were collected by kickset sampling in five surveys from May to November 1978. For species with significant differences in abundance across space or time, variance components were combined into ratios that show relative importance of 'temporal,' 'fixed spatial' and 'ephemeral spatial' effects. The ANOVA was carried out on individual species, but Morisita's index and the cluster analysis were calculated for the entire assemblage of riffle fishes in each sample. Four of the nine most common species (three benthic darters and one sucker) exhibited significant spatial and/or temporal variance, with more of the variance accounted for by spatial than by temporal differences. For two of the four species, the spatial variance was primarily ephemeral, but for the other two spatial variance was

persistent (fixed). Results of the cluster analysis reinforced for whole assemblages the patterns detected for individual species, in that more within-site than within-time similarity existed. Comparison of adjacent and temporally consecutive sites by Morisita's index produced results differing somewhat from those of the first two analyses, in that spatial and temporal differences in assemblages appeared essentially equal. Each of the analytical approaches provided a somewhat different view of sources of spatial and temporal variation in riffle fishes of this stream system, but the overall conclusion was that spatial variation generally exceeded temporal variation. The results suggested that to adequately survey fish of riffles in this or similar systems it may be better to increase the total number of sampling sites, than to increase the number of collections per site. Atmospheric Chemistry of Peroxides: A Review.
W91-00841 5B

Wet and Dry Deposition Fluxes Above the North Sea.
W91-00845 2B

Intensive Studies of Sierra Nevada Cloudwater Chemistry and Its Relationship to Precursor Aerosol and Gas Concentrations.
W91-00846 2B

Effect of Daytime Surface Evaporation on Pollution Dispersion.
W91-00848 5B

Chemical Characterization of Acid Precipitation in Albany, New York.
W91-00850 5A

Source-Receptor Relationships for Wet SO4(2-) and NO3(-) Production.
W91-00851 5B

Trace Metal Wet Deposition in Sweden: Insight Gained from Daily Wet Only Collection.
W91-00853 5B

Chemical Composition Differences in Fog and Cloud Droplets of Different Sizes.
W91-00854 2B

AIR POLLUTION SOURCES
Effect of Daytime Surface Evaporation on Pollution Dispersion.
W91-00848 5B

Chemical Characterization of Acid Precipitation in Albany, New York.
W91-00850 5A

AIR STRIPPING
Air Stripping and Steam Stripping.
W91-00919 5D

AIR TEMPERATURE
Empirical Data on Contemporary Global Climate Changes (Temperature and Precipitation).
W91-00146 2B

AIR-WATER INTERFACES
Measurements of Gas Concentration Fluctuations at Water Surface.
W91-00065 2K

Gas Exchange Rates for a First-Order Stream Determined with Deliberate and Natural Tracers.
W91-00606 2A

ALACHLOR
Ozonation of Alachlor: Effects and Suitability as a Treatment Technology.
W91-00543 5F

ALASKA
Siphon Quenches.
W91-00142 8A

ALEWIFE
Patterns of Fish Spawning in Hudson River Tributaries: Response to an Urban Gradient.
W91-00617 8I

ALGAE
Aspects of Carbon Metabolism in the Recovery of Selenastrum capricornutum Populations Exposed to Cadmium.
W91-00191 5C

Modeling the Effect of Algal Biomass on Multispecies Aquatic Microcosms Response to Copper Toxicity.
W91-00197 5C

Short-Term Productivity Responses of Algae and Bacteria to Zooplankton Grazing in Two Freshwater Lakes.
W91-00418 2H

Interactions Among Nutrients, Algae and Invertebrates in a New Zealand Mountain Stream.
W91-00422 2E

Benthic Turfs vs Floating Mats of Algae in River Food Webs.
W91-00708 2H

Photosynthesis of Dunaliella parva Lerche as a Function of Temperature, Light and Salinity.
W91-00750 2H

Seasonal Variation of Sirodotia delicatula Skuja (Rhodophyta, Batrachospermaceae) in a Small Stream From Sao Paulo State, Southeastern Brazil.
W91-00782 2H

Studies on the Algae of a Small Softwater Stream I. Occurrence and Distribution with Particular Reference to the Diatoms.
W91-00869 2H

Studies on the Algae of a Small Softwater Stream II. Algal Standing Crop (Measured by Chlorophyll-a) on Soft and Hard Substrata.
W91-00870 2H

Studies on the Algae of a Small Softwater Stream III. Interaction between Discharge, Sediment Composition and Diatom Flora.
W91-00871 2H

ALGAL BLOOMS
Moses Lake Clean Lake Project. Final Stage 3 Report.
W91-00554 5G

Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

ALGAL CONTROL
Reduction of Phosphorus and Chlorophyll a Concentrations Following CaCO3 and Ca(OH)2 Additions to Hypereutrophic Figure Eight Lake, Alberta, Canada.
W91-00625 5F

N-Carboxymethylchitosan: Algistatic and Algicidal Properties.
W91-00837 5F

ALGAL GROWTH
Microcystin Composition of an Axenic Clonal Strain of Microcystis viridis and Microcystis viridis-Containing Waterblooms in Japanese Freshwaters.
W91-00699 5C

ALGAL PHYSIOLOGY
Radioactivity Level of Black Sea Marine Algae Before and After the Chernobyl Accident.
W91-00796 5B

ALGAL TOXINS
Microcystin Composition of an Axenic Clonal Strain of Microcystis viridis and Microcystis viridis-Containing Waterblooms in Japanese Freshwaters.
W91-00699 5C

ALGICIDES
N-Carboxymethylchitosan: Algistatic and Algicidal Properties.
W91-00837 5F

ALKALINE SOILS
Estimates of Evapotranspiration in Alkaline Scrub and Meadow Communities of Owens Valley, California, Using the Bowen-Ratio, Eddy-Correlation, and Penman-Combination Methods.
W91-00333 2D

ALLUVIAL AQUIFERS
Groundwater Modelling as a Tool for Water Management: Waimea Plains, Nelson.
W91-00075 2F

ALLUVIAL CHANNELS
Velocity Distribution in Alluvial Channel Flow.
W91-00036 8B

Design of Stable Alluvial Channels.
W91-00154 2J

2-D Bed Evolution in Natural Watercourses: New Simulation Approach.
W91-00177 2J

Constraints on Duration of Sediment Storage in a Wide, Gravel-Bed River, New Zealand.
W91-00298 2J

Coupled Simulation of Transient Bed Evolution in Alluvial Channels.
W91-00407 2J

ALPINE REGIONS
Hydrologic and Hydraulic Research in Mountain Rivers.
W91-00083 2E

Effects of Climate Change on Snowmelt Runoff Patterns.
W91-00458 2C

Radar Data Processing for Hydrology in the Cevennes Region.
W91-00466 7B

Some Characteristics of Springs in High Elevation Alteritic Material: Their Contribution to the Understanding of the Intricacy of the Two-Layered 'Sand-Basement' Aquifer (Madagascar High Plateaux) (Caracteristiques d'Emergences en Milieu Alteritique d'Altitude: Leur Apport a la Comprehension de l'Aquifere Bicouche Arenes-socle (Hauts Plateaux de Madagascar)).
W91-00856 2F

ALTERNATIVE PLANNING
Control and Disposal Indices for Comparing Waste-Management Alternatives.
W91-00959 5E

ALUMINUM
Effect of Humic Substances on the Toxicity of Aluminum to Adult Rainbow Trout, Oncorhynchus mykiss (Walbaum).
W91-00371 5C

Comparative Analysis of Aluminum Biogeochemistry in a Northeastern and a Southeastern Forested Watershed.
W91-00590 2K

Plasma Electrolytes, Gill Aluminum Content, and Gill Morphology of Juvenile Atlantic Salmon (Salmo salar) and Brook Trout (Salvelinus fontinalis) Indigenous to Acidic Streams of Nova Scotia.
W91-00616 5C

Effect of Fluoride Complexation on Aluminum Toxicity Towards Juvenile Atlantic Salmon (Salmo salar).
W91-00663 5C

Effects of Catchment Liming and Afforestation on the Concentration and Fractional Composition of Aluminum in the Loch Fleet Catchment, SW Scotland.
W91-00897 5G

AMAZON RIVER
Water Chemistry of the Solimoes/Amazon River (A Hidroquimica do Rio Solimoes/Amazonas).
W91-00820 2K

AMERICAN INSTITUTE OF HYDROLOGY
American Institute of Hydrology.
W91-00269 6E

AMERICAN INSTITUTE OF PROFESSIONAL GEOL
American Institute of Professional Geologists: Competence, Integrity, Ethics.
W91-00271 6E

AMERICAN METEOROLOGICAL SOCIETY
Certification in the American Meteorological Society.
W91-00272 6E

AMERICAN SOCIETY FOR PHOTOGRAMMETRY AND
American Society for Photogrammetry and Remote Sensing Voluntary Certification Program.
W91-00274 6E

AMES TEST
Evaluation of Protocol for Preparing Drinking Water Samples for Ames Mutagenicity Testing.
W91-00496 5A

AMINO ACIDS
Production of Organic Chemicals and Mutagens during Chlorination of Amino Acids in Water.
W91-00485 5F

Inactivation of E. coli Suspension by Chlorine: Implication of Chlorination of Alpha-Amino Acids and Uracil.
W91-00535 5F

AMMONIA
Ambient Ammonia, Diet and Growth in Lake Trout.
W91-00200 5C

Trihalomethane Formation and Distribution in Bromide-Rich and Ammonia-Containing Lake Water.
W91-00526 5B

Intensive Studies of Sierra Nevada Cloudwater Chemistry and Its Relationship to Precursor Aerosol and Gas Concentrations.
W91-00846 2B

AMMONIUM
Transformation and Transport of Ammonium Nitrogen in a Flooded Organic Soil.
W91-00716 5B

Intensive Studies of Sierra Nevada Cloudwater Chemistry and Its Relationship to Precursor Aerosol and Gas Concentrations.
W91-00846 2B

AMMONIUM SALTS
Simulation of Nitrate Nitrogen Breakthrough Curves Stemming from Leaching of Ammonium Nitrate Through Soil.
W91-00896 5B

AMPEROMETRY
Chloramine Interference in the Measurement of Free Chlorine by the Amperometric Membrane Electrode.
W91-00537 7B

AMPHIPODS
Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Colonization of Amphipods and Polychaetes to Sediments Experimentally Exposed to Oil Hydrocarbons.
W91-00707 5C

ANADROMOUS FISH
Patterns of Fish Spawning in Hudson River Tributaries: Response to an Urban Gradient.
W91-00617 8I

ANAEROBIC BACTERIA
Measurement of In Situ Rates of Selenate Removal by Dissimilatory Bacterial Reduction in Sediments.
W91-00620 5B

ANAEROBIC DIGESTION
Improved Performance of Upflow Anaerobic Sludge Blanket (UASB) Reactors by Operating Alternatives.
W91-00416 5D

Growth of Biopellets on Glucose in Upflow Anaerobic Sludge Bed (UASB) Systems.
W91-00631 5D

Effect of Nitrogen Limitation on Pelletisation in Upflow Anaerobic Sludge Bed Systems.
W91-00632 5D

Pelletisation in a UASB System with Protein (Casein) as Substrate.
W91-00633 5D

Comparison of Media Types in Acetate Fed Expanded-Bed Anaerobic Reactors.
W91-00806 5D

Study of Phosphatase Activity in Anaerobic Sludge Digestion.
W91-00817 5D

Anaerobic Digestion.
W91-00944 5D

ANALYTICAL METHODS
Determination of Gold at Femtomolar Levels in Natural Waters by Flow Injection Inductively Coupled Plasma Quadrupole Mass Spectrometry.
W91-00388 2K

Determination of Chloroaniline Traces in Environmental Waters by Selective Extraction with Two Traps in Tandem and Liquid Chromatography.
W91-00389 5A

Automated High-Performance Liquid Chromatography for the Determination of Pesticides in Water Using Solid Phase Extraction.
W91-00390 5A

Performance Evaluation Materials for the Analysis of Volatile Organic Contaminants in Soil: A Preliminary Assessment.
W91-00393 5A

Solubility of Oxygen in the Dead Sea Brine.
W91-00744 2K

Environmental Russian Roulette: Compliance at or Near the Detection Level.
W91-00802 5G

Further Discussion on the Intercomparison of the Trace Metal Concentrations and Particle Size of Fluvial Sediment Recovered from Two Centrifuge Systems.
W91-00866 5A

ANALYTICAL TECHNIQUES
Use of Membrane Extraction Disks for On-Line Trace Enrichment of Organic Compounds from Aqueous Samples.
W91-00839 5A

Further Discussion on the Intercomparison of the Trace Metal Concentrations and Particle Size of Fluvial Sediment Recovered from Two Centrifuge Systems.
W91-00866 5A

ANIMAL BEHAVIOR
Behavioral Changes in Gammarus pulex and Its Significance in the Toxicity Assessment of Very Low Levels of Environmental Pollutants.
W91-00207 5C

Predation on and by Pelagic Turbellaria in Some Lakes in Brazil.
W91-00695 2H

ANIMAL GROWTH
Rapid Method for Assessing Growth Rates of Coral in Relation to Water Pollution.
W91-00705 5A

ANIMAL METABOLISM
Model of Organic Chemical Uptake and Clearance by Fish from Food and Water.
W91-00622 5B

Using Seabirds to Monitor Mercury in Marine Environments: The Validity of Conversion Ratios for Tissue Comparisons.
W91-00704 5B

ANIMAL PATHOLOGY
Gonadal Histopathology Following Nickel Intoxication in the Giant Gaurami Colisa fasciatus (Bloch and Schneider), a Freshwater Tropical Perch.
W91-00213 5C

ANIMAL PHYSIOLOGY
Effect of Drinking Water Containing Chlorine and Monochloramine on Cholesterol and Triglyceride Levels in the Liver of the Pigeon and Rabbit.
W91-00500 5C

Cyclomorphosis in Daphnia: An Adaptation to Avoid Invertebrate Predation.
W91-00696 2H

Colonization of Amphipods and Polychaetes to Sediments Experimentally Exposed to Oil Hydrocarbons.
W91-00707 5C

ANNUAL REPORTS
Report of the River Master of the Delaware River for the Period December 1, 1987 - November 30, 1988.
W91-00344 2E

ANTIBIOTICS
Resistance to Antibiotics and Heavy Metals of Pseudomonas aeruginosa Isolated from Natural Waters.
W91-00698 5C

AQUACULTURE
Water Quality in the Barycz River and Its Tributaries Within the Area of the Low Silesian Commercial Fishery Farm in Milicz (Jakosc Wody Rzeki Baryczy i Jej Doplywow na Obsazarze Dolnoslaskiego Kombinatu Rybackiego).
W91-00734 5B

AQUATIC ANIMALS
Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Distribution and Abundance of Littoral Benthic Fauna in Canadian Prairie Saline Lakes.
W91-00751 2H

AQUATIC BACTERIA
Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

Microbiological Investigations of Lake Niegocin (Badania Mikrobiologiczne Jeziora Niegocin).
W91-00787 5B

Iron-Binding Compounds and Related Outer Membrane Proteins in Vibrio cholerae Non-O1 Strains from Aquatic Environments.
W91-00830 5B

AQUATIC ECOSYSTEMS
Resistance of Lotic Ecosystems to a Light Elimination Disturbance: A Laboratory Stream Study.
W91-00709 2H

AQUATIC HABITATS
Seasonal Habitat Use by Walleye in a Warmwater River System, as Determined by Radiotelemetry.
W91-00009 8I

Testing of Habitat Assessment Models for Small Trout Streams in the Medicine Bow National Forest, Wyoming.
W91-00014 8I

Macrophyte Associated Invertebrates and the Effect of Habitat Permanence.
W91-00052 2H

Fate of Aquatic and Wetland Habitats in an Industrially Contaminated Section of the Elbe Floodplain in Hamburg.
W91-00648 5B

Physicochemistry and Vegetation of Piccaninnie Ponds, a Coastal Aquifer-Fed Pond in Southeastern South Australia.
W91-00653 2H

Distribution and Abundance of the Alkali Fly (Ephydra hians) Say at Mono Lake, California (USA) in Relation to Physical Habitat.
W91-00752 2H

Studies on the Algae of a Small Softwater Stream I. Occurrence and Distribution with Particular Reference to the Diatoms.
W91-00869 2H

Studies on the Algae of a Small Softwater Stream II. Algal Standing Crop (Measured by Chlorophyll-a) on Soft and Hard Substrata.
W91-00870 2H

Studies on the Algae of a Small Softwater Stream III. Interaction between Discharge, Sediment Composition and Diatom Flora.
W91-00871 2H

AQUATIC INSECTS

Ecology of Marine Benthic Dipterans in a Tidal Creek of Hooghly Estuary, Sagar Island, India.
W91-00051 2L

Distribution and Abundance of the Alkali Fly (Ephydra hians) Say at Mono Lake, California (USA) in Relation to Physical Habitat.
W91-00752 2H

AQUATIC LIFE

Reconnaissance Investigation of Water Quality, Bottom Sediment, and Biota Associated with Irrigation Drainage in and near Stillwater Wildlife Management Area, Churchill County, Nevada, 1986-87.
W91-00351 5C

Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

Responses of Zooplankton and Zoobenthos to Experimental Acidification in a High-Elevation Lake (Sierra Nevada, California, U.S.A).
W91-00425 5C

Water Temperature in a Stream Gravel Bed and Implications for Salmonid Incubation.
W91-00427 8I

Manipulating Lake Community Structure: Where Do We Go from Here.
W91-00428 2H

AQUATIC PLANTS

Physicochemistry and Vegetation of Piccaninnie Ponds, a Coastal Aquifer-Fed Pond in Southeastern South Australia.
W91-00653 2H

Degradation of Polyphenols in Five Plant Species in the Aquatic Environment (Degradacao de Ploifenois em Cinco Especies Vegetais em Ambientes Aquaticos).
W91-00821 2H

Increase in the Oxygen Concentration in Amazon Waters Resulting from the Root Exudation of Two Notorious Water Plants, Eichhornia crassipes (Pontederiaceae) and Pistia stratiotes (Araceae).
W91-00822 2H

Carbon and Nitrogen Transformations in Wastewater During Treatment with Hydrocotyle umbellata L.
W91-00834 5D

Tolerance of Scapania undulata (L.)Dum. to Fluoride.
W91-00835 5C

Effect of Water Depth and Clipping Frequency on the Growth and Survival of Four Wetland Plant Species.
W91-00836 2J

AQUATIC PRODUCTIVITY

Production and Decomposition in a Saline Meromictic Lake.
W91-00746 2H

AQUATIC WEED CONTROL

Vegetative Growth of Spirodela polyrrhiza as Affected by Medium Concentration, Daylight Intensity and Age.
W91-00684 2H

AQUIFER CHARACTERISTICS

Aquifers of the Western Mountain Area.
W91-00304 2F

Regional Bedrock Aquifers of the Northern Great Plains, North-Central United States.
W91-00305 2F

Snake River Plain Regional Aquifer System Study.
W91-00306 2F

Ground-Water Flow Systems of Western Utah.
W91-00307 2F

Upper Colorado River Basin Regional Aquifer-Systems Analysis: Mesozoic Rocks in Colorado, Utah, and Wyoming, Arizona, and New Mexico.
W91-00308 2F

Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Lithologic and Hydrologic Properties of Mesozoic Rocks in the Upper Colorado River Basin.
W91-00310 2F

Hydrology of the Navajo Sandstone in Southeastern and Southern Utah.
W91-00311 2F

Geochemistry of Water Associated with the Navajo Sandstone Aquifer, San Rafael Swell Area, Utah.
W91-00312 2F

Hydrostratigraphic Characterization of Paleozoic Formations in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00313 2F

Geophysically Determined Porosity of Paleozoic Rocks in the Upper Colorado River Basin.
W91-00314 2F

Porosity and Permeability of the Paleozoic Rocks in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00315 2F

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

Geohydrology and Regional Ground-Water Flow of the Coastal Lowlands Aquifer System in Parts of Louisiana, Mississippi, Alabama, and Florida--A Preliminary Analysis.
W91-00332 2F

Ground-Water Resources of the Arkansas River Basin in Arkansas.
W91-00355 2F

Ground-Water Conditions in Las Vegas Valley, Clark County, Nevada. Part 1: Hydrogeologic Framework.
W91-00429 2F

Specific Storage as a Poroelastic Coefficient.
W91-00607 2F

Some Characteristics of Springs in High Elevation Alteritic Material: Their Contribution to the Understanding of the Intricacy of the Two-Layered 'Sand-Basement' Aquifer (Madagascar High Plateaux) (Caracteristiques d'Emergences en Milieu Alteritique d'Altitude: Leur Apport a la Comprehension de l'Aquifere Bicouche Arenes-socle (Hauts Plateaux de Madagascar)).
W91-00856 2F

Effects of Faults on Fluid Flow and Chloride Contamination in a Carbonate Aquifer System.
W91-00877 2F

AQUIFER MANAGEMENT

Optimal Planning and Operation of Multiaquifer System.
W91-00179 4B

AQUIFER SYSTEMS

Aquifers of the Western Mountain Area.
W91-00304 2F

Regional Bedrock Aquifers of the Northern Great Plains, North-Central United States.
W91-00305 2F

Snake River Plain Regional Aquifer System Study.
W91-00306 2F

Ground-Water Flow Systems of Western Utah.
W91-00307 2F

Upper Colorado River Basin Regional Aquifer-Systems Analysis: Mesozoic Rocks in Colorado, Utah, and Wyoming, Arizona, and New Mexico.
W91-00308 2F

Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Lithologic and Hydrologic Properties of Mesozoic Rocks in the Upper Colorado River Basin.
W91-00310 2F

Hydrology of the Navajo Sandstone in Southeastern and Southern Utah.
W91-00311 2F

Hydrostratigraphic Characterization of Paleozoic Formations in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00313 2F

Porosity and Permeability of the Paleozoic Rocks in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00315 2F

Hydrogeology of the Dinaric Karst.
W91-00318 2F

Geology of Karst Terrains and Theory in the Works of Jovan Cvijic.
W91-00319 8E

Hydrogeologic Regional Classification of Karst in Yugoslavia.
W91-00320 2F

Hydrogeologic Features of the Dinaric Karst.
W91-00321 2F

Speleological Phenomena of Dinaric Karst.
W91-00322 2F

Karst Poljes in Dinarides.
W91-00323 2F

Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

Problems of Sea Water Intrusion into Aquifers of the Coastal Dinaric Karst.
W91-00325 2F

Application of Geophysical Methods to Hydrogeological Problems in Dinaric Karst of Yugoslavia.
W91-00326 7B

Some Methods of Hydrogeologic Exploration and Water Regulation in the Dinaric Karst with Special Reference to Their Application in Eastern Herzegovina.
W91-00327 2F

Hydrogeologic Features of Typical Karst Terrains in Montenegro.
W91-00328 2F

Hydrogeological Features of Some Northern Dalmatia Littoral Karst Parts, Lika and Croatian Littoral.
W91-00329 2F

Hydrogeologic Features of Some Karst Parts of Slovenia.
W91-00330 2F

Geohydrology and Regional Ground-Water Flow of the Coastal Lowlands Aquifer System in Parts of Louisiana, Mississippi, Alabama, and Florida--A Preliminary Analysis.
W91-00332 2F

Geohydrology and Simulated Effects of Pumpage on the New Orleans Aquifer System at New Orleans, Louisiana.
W91-00348 2F

Exact Solution for Flow of Slightly Compressible Fluids Through Multiple-Porosity, Multiple-Permeability Media.
W91-00588 2F

AQUIFER TESTING

Pumping Test in a Low Permeability Claystone Aquifer Executed with High-Resolution Electronic Water Level Recorders and Evaluated with the Versatile Computer Program HYDROPAR.
W91-00216 2F

Analysis of Pumping Test Data from Borewells in Fractured Rocks of Karnataka.
W91-00217 2F

Computation of Transmissivity from Step-Drawdown Tests.
W91-00220 2F

AQUIFERS

Pumping Test in a Low Permeability Claystone Aquifer Executed with High-Resolution Electronic Water Level Recorders and Evaluated with the Versatile Computer Program HYDROPAR.
W91-00216 2F

Analysis of Test Pumping Data from Unconfined Aquifers by Simulation.
W91-00218 2F

Critical Evaluation of Pumping Test Data from Fractured Crystalline Formation.
W91-00219 2F

Appropriate Well Design for Developing Fresh Water Aquifer in a Mixed Quality Aquifer System.
W91-00221 8A

Approach in Determination of Aquifer Geometry and Estimation of Aquifer Parameters of an Areally Extensive Upper Kamthi Sandstone Aquifer in Parts of Godavari Valley, Andhra Pradesh.
W91-00231 2F

Aquifer Parameter Estimation and Groundwater Potentiality in Granite-Basalt Terrain Near Hyderabad, India.
W91-00233 2F

More Accurate Determination of Aquifer Parameters Using the IP Sounding Method.
W91-00238 7B

Hydrogeophysical Studies for Characterizing the Crystalline Aquifers of Tambraparni Basin, Tamil Nadu, India.
W91-00242 2F

Kriged Estimates of Water-Levels from the Sparse Measurements in a Hard Rock Aquifer.
W91-00245 2F

Techniques of Aquifer Parameter Evaluation Using Pocket Computers.
W91-00265 2F

Acquisition of Hydrogeologic Data for the Mapping of Shallow Unconfined Deccan Basaltic Aquifers from Maharashtra, India.
W91-00266 2F

Aquifers of the Western Mountain Area.
W91-00304 2F

Regional Bedrock Aquifers of the Northern Great Plains, North-Central United States.
W91-00305 2F

Snake River Plain Regional Aquifer System Study.
W91-00306 2F

Ground-Water Flow Systems of Western Utah.
W91-00307 2F

Upper Colorado River Basin Regional Aquifer-Systems Analysis: Mesozoic Rocks in Colorado, Utah, and Wyoming, Arizona, and New Mexico.
W91-00308 2F

Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Hydrology of the Navajo Sandstone in Southeastern and Southern Utah.
W91-00311 2F

Geochemistry of Water Associated with the Navajo Sandstone Aquifer, San Rafael Swell Area, Utah.
W91-00312 2F

Hydrostratigraphic Characterization of Paleozoic Formations in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00313 2F

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

Geology of Karst Terrains and Theory in the Works of Jovan Cvijic.
W91-00319 8E

Hydrogeologic Regional Classification of Karst in Yugoslavia.
W91-00320 2F

Hydrogeologic Features of the Dinaric Karst.
W91-00321 2F

Speleological Phenomena of Dinaric Karst.
W91-00322 2F

Specific Storage as a Poroelastic Coefficient.
W91-00607 2F

Theory and Application of an Approximate Model of Saltwater Upconing in Aquifers.
W91-00883 2F

Motion of Coastal Groundwater in Response to the Tide.
W91-00884 2F

Classification of Shallow Groundwater Types in a Dutch Coversand Landscape.
W91-00895 2K

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

ARCH DAMS

Three-Dimensional Boundary Element Reservoir Model for Seismic Analysis of Arch and Gravity Dams.
W91-00123 8D

ARGENTINA

Influence of Sewage Pollution on a Rocky Intertidal Community Dominated by the Mytilid Brachidontes rodriguezi.
W91-00764 5C

Chemical Characteristics of the Water of Chascomus Pond (Provincia de Buenos Aires, Argentina): Limnological Implications (Caracteristicas Quimicas das Aguas da Lagoa de Chascomus (Provincia de Buenos Aires, Argentina). Implicancias Limnologicas).
W91-00781 2H

ARID-ZONE HYDROLOGY

Evaluation of Three Evapotranspiration Models in Terms of Their Applicability for an Arid Region.
W91-00165 2D

ARIZONA

Professional Registration for Hydrologists in Arizona: A Proposal Prepared by the Arizona Hydrological Society.
W91-00278 6E

Ground Water Recharge and Pollution Potential of Dry Wells in Pima County, Arizona.
W91-00367 5B

ARKANSAS

Ground-Water Resources of the Arkansas River Basin in Arkansas.
W91-00355 2F

Annual Yield and Selected Hydrologic Data for the Arkansas River Basin Compact Arkansas--Oklahoma 1989 Water Year.
W91-00360 2E

ARKANSAS RIVER BASIN

Annual Yield and Selected Hydrologic Data for the Arkansas River Basin Compact Arkansas--Oklahoma 1989 Water Year.
W91-00360 2E

ARKANSAS RIVER BASIN COMPACT

Annual Yield and Selected Hydrologic Data for the Arkansas River Basin Compact Arkansas--Oklahoma 1989 Water Year.
W91-00360 2E

AROMATIC COMPOUNDS

Comparative QSAR Study on Freshwater and Estuarine Toxicity.
W91-00195 5C

ARROYOS
Significance of Sediment Transport in Arroyo Development.
W91-00346 2J

ARSENIC
Arsenic-induced Ultrastructural Changes in the Vegetative Cells of Cystoseira barbata forma repens Zinova et Kalugina (Fucophyceae, Fucales).
W91-00202 5C

Transport of Mine Tailings as Suspended Sediment in the Belle Fourche River, West-Central South Dakota, USA.
W91-00283 5B

ARSENIC COMPOUNDS
Arsenate Sensitivity in Marine Periphyton Communities Established Under Various Nutrient Regimes.
W91-00700 5C

ARTESIAN AQUIFERS
Approach in Determination of Aquifer Geometry and Estimation of Aquifer Parameters of an Areally Extensive Upper Kamthi Sandstone Aquifer in Parts of Godavari Valley, Andhra Pradesh.
W91-00231 2F

ARTIFICIAL PRECIPITATION
Estimated Runoff from Man-Made Snow.
W91-00092 2C

ARTIFICIAL RECHARGE
Groundwater Recharge with Reclaimed Water in California.
W91-00800 4B

Water Banking Through Artificial Recharge, Las Vegas Valley, Clark County, Nevada.
W91-00880 4B

ASBESTOS
Functional and Pathological Impairment of Japanese Medaka (Oryzias latipes) by Long-term Asbestos Exposure.
W91-00199 5C

ASH
Wet Deposition of Volcanic Gases and Ash in the Vicinity of Mount Sakurajima.
W91-00669 5B

ASIA
Potential Coastal Impacts of Contemporary Changing Climate on South Asian Seas States.
W91-00027 4C

ATCHAFALAYA RIVER
Hysteresis and Nonlinearity of Discharge-Sediment Relationships in the Atchafalaya and Lower Mississippi Rivers.
W91-00292 2J

ATMOSPHERIC CHEMISTRY
Acid Precursor Concentrations Above the Northeastern United States during Summer 1987: Three Case Studies.
W91-00148 5B

Atmospheric Chemistry of Peroxides: A Review.
W91-00841 5B

Wet and Dry Deposition Fluxes Above the North Sea.
W91-00845 2B

ATMOSPHERIC CIRCULATION
One-dimensional Interactive Soil-atmosphere Model for Testing Formulations of Surface Hydrology.
W91-00145 2A

Effect of Global-Scale Divergent Circulation on the Atmospheric Water Vapor Transport and Maintenance.
W91-00577 2B

ATMOSPHERIC WATER
MECA Workshop on Atmospheric H2O Observations of Earth and Mars.
W91-00576 7B

Effect of Global-Scale Divergent Circulation on the Atmospheric Water Vapor Transport and Maintenance.
W91-00577 2B

Cumulus Convection and Terrestrial Water-Vapor Distribution.
W91-00578 2B

Observations of Atmospheric Water Vapor with the SAGE II Instrument.
W91-00579 7B

Measurements of H2O in the Terrestrial Mesosphere and Implications for Extra-Terrestrial Sources.
W91-00580 2B

NIMBUS 7 LIMS Water Vapor Measurements.
W91-00581 2B

Radiometric Studies of Clear Air Attenuation and Atmospheric Water Vapor at 22.235 GHz over Calcutta (Lat. 22 degrees 32 minutes N, Long. 88 degrees 20 minutes E).
W91-00852 2B

ATRAZINE
Movement and Fate of Atrazine and Bromide in Central Kansas Croplands.
W91-00882 5B

AUSTRALIA
Water Auctions as an Allocation Mechanism in Victoria, Australia.
W91-00080 6C

South Australian Water: A Disinfection Problem.
W91-00480 5F

Occurrence of Hypolimnetic Blooms of the Purple Sulfur Bacterium, Thiopedia rosea, and the Green Sulfur Bacterium, Chlorobium limicola, in an Australian Reservoir.
W91-00652 5C

Physicochemistry and Vegetation of Piccaninnie Ponds, a Coastal Aquifer-Fed Pond in Southeastern South Australia.
W91-00653 2H

Grazing on Bacteria by Zooplankton in Australian Billabongs.
W91-00654 2H

Lake Thetis, Western Australia: An Example of Saline Lake Sedimentation Dominated by Benthic Microbial Processes.
W91-00655 2H

Pilot Studies for Designs of Surveys of Human Disturbance of Intertidal Habitats in New South Wales.
W91-00685 4C

Waterbirds Dynamics at Bool Lagoon, South Australia, 1983-87.
W91-00686 2H

Lead Poisoning in Magpie Geese Anseranus semipalmata from Ingested Lead Pellet at Bool Lagoon Game Reserve (South Australia).
W91-00687 5C

Magpie Goose, Anseranus semipalmata, Nesting on the Mary River Floodplain, Northern Territory, Australia: Extent and Frequency of Flooding Losses.
W91-00688 2H

Sediment-Water Interaction as a Control on Geochemical Evolution of Playa Lake Systems in the Australian Arid Interior.
W91-00736 2H

Metal Concentrations in Surficial Sediments from Hypersaline Lakes, Australia.
W91-00737 2K

Salinity as a Determinant of Salt Lake Fauna: A Question of Scale.
W91-00757 2H

Absolute Dating of Sedimentation on Lake Torres with Spring Deposits, South Australia.
W91-00760 2H

Classification of the Macroinvertebrate Fauna of Two River Systems in Southwestern Australia in Relation to Physical and Chemical Parameters.
W91-00774 2H

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.
W91-00864 2G

Evaporation from Dampland Vegetation on a Groundwater Mound.
W91-00879 2D

Groundwater Response to Reforestation in the Darling Range of Western Australia.
W91-00892 2F

AUTOANALYZERS
Automated Determination of Silica in Surface and Ground Water (Die Outomatiese Bepaling van Silika in Oppervlak en Grondwater).
W91-00638 7B

AUTOMATION
Computer-Operated Treatment Plant Provides Top Quality Water.
W91-00106 5F

Automated Preconcentration of Trace Metals from Seawater and Freshwater.
W91-00615 7B

AVALANCHES
Sediment Yield and Discharge in Mountainous Small River Basins: Actual Condition of Sediment Discharge After Damage Caused by Sand and Stone Avalanches (in Japanese).
W91-00766 2J

BACTERIA
Short-Term Productivity Responses of Algae and Bacteria to Zooplankton Grazing in Two Freshwater Lakes.
W91-00418 2H

Acute Toxicity, Sublethal Effects, and Bioconcentration of Chlorination Products, Viruses, and Bacteria in Edible Shellfish: A Review.
W91-00515 5C

Factors that Change Bacterial Resistance to Disinfection.
W91-00544 5F

Disinfection of Bacterial Biofilms.
W91-00545 5F

BACTERIA

Occurrence of Hypolimnetic Blooms of the Purple Sulfur Bacterium, Thiopedia rosea, and the Green Sulfur Bacterium, Chlorobium limicola, in an Australian Reservoir.
W91-00652 5C

Grazing on Bacteria by Zooplankton in Australian Billabongs.
W91-00654 2H

Bacterial Regeneration of Ammonium and Phosphate as Affected by the Carbon:Nitrogen:Phosphorus Ratio of Organic Substrates.
W91-00732 5B

Long-term Survival of and Plasmid Stability in Pseudomonas and Klebsiella Species and the Appearance of Nonculturable Cells in Agricultural Drainage Water.
W91-00733 5B

Toxicity of 1,1,1-Trichloroethane and Trichloroethene on a Mixed Culture of Methane-Oxidizing Bacteria.
W91-00832 5G

Tetrachloroethene Transformation to Trichloroethene and cis-1,2-Dichloroethene by Sulfate-Reducing Enrichment Cultures.
W91-00833 5B

BACTERIAL ANALYSIS
Summertime Sampling.
W91-00111 5A

Bacterial Pollution of the River Tigris.
W91-00392 5B

Quantitative Microbiological Analysis of Bacterial Community Shifts in a High-Rate Anaerobic Bioreactor Treating Sulfite Evaporator Condensate.
W91-00829 5D

Detection and Analysis of Two Serotypes of Ammonia-Oxidizing Bacteria in Sewage Plants by Flow Cytometry.
W91-00831 5D

BACTERIAL PHYSIOLOGY
Factors that Change Bacterial Resistance to Disinfection.
W91-00544 5F

Resistance to Antibiotics and Heavy Metals of Pseudomonas aeruginosa Isolated from Natural Waters.
W91-00698 5C

Iron-Binding Compounds and Related Outer Membrane Proteins in Vibrio cholerae Non-O1 Strains from Aquatic Environments.
W91-00830 5B

Bacteria Degrading Phenolic Acids Isolated on a Polymeric Phenolic Pigment.
W91-00873 5D

BACTERIOPHAGE
F-specific RNA Bacteriophages and Sensitive Host Strains in Faeces and Wastewater of Human and Animal Origin.
W91-00872 5A

BALTIC SEA
Effect of H2S on Heterotrophic Substrate Uptake, Extracellular Enzyme Activity and Growth of Brackish Water Bacteria.
W91-00730 2L

BANK EROSION
Channel and Bank Stability of Osborne Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00437 2J

Channel and Bank Stability of Twentymile Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00439 2J

BARCELONA
Analysis of Instantaneous Rainfall Rate during Flash Floods in Barcelona.
W91-00189 2B

BARNACLES
Field Evaluation of the Effect of Chlorinated Treated Sewage on Settlement of Oysters (Crassostrea virginica Gmelin) and Barnacles (Balanus sp).
W91-00511 5C

BARYCZ RIVER
Water Quality in the Barycz River and Its Tributaries Within the Area of the Low Silesian Commercial Fishery Farm in Milicz (Jakosc Wody Rzeki Baryczy i Jej Doplywow na Obsazarze Dolnoslaskiego Kombinatu Rybackiego).
W91-00734 5B

BASALTS
Brisk Ground Water Investigation for Locating Bore Hole Site is Basaltic Terrain.
W91-00249 2F

BASE FLOW
Evaluation of Automated Techniques for Base Flow and Recession Analyses.
W91-00593 2E

BASOTU LAKES
Evolution of Saline Lake Waters: Gradual and Rapid Biogeochemical Pathways in the Basotu Lake District, Tanzania.
W91-00739 2H

BEACH CONTAMINATION
Beach Tar Contamination in Jamaica.
W91-00702 5B

BED LOAD
Bed Form Resistances in Open Channel Flows.
W91-00063 8B

One-Dimensional Model for the Transport of a Sediment Mixture in Non-Equilibrium Conditions.
W91-00070 2J

Conversion of Braided Gravel-Bed Rivers to Single-Thread Channels of Equivalent Transport Capacity.
W91-00078 2J

Reconstruction of the Recent Flow History of a Braided Gravel River.
W91-00079 2E

Temporal Lag Effect in Bed Load Sediment Transport.
W91-00093 2J

Prediction of Entrainment Conditions for Nonuniform, Noncohesive Sediments.
W91-00094 2J

2-D Bed Evolution in Natural Watercourses: New Simulation Approach.
W91-00177 2J

BELGIUM
Simulation of Land Use Changes and Impacts on the Water Balance: A Case Study for Belgium.
W91-00162 4C

BENTHIC ENVIRONMENT
Seasonal Variability in the Sensitivity of Freshwater Lentic Communities to a Chronic Copper Stress.
W91-00196 5C

BENTHIC FAUNA
Benthic Macrofauna and Ancillary Data for San Francisco Bay, California, January to November 1988.
W91-00343 2L

Relationships Between Acidity and Benthic Invertebrates of Low-Order Woodland Streams in the Adirondack Mountains, New York.
W91-00657 5C

Distribution and Abundance of Littoral Benthic Fauna in Canadian Prairie Saline Lakes.
W91-00751 2H

Enhancement of Benthic Macroinvertebrates by Minimum Flow from a Hydroelectric Dam.
W91-00778 6G

Marginal Zoobenthos of a Southern Brazilian Dam (Zoobenthos Litoraneos de um Acude Sul-Brasileiro).
W91-00780 6G

BENTHOS
Ecological Studies on the Plankton and Benthos of Wadi Elrayan, a New Lake in Egypt.
W91-00679 2H

BERYLLIUM
Sediment Storage and Movement on the Southern High Plains of Texas as Indicated by Beryllium-Ten.
W91-00299 2J

BILLABONGS
Grazing on Bacteria by Zooplankton in Australian Billabongs.
W91-00654 2H

BIOACCUMULATION
Bioaccumulation of Kepone by Grass Shrimp (Palaemonetes pugio): Importance of Dietary Accumulation and Food Ration.
W91-00201 5B

Bioaccumulation of Mercury and Its Effect on Protein Metabolism of the Water Hyacinth Weevil Neochetina eichhornae (Warner).
W91-00212 5C

Model of Organic Chemical Uptake and Clearance by Fish from Food and Water.
W91-00622 5B

Using Seabirds to Monitor Mercury in Marine Environments: The Validity of Conversion Ratios for Tissue Comparisons.
W91-00704 5B

Determination of the Environmental Capacity of Haifa Bay with Respect to the Input of Mercury.
W91-00706 5B

Incidence of Vibrio parahaemolyticus in U.S. Coastal Waters and Oysters.
W91-00825 5B

Tolerance of Scapania undulata (L.)Dum. to Fluoride.
W91-00835 5C

BIOASSAY
In Vitro Inhibition of Acetylcholinesterase from Four Marine Species by Organophosphates and Carbamates.
W91-00206 5A

Chlorine Sensitivity of Early Life Stages of Freshwater Fish.
W91-00514 5C

Rapid Method for Assessing Growth Rates of Coral in Relation to Water Pollution.
W91-00705 5A

Comparative Study of Toxic Lead Effect on Gill and Hemoglobin of Tilapia Fish.
W91-00722 5A

Simple Continuous-Flow Toxicity Test System for Microscopic Life Stages of Aquatic Organisms.
W91-00814 5A

BIOCHEMICAL OXYGEN DEMAND
Microbial Sensor for BOD.
W91-00812 5A

BIOCHEMISTRY
Biochemical Mechanisms of In Vitro Chloropropanone Toxicity.
W91-00502 5C

Evolution of Saline Lake Waters: Gradual and Rapid Biogeochemical Pathways in the Basotu Lake District, Tanzania.
W91-00739 2H

Variability of Biogenic Sulfur Flux from a Temperate Salt Marsh on Short Time and Space Scales.
W91-00847 2L

BIOCIDES
Effects of Deltamethrin and Ethanol on Survival, and Mechanical Response of Daphnia spinulata.
W91-00208 5C

BIOCONTROL
Manipulating Lake Community Structure: Where Do We Go from Here.
W91-00428 2H

BIODEGRADATION
Effects of Drill Cuttings on a Model Marine Sediment System.
W91-00044 5C

Crude Oil and Hydrocarbon-degrading Strains of Rhodococcus rhodochrous Isolated from Soil and Marine Environments in Kuwait.
W91-00144 5B

Measurement of Biodegradable Organic Matter and Bacterial Growth Potential in Drinking Water.
W91-00381 5F

Biodegradation Kinetics of Substituted Phenolics: Demonstrations of a Protocol Based on Electrolytic Respirometry.
W91-00809 5B

Respiration Inhibition Kinetic Analysis.
W91-00810 5D

Activity and Adaptation of Nitrilotriacetate (NTA)-Degrading Bacteria: Field and Laboratory Studies.
W91-00811 5D

Degradation of Polyphenols in Five Plant Species in the Aquatic Environment (Degradacao de Ploifenois em Cinco Especies Vegetais em Ambientes Aquaticos).
W91-00821 2H

Dechlorination of Four Commercial Polychlorinated Biphenyl Mixtures (Aroclors) by Anaerobic Microorganisms from Sediments.
W91-00827 5B

Tetrachloroethene Transformation to Trichloroethene and cis-1,2-Dichloroethene by Sulfate-Reducing Enrichment Cultures.
W91-00833 5B

Bacteria Degrading Phenolic Acids Isolated on a Polymeric Phenolic Pigment.
W91-00873 5D

Biodegradation of Environmental Pollutants.
W91-00946 5D

BIOFILMS
Disinfecting Biofilms in a Model Distribution System.
W91-00382 5F

Disinfection of Bacterial Biofilms.
W91-00545 5F

BIOFOULING
Development and Calibration of a Model for Predicting Optimum Chlorination Scenarios for Biofouling Control.
W91-00516 5C

Measurement of Chlorine Residuals in Chlorinated Cooling Waters: Effect of Organic Nitrogen.
W91-00517 5B

Manganese Deposition in Chlorinated Power Plant Cooling Water.
W91-00518 5F

Microbiofouling on Plastic Packing in Cooling Towers: A Case for Chlorine Treatment.
W91-00519 5F

Targeted Chlorination Schedules and Effects on Heat Transfer.
W91-00520 5F

BIOGAS
Variability of Biogenic Sulfur Flux from a Temperate Salt Marsh on Short Time and Space Scales.
W91-00847 2L

BIOINDICATORS
Reproductive Strategy of Daphnia magna Affects the Sensitivity of Its Progeny in Acute Toxicity Tests.
W91-00192 5A

Seasonal Variability in the Sensitivity of Freshwater Lentic Communities to a Chronic Copper Stress.
W91-00196 5C

Behavioral Changes in Gammarus pulex and Its Significance in the Toxicity Assessment of Very Low Levels of Environmental Pollutants.
W91-00207 5C

Heavy Metal Contamination in the River Toad, Bufo juxtasper (Inger), Near a Copper Mine in East Malaysia.
W91-00209 5B

Detecting the Biological Effects of Deep-Sea Waste Disposal.
W91-00386 5A

Fish Hepatocyte Model for Investigation of the Effects of Trihalomethanes.
W91-00503 7B

Use of Extant Populations of Scaled Chrysophytes for the Inference of Lakewater pH.
W91-00658 5A

Limnological Studies of Four Polluted Ponds in and Around Dhaka City with Reference to Indicator Species.
W91-00672 5C

Arsenate Sensitivity in Marine Periphyton Communities Established Under Various Nutrient Regimes.
W91-00700 5C

Using Seabirds to Monitor Mercury in Marine Environments: The Validity of Conversion Ratios for Tissue Comparisons.
W91-00704 5B

Rapid Method for Assessing Growth Rates of Coral in Relation to Water Pollution.
W91-00705 5A

Biomonitoring of Chemicals on Tropical Ecosystems.
W91-00823 5B

F-specific RNA Bacteriophages and Sensitive Host Strains in Faeces and Wastewater of Human and Animal Origin.
W91-00872 5A

BIOLOGICAL MAGNIFICATION
Bioaccumulation of Kepone by Grass Shrimp (Palaemonetes pugio): Importance of Dietary Accumulation and Food Ration.
W91-00201 5B

Model of Organic Chemical Uptake and Clearance by Fish from Food and Water.
W91-00622 5B

BIOLOGICAL OXYGEN DEMAND
Carbon and Nitrogen Transformations in Wastewater During Treatment with Hydrocotyle umbellata L.
W91-00834 5D

BIOLOGICAL STUDIES
Fish Hepatocyte Model for Investigation of the Effects of Trihalomethanes.
W91-00503 7B

BIOLOGICAL TREATMENT
Microbiological and Chemical Investigations on a Biological, Autotrophic Denitrification Plant Using Hydrogen as an Energy Source.
W91-00024 5F

Aerobic Processes.
W91-00943 5D

Biodegradation of Environmental Pollutants.
W91-00946 5D

BIOLOGICAL WASTEWATER TREATMENT
Biological Treatment of Hazardous Wastes, Sludges and Wastewater.
W91-00404 5D

Improved Performance of Upflow Anaerobic Sludge Blanket (UASB) Reactors by Operating Alternatives.
W91-00416 5D

Lagoons, Leach Fields, and Other Assistants of Nature.
W91-00799 5D

Quantitative Microbiological Analysis of Bacterial Community Shifts in a High-Rate Anaerobic Bioreactor Treating Sulfite Evaporator Condensate.
W91-00829 5D

Effect of Withdrawal of Morpholine from the Influent and Its Reinstatement on the Performance and Microbial Ecology of a Model Activated Sludge Plant Treating a Morpholine-Containing Influent.
W91-00874 5D

Instability of the Morpholine-Degradative Phenotype in Mycobacteria Isolated from Activated Sludge.
W91-00875 5D

BIOMASS
Stream Canopy and Its Relationship to Salmonid Biomass in the Intermountain West.
W91-00013 8I

BIOMONITORING
Biomonitoring of Chemicals on Tropical Ecosystems.
W91-00823 5B

BIOPELLETS
Growth of Biopellets on Glucose in Upflow Anaerobic Sludge Bed (UASB) Systems.
W91-00631 5D

Effect of Nitrogen Limitation on Pelletisation in Upflow Anaerobic Sludge Bed Systems.
W91-00632 5D

Pelletisation in a UASB System with Protein (Casein) as Substrate.
W91-00633 5D

BIOREMEDIATION
Bioremediation Comes of Age.
W91-00400 5G

BIOTRANSFORMATION
Using Isotope Fractionation of Nitrate-Nitrogen and Nitrate-Oxygen for Evaluation of Microbial Denitrification in a Sandy Aquifer.
W91-00166 5B

BIOTURBATION
Porewater Mixing by Microorganisms, Monitored by a Radiotracer Method.
W91-00693 2J

BLACK SEA
Comparative Data on Primary Productivity and Mineral Phosphorus Uptake in the Euphotic Zone of the Mediterranean and Black Sea.
W91-00710 2L

Remarks on the Zooplankton Population Structure near Wastewater Outfalls on the Romanian Shore of the Black Sea (Remarques sur la Structuration des Populations Zooplanctoniques dans les Zones des Emissaires d'Eaux Usees du Littoral Roumain de la Mer Noire).
W91-00711 5C

Some Preliminary Data on the Nutrient Influx into the Western Black Sea.
W91-00712 5B

Distribution and Correlation of Elements in Waters, Suspensions, Sediments, and Marine Organisms from the Black Sea.
W91-00797 5A

BLOOD
Effect of Cadmium on Blood of Tilapia, Oreochromis mossambicus (Peters), During Prolonged Exposure.
W91-00214 5C

BOATING
Slips Ahoy.
W91-00677 8A

BOGS
Nutrient Status of Ombrotrophic Peat Bogs.
W91-00640 2H

Comparative Development of Bogs and Fens in Central Sweden: Evaluating the Role of Climate Change and Ecosystem Development.
W91-00641 2H

Vegetation and Paleoecology of a Bog Complex in S Finland.
W91-00642 2H

Preservation of Plant Polymers in Peat and Liberation of Their Monomers Due to Artificial Drainage.
W91-00643 2H

BOLIVIA
Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

BONDING
Spectroscopic Investigations of Peat-Water Interactions: An ESR, FT-IR, and NMR Study.
W91-00789 2H

BOOL LAGOON
Waterbirds Dynamics at Bool Lagoon, South Australia, 1983-87.
W91-00686 2H

Lead Poisoning in Magpie Geese Anseranus semipalmata from Ingested Lead Pellet at Bool Lagoon Game Reserve (South Australia).
W91-00687 5C

BORATES
Determination of Borate at Trace Levels in Environmental Samples by Ion-Exclusion Chromatography.
W91-00725 5A

BOREHOLE GEOPHYSICS
Evaluation of Hydrogeochemical Parameters with Spontaneous Potential Logs.
W91-00157 7B

Borehole Geophysical Logging Techniques for Delineating Fractured Zones and Cavities in Hard Rock Areas for Hydrofracturing: A Case Study.
W91-00241 2F

Moisture Variation Study by Neutron-Neutron Logging.
W91-00255 7C

Study of Soil Moisture Movement in the Vadose Zone Using Neutron Probe.
W91-00256 7B

Borehole Resistivity Logging in PVC Screened Well.
W91-00264 2F

Geophysically Determined Porosity of Paleozoic Rocks in the Upper Colorado River Basin.
W91-00314 2F

Application of Geophysical Methods to Hydrogeological Problems in Dinaric Karst of Yugoslavia.
W91-00326 7B

Analysis of Geophysical Well Logs and Flowmeter Measurements in Boreholes Penetrating Subhorizontal Fracture Zones, Lac Du Bonnet Batholith, Manitoba, Canada.
W91-00354 2F

BOREHOLES
Analysis of Pumping Test Data from Borewells in Fractured Rocks of Karnataka.
W91-00217 2F

Borehole Geophysical Logging Techniques for Delineating Fractured Zones and Cavities in Hard Rock Areas for Hydrofracturing: A Case Study.
W91-00241 2F

Deep Geoelectrical Soundings and Shapes of Curves Used for Recommendations of Bore Sites in Basaltic Terrain.
W91-00247 7B

Brisk Ground Water Investigation for Locating Bore Hole Site is Basaltic Terrain.
W91-00249 2F

Borehole Resistivity Logging in PVC Screened Well.
W91-00264 2F

BOTTOM SEDIMENTS
Numerical Model of Phosphorus Exchange Between the Sediments and the Near-Bottom Water in a Lake.
W91-00002 2H

Storm Runoff and its Effects on the Water Quality and Bottom-Material Quality of Cedar Creek, West-Central Illinois, 1985-6.
W91-00339 5B

Reconnaissance Investigation of Water Quality, Bottom Sediment, and Biota Associated with Irrigation Drainage in and near Stillwater Wildlife Management Area, Churchill County, Nevada, 1986-87.
W91-00351 5C

BOUNDARY ELEMENT METHOD
Three-Dimensional Boundary Element Reservoir Model for Seismic Analysis of Arch and Gravity Dams.
W91-00123 8D

BOWEN RATIO
Transpiration of Plantation Pinus radiata Estimated by the Heat Pulse Method and the Bowen Ratio.
W91-00867 2D

BRAIDED STREAMS
Conversion of Braided Gravel-Bed Rivers to Single-Thread Channels of Equivalent Transport Capacity.
W91-00078 2J

Reconstruction of the Recent Flow History of a Braided Gravel River.
W91-00079 2E

Constraints on Duration of Sediment Storage in a Wide, Gravel-Bed River, New Zealand.
W91-00298 2J

BRAZIL
Microphytoplankton of Upwelling Coastal Waters (State of Rio de Janeiro): List of Species and Ecological Aspects (O Microfitoplancton das Aguas Costeiras do Litoral Fluminense (Estado do Rio de Janeiro)): Lista de Especies e Aspectos Ecologicos.
W91-00689 2L

Seasonal Variation of Sirodotia delicatula Skuja (Rhodophyta, Batrachospermaceae) in a Small Stream From Sao Paulo State, Southeastern Brazil.
W91-00782 2H

Water Chemistry of the Solimoes/Amazon River (A Hidroquimica do Rio Solimoes/Amazonas).
W91-00820 2K

BRIDGE CONSTRUCTION
Flooding Controlled by Bridge Relocation.
W91-00105 4A

BRIDGE DESIGN
Bridges and Culverts Reduced in Size and Cost by Use of Critical Flow Transitions.
W91-00100 8B

Local Scour Around Bridge Piers.
W91-00397 2J

BRIDGES
Bridges and Culverts Reduced in Size and Cost by Use of Critical Flow Transitions.
W91-00100 8B

Local Scour Around Bridge Piers.
W91-00397 2J

BRINE DISPOSAL
Subsurface Transport of Inorganic and Organic Solutes from Experimental Road Spreading of Oil-Field Brine.
W91-00365 5B

BRINE SHRIMP
Artemia monica Cyst Production and Recruitment in Mono Lake, California, USA.
W91-00755 2H

BRINES
Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

BRITISH COLUMBIA
Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

Vernal Microstratification Patterns in a Meromictic Saline Lake: Their Causes and Biological Significance.
W91-00745 2H

Autumnal Mixing in Mahoney Lake, British Columbia.
W91-00747 2H

BRODERICK WOOD PRODUCTS
Superfund Record of Decision, Broderick Wood Products Company.
W91-00555 5G

BROMIDES
Trihalomethane Formation and Distribution in Bromide-Rich and Ammonia-Containing Lake Water.
W91-00526 5B

Chlorination of Surface Waters: Effects of Bromide Concentration on the Chloropicrin Formation Potential.
W91-00527 5B

Movement and Fate of Atrazine and Bromide in Central Kansas Croplands.
W91-00882 5B

BROMINATION
Chemistry of Bromine Transfer: Disproportionation and Hydrolysis in Bromamine Systems.
W91-00540 2K

BROMINE
Chemistry of Bromine Transfer: Disproportionation and Hydrolysis in Bromamine Systems.
W91-00540 2K

BROMINE CHLORIDE
Hydrolysis Constants of Chlorine Monoxide and Bromine Chloride in Water.
W91-00542 5B

BROOK TROUT
Response of a Brook Trout (Salvelinus fontinalis) Population to a Reduction in Stream Benthos Following an Insecticide Treatment.
W91-00660 5C

BUFFER CAPACITY
Longitudinal and Seasonal Water Chemistry Variations in a Northern Appalachian Stream.
W91-00089 2K

BULLHEAD
Populations, Growth, Biomass and Production of Fish in a Small Stream in North-West Poland.
W91-00007 2H

BUTYRATES
Growth of Biopellets on Glucose in Upflow Anaerobic Sludge Bed (UASB) Systems.
W91-00631 5D

Respiration Inhibition Kinetic Analysis.
W91-00810 5D

BYPASS CHANNELS
Improvement of Bypassing and Backpassing at Tidal Inlets.
W91-00178 8A

CADDISFLIES
Resource Limitation in a Stream Community: Phosphorus Enrichment Effects on Periphyton and Grazers.
W91-00618 2H

Relationships Between Copper Concentrations in Larvae of Plectrocnemia conspersa (Curtis) (Trichoptera) and in Mine Drainage Streams.
W91-00859 5B

CADMIUM
Reproductive Strategy of Daphnia magna Affects the Sensitivity of Its Progeny in Acute Toxicity Tests.
W91-00192 5A

Seasonal Changes in the Testes of Fish Puntius ticto, and Their Relation to Heavy Metal Toxicity.
W91-00211 5C

Effect of Cadmium on Blood of Tilapia, Oreochromis mossambicus (Peters), During Prolonged Exposure.
W91-00214 5C

CALCIUM
Reduction of Phosphorus and Chlorophyll a Concentrations Following CaCO3 and Ca(OH)2 Additions to Hypereutrophic Figure Eight Lake, Alberta, Canada.
W91-00625 5F

CALCIUM CARBONATE
Suggested Methods for Calculating and Interpreting Calcium Carbonate Saturation Indexes.
W91-00380 2K

CALIFORNIA
History of Registration of Geologists and Geophysicists in California.
W91-00277 6E

Estimates of Evapotranspiration in Alkaline Scrub and Meadow Communities of Owens Valley, California, Using the Bowen-Ratio, Eddy-Correlation, and Penman-Combination Methods.
W91-00333 2D

Comparison of Tracer-Dilution and Current-Meter Discharge Measurements in a Small Gravel-Bed Stream, Little Lost Man Creek, California.
W91-00337 2E

Benthic Macrofauna and Ancillary Data for San Francisco Bay, California, January to November 1988.
W91-00343 2L

Ecology of a Mediterranean-Climate Estuarine Wetland at Carpinteria, California: Plant Distributions and Soil Salinity in the Upper Marsh.
W91-00675 2L

Distribution and Abundance of the Alkali Fly (Ephydra hians) Say at Mono Lake, California (USA) in Relation to Physical Habitat.
W91-00752 2H

Artemia monica Cyst Production and Recruitment in Mono Lake, California, USA.
W91-00755 2H

Reclaimed Water Helps Fight Drought.
W91-00772 3C

Groundwater Recharge with Reclaimed Water in California.
W91-00800 4B

CANADA
Optimizing Polymer Dosage in Sludge Dewatering Process.
W91-00112 5D

Spring Break-Up in Northern Canada Past and Present.
W91-00116 2C

Evaluation of Phosphorus Loads from Ontario Municipal Wastewater Treatment Plants.
W91-00132 5D

Estimation of Phosphorus from the Niagara River to Lake Ontario.
W91-00133 5E

Inferred Effects of Lake Acidification on Daphnia galeata mendotae.
W91-00626 5C

Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

Distribution and Abundance of Littoral Benthic Fauna in Canadian Prairie Saline Lakes.
W91-00751 2H

Case Study of a Successful Facility Siting.
W91-00910 5E

CANAL DESIGN
Design of Stable Alluvial Channels.
W91-00154 2J

CANALS
Design of Settling Basins.
W91-00097 2J

Use of Single Well Dilution Technique for Seepage Measurements from Canals Using Radio-Active Tracer.
W91-00230 2F

CANCER
Review of Recent Epidemiological Studies Reporting Associations between Drinking Water Disinfection and Cancer.
W91-00505 5F

Case-Control Study of Colon Cancer and Volatile Organics in Wisconsin Municipal Groundwater Supplies.
W91-00506 5C

Case-Control Study of Multiple Cancer Sites and Water Chlorination in Iowa.
W91-00507 5C

Case-Control Study of Bladder Cancer in Massachusetts Among Populations Receiving Chlorinated and Chloraminated Drinking Water.
W91-00508 5C

Bladder Cancer, Tap Water Consumption, and Drinking Water Source.
W91-00509 5C

CANOPY
Stream Canopy and Its Relationship to Salmonid Biomass in the Intermountain West.
W91-00013 8I

Effects of the Dry Season on the Vegetation Canopy of some River Basins of West Africa as Deduced from NOAA-AVHRR Data.
W91-00410 2I

Estimates of Ion Sources in Deciduous and Coniferous Throughfall.
W91-00415 5B

CAPILLARITY
Capillarity Correction for Free Surface Flow Revisited.
W91-00614 4B

CAPILLARY WATER
Functional Relation for Capillary Suction vs. Moisture Content.
W91-00260 7C

CARBAMATE PESTICIDES
In Vitro Inhibition of Acetylcholinesterase from Four Marine Species by Organophosphates and Carbamates.
W91-00206 5A

CARBON
Aspects of Carbon Metabolism in the Recovery of Selenastrum capricornutum Populations Exposed to Cadmium.
W91-00191 5C

CARBONATES
Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

CARBONYLS
Field Investigations on the Snow Chemistry in Central and Southern California-II. Carbonyls and Carboxylic Acids.
W91-00843 5B

CARBOXYLIC ACID
Field Investigations on the Snow Chemistry in Central and Southern California-II. Carbonyls and Carboxylic Acids.
W91-00843 5B

CARCINOGENS
Carcinogenicity of Chlorinated Acetic Acids.
W91-00492 5C

CARP
Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: I. Characteristics and Evaluation of Feeding Conditions (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: I. Charakterystyka I Ocena Warunkow Pokarmowych).
W91-00783 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: II. Qualitative and Quantitative Analyses of Nutrition and Nutritional Selectivity (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: II. Jakosciowa I Ilosciowa Analiza Pokarmu Oraz Wybiorczosc Pokarmowa).
W91-00784 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: III. Attempt to Evaluate the Pressure on Plankton of the Introduced Fish Population (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: III. Proba Oceny Presji Introdukowanej Populacji Ryb Na Plankton).
W91-00785 8I

CARRYING CAPACITY
Estimating the Carrying Capacity of a Coastal Inlet for Mussel Culture.
W91-00666 2L

CASCADING WATER
Cascading Water: A Threat to Ground Water Quality.
W91-00053 5B

CASE STUDIES
Management and Conservation of Ground Water Resource Through Point Dilution Technique Using Radiotracer - Some Case Histories.
W91-00229 4B

Borehole Geophysical Logging Techniques for Delineating Fractured Zones and Cavities in Hard Rock Areas for Hydrofracturing: A Case Study.
W91-00241 2F

Prospecting Groundwater in Pushkar Lake Region Through Remote Sensing - A Case Study.
W91-00244 7B

Radial Vertical Electrical Soundings: A Case Study in Groundwater Exploration.
W91-00246 2F

CASEIN
Pelletisation in a UASB System with Protein (Casein) as Substrate.
W91-00633 5D

CATALYSIS
Catalytic Incineration.
W91-00942 5D

CATALYTIC INCINERATION
Catalytic Incineration.
W91-00942 5D

CATASTROPHE THEORY
Catastrophe Model for the Forced Hydraulic Jump.
W91-00373 8B

CATCHMENT AREAS
Evaluation of Automated Techniques for Base Flow and Recession Analyses.
W91-00593 2E

Seasonal, Hydrological, and Land Management Factors Controlling Dissolved Organic Carbon Concentrations in the Loch Fleet Catchments, Southwest Scotland.
W91-00862 2H

Physics-Based Approach to Stochastic Hydrology of First-Order Drainage Basins.
W91-00968 2E

Use of Kinematic Wave Method to Assess Effects of Urban Development on Flood Peak Changes.
W91-00971 4C

Conceptual Model Simulating the Hydrological Processes on a Drainage Basin in a Plain Area.
W91-00981 2E

CAVES
Speleological Phenomena of Dinaric Karst.
W91-00322 2F

CAVITATION
Air Entrainment by Spillway Aerators.
W91-00061 8B

Forced Aeration of High Velocity Flows.
W91-00396 8A

CEMENT KILNS
Cement Kilns.
W91-00933 5D

CENTRIFUGATION
High-Solids Centrifuges Turn Out to Be Surprise Dewatering Choice.
W91-00114 5D

Further Discussion on the Intercomparison of the Trace Metal Concentrations and Particle Size of Fluvial Sediment Recovered from Two Centrifuge Systems.
W91-00866 5A

CESIUM RADIOISOTOPES
Preliminary Assessment of the Potential for Using Cesium-137 to Estimate Rates of Soil Erosion in the Loess Plateau of China.
W91-00405 2J

CHANNEL EROSION
Stream-Channel Incision Following Drainage-Basin Urbanization.
W91-00082 4C

Influence of Sand or Gravel on the Erosion of Cohesive Sediment.
W91-00095 2J

Significance of Sediment Transport in Arroyo Development.
W91-00346 2J

Channel Changes at Cross Sections of the Powder River Between Moorhead and Broadus, Montana, 1975-88.
W91-00436 2J

CHANNEL FLOW
Velocity Distribution in Alluvial Channel Flow.
W91-00036 8B

Improved Method of Calculation for Steady Uniform Flow in Prismatic Main Channel/Flood Plain Sections.
W91-00038 8B

Prediction of Flow Characteristics in Main Channel/Flood Plain Flows.
W91-00073 8B

Physical Habitat Simulation and Sedimentation.
W91-00303 4C

Guide for Selecting Manning's Roughness Coefficients for Natural Channels and Flood Plains.
W91-00335 2E

Inviscid Dam-Break Solution.
W91-00376 8B

Steady Uniform Flow in Prismatic Channels with Flood Plains.
W91-00761 2E

CHANNEL MORPHOLOGY
Local Scour Profiles Downstream of Hydraulic Jump.
W91-00032 8B

Hydraulic Jumps at Positive and Negative Steps.
W91-00034 8B

Flow Resistance in Compound Channels.
W91-00037 2E

Classification of Unidirectional Three-layer Flow Over a Hump.
W91-00041 8B

Experimental Study of Complex Response in River Channel Adjustment Downstream from a Reservoir.
W91-00050 2J

Bed Form Resistances in Open Channel Flows.
W91-00063 8B

Conversion of Braided Gravel-Bed Rivers to Single-Thread Channels of Equivalent Transport Capacity.
W91-00078 2J

Reconstruction of the Recent Flow History of a Braided Gravel River.
W91-00079 2E

Stream-Channel Incision Following Drainage-Basin Urbanization.
W91-00082 4C

Menu of Coupled Velocity and Sediment-discharge Relations for Rivers.
W91-00149 2J

Stability Limits for Preissmann's Scheme.
W91-00150 2E

Design of Stable Alluvial Channels.
W91-00154 2J

2-D Bed Evolution in Natural Watercourses: New Simulation Approach.
W91-00177 2J

Guide for Selecting Manning's Roughness Coefficients for Natural Channels and Flood Plains.
W91-00335 2E

Significance of Sediment Transport in Arroyo Development.
W91-00346 2J

Coupled Simulation of Transient Bed Evolution in Alluvial Channels.
W91-00407 2J

Channel Changes at Cross Sections of the Powder River Between Moorhead and Broadus, Montana, 1975-88.
W91-00436 2J

Review of the Search for a Quantitative Link Between Hydrologic Response and Fluvial Geomorphology.
W91-00977 2E

CHANNEL SCOUR
Local Scour Profiles Downstream of Hydraulic Jump.
W91-00032 8B

CHANNEL STABILITY
Experimental Study of Complex Response in River Channel Adjustment Downstream from a Reservoir.
W91-00050 2J

Design of Stable Alluvial Channels.
W91-00154 2J

Channel Changes at Cross Sections of the Powder River Between Moorhead and Broadus, Montana, 1975-88.
W91-00436 2J

Channel and Bank Stability of Osborne Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00437 2J

Channel and Bank Stability of Twentymile Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00439 2J

CHANNEL STORAGE
Constraints on Duration of Sediment Storage in a Wide, Gravel-Bed River, New Zealand.
W91-00298 2J

CHANNELS
Prediction of Flow Characteristics in Main Channel/Flood Plain Flows.
W91-00073 8B

Discharge characteristics of Local Discontinuous Contractions, II.
W91-00762 8B

Perturbation Solution of the Flood-Routing Problem.
W91-00763 7C

CHAR
Cultivaton and Management of Landlocked Salmon and Charr in Lake Saimaa (Saimaan Jarvilohen ja Nierian Viljely ja Hoito).
W91-00018 8I

CHEJU ISLAND
Environmental Isotope-Aided Studies on Water Resources in the Region of Cheju Island.
W91-00224 2F

CHEMICAL ANALYSIS
Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

Selected Quality Assurance Data for Water Samples Collected by the U.S. Geological Survey, Idaho National Engineering Laboratory, Idaho, 1980 to 1988.
W91-00334 7B

Evaluation of Methods Used from 1965 Through 1982 to Determine Inorganic Constituents in Water Samples.
W91-00350 7B

Suggested Methods for Calculating and Interpreting Calcium Carbonate Saturation Indexes.
W91-00380 2K

Determination of Gold at Femtomolar Levels in Natural Waters by Flow Injection Inductively Coupled Plasma Quadrupole Mass Spectrometry.
W91-00388 2K

Determination of Chloroaniline Traces in Environmental Waters by Selective Extraction with Two Traps in Tandem and Liquid Chromatography.
W91-00389 5A

Automated High-Performance Liquid Chromatography for the Determination of Pesticides in Water Using Solid Phase Extraction.
W91-00390 5A

Performance Evaluation Materials for the Analysis of Volatile Organic Contaminants in Soil: A Preliminary Assessment.
W91-00393 5A

Water Chlorination: Chemistry, Environmental Impact and Health Effects. Volume 6.
W91-00476 5F

Current Status of Disinfectant Residual Measurement Methods for Free and Combined Chloride and Oxychlorine Species.
W91-00479 5A

Chemistry of Bromine Transfer: Disproportionation and Hydrolysis in Bromamine Systems.
W91-00540 2K

Comparative Analysis of Aluminum Biogeochemistry in a Northeastern and a Southeastern Forested Watershed.
W91-00590 2K

Automated Preconcentration of Trace Metals from Seawater and Freshwater.
W91-00615 7B

Automated Determination of Silica in Surface and Ground Water (Die Outomatiese Bepaling van Silika in Oppervlak en Grondwater).
W91-00638 7B

Sampling and Analysis of Hazardous Wastes.
W91-00958 5A

CHEMICAL COMPOSITION
Chemical Characterization of Acid Precipitation in Albany, New York.
W91-00850 5A

CHEMICAL INTERACTIONS
Effect of Fluoride Complexation on Aluminum Toxicity Towards Juvenile Atlantic Salmon (Salmo salar).
W91-00663 5C

CHEMICAL OXYGEN DEMAND
Effect of Nitrogen Limitation on Pelletisation in Upflow Anaerobic Sludge Bed Systems.
W91-00632 5D

Pelletisation in a UASB System with Protein (Casein) as Substrate.
W91-00633 5D

CHEMICAL PRECIPITATION
Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

Chemical Precipitation.
W91-00923 5D

CHEMICAL PROPERTIES
Longitudinal and Seasonal Water Chemistry Variations in a Northern Appalachian Stream.
W91-00089 2K

Influence of Salinity on the Concentration and Rate of Interchange of Dissolved Phosphate between Water and Sediment in Fuente Piedra Lagoon (S. Spain).
W91-00743 2L

CHEMICAL REACTIONS
Destruction of Hazardous Chemical Waste by Oxidation in Supercritical Water.
W91-00450 5D

Mutagenicity of the Nonvolatile Reaction Products of Aqueous Chlorination of L-Tryptophan.
W91-00491 5C

Organic Reactions of Chlorine Dioxide in Drinking Water-A Mutagenic Assessment.
W91-00494 5F

Trihalomethane Formation Potential and Organic Content: A New Analytical Approach.
W91-00524 5F

Further Studies of Hypochlorite Ion Pair Chemistry and Disinfection Efficiency.
W91-00531 5F

Chlorinated Organic By-products of the Reaction of N-Chloropiperidine with Stomach Fluid from Laboratory Animals.
W91-00538 5B

Chemistry of Bromine Transfer: Disproportionation and Hydrolysis in Bromamine Systems.
W91-00540 2K

Proposed Mechanism for the Reactions of Chlorine Dioxide with Aquatic Organic Materials.
W91-00541 5F

Hydrolysis Constants of Chlorine Monoxide and Bromine Chloride in Water.
W91-00542 5B

Ozonation of Alachlor: Effects and Suitability as a Treatment Technology.
W91-00543 5F

CHEMICAL RECOVERY
Use of a Gel-Forming Biopolymer Directly Dispensed into a Loop Fluidized Bed Reactor to Recover Dissolved Copper.
W91-00813 5D

CHEMICAL REDUCTION
Chemical Oxidation and Reduction.

COMPUTER MODELS
Laterally Averaged Hydrodynamics Model for Reservoir Predictions.
W91-00062 2H

Groundwater Modelling as a Tool for Water Management: Waimea Plains, Nelson.
W91-00075 2F

Development of a Software Package for Trend Detection in Temporal Series: Application to Water and Industrial Effluent Quality Data for the St. Lawrence River.
W91-00139 5B

Menu of Coupled Velocity and Sediment-discharge Relations for Rivers.
W91-00149 2J

Modelling Agricultural Runoff: Overview.
W91-00302 5B

Using a Geographic Information System to Develop a Ground-Water Flow Model.
W91-00316 2F

SOLINPUT: A Computer Code to Create and Modify Input Files for the Geochemical Program SOLMINEQ.88.
W91-00359 7C

Graphical Kernel System (GKS) Version of Computer Program MODPATH-PLOT for Displaying Path Lines Generated from the U.S. Geological Survey Three-Dimensional Ground-Water Flow Model.
W91-00361 7C

Modeling the Potential Effect of Additives on Enhancing the Solubility of Aromatic Solutes Contained in Gasoline.
W91-00369 5B

Users Manual for the SLUDGEMAN Model for the Groundwater Pathway in the Monofilling of Sewage Sludge.
W91-00575 5E

Microcomputer Analysis of Pipe Networks.
W91-00630 5F

Variability of Results From the Use of PHABSIM in Estimating Habitat Area.
W91-00775 7C

Influence of the Angle of Incidence of the Rainfall on the Overland Flow Process.
W91-00969 2J

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

COMPUTER PROGRAMS
Development of a Water and Wastewater SCADA System.
W91-00101 5F

Computer-Operated Treatment Plant Provides Top Quality Water.
W91-00106 5F

Statistics-Based System for Treatment Plant Operation.
W91-00129 5D

Development of a Software Package for Trend Detection in Temporal Series: Application to Water and Industrial Effluent Quality Data for the St. Lawrence River.
W91-00139 5B

Pumping Test in a Low Permeability Claystone Aquifer Executed with High-Resolution Electronic Water Level Recorders and Evaluated with the Versatile Computer Program HYDROPAR.
W91-00216 2F

Computer Simulation of an Injected Tracer Movement.
W91-00262 2F

Statistical Processor for Analyzing Simulations Made Using the Modular Finite-Difference Ground-Water Flow Model.
W91-00353 7C

SOLINPUT: A Computer Code to Create and Modify Input Files for the Geochemical Program SOLMINEQ.88.
W91-00359 7C

Graphical Kernel System (GKS) Version of Computer Program MODPATH-PLOT for Displaying Path Lines Generated from the U.S. Geological Survey Three-Dimensional Ground-Water Flow Model.
W91-00361 7C

Spatial Allocation Factor Procedures for the 1980 NAPAP (National Acid Precipitation Assessment Program) Emissions Inventory Documentation.
W91-00453 5B

Enhancement of the HWRIC Database, Year 2. With an Evaluation of Database Content.
W91-00571 7C

Variability of Results From the Use of PHABSIM in Estimating Habitat Area.
W91-00775 7C

COMPUTERS
Techniques of Aquifer Parameter Evaluation Using Pocket Computers.
W91-00265 2F

CONDUCTIVITY
Some Characteristics of Springs in High Elevation Alteritic Material: Their Contribution to the Understanding of the Intricacy of the Two-Layered 'Sand-Basement' Aquifer (Madagascar High Plateaux) (Caracteristiques d'Emergences en Milieu Alteritique d'Altitude: Leur Apport a la Comprehension de l'Aquifere Bicouche Arenes-socle (Hauts Plateaux de Madagascar)).
W91-00856 2F

Release of Heavy Metals from Snowpacks on the Japan Sea Side of Japan.
W91-00858 5B

CONIFEROUS FORESTS
Chemical Studies of Chloride and Stable Oxygen Isotopes in Two Conifer Afforested and Moorland Sites in the British Uplands.
W91-00890 2D

CONIFERS
Estimates of Ion Sources in Deciduous and Coniferous Throughfall.
W91-00415 5B

CONJUNCTIVE USE
Conjunctive Use for Irrigation Development in Alluvial Regions: Problems, Prospects and Research Issues.
W91-00261 3F

CONNECTICUT
Comparison of Vesicular-Arbuscular Mycorrhizae in Plants from Disturbed and Adjacent Undisturbed Regions of a Coastal Salt Marsh in Clinton, Connecticut, USA.
W91-00029 2I

Use of Extant Populations of Scaled Chrysophytes for the Inference of Lakewater pH.
W91-00658 5A

CONSTRUCTION COSTS
Effect of System Layout on Subsurface Drainage Cost in Flat Irrigated Land.
W91-00081 4B

CONSTRUCTION MATERIALS
Stainless Steel in Wastewater Treatment Plants.
W91-00628 5D

Reducing Maintenance in a Water Treatment Plant.
W91-00629 5F

CONSUMPTIVE USE
Estimated Runoff from Man-Made Snow.
W91-00092 2C

CONVECTION
Theory of Subsurface Water-Borne Solute Transport.
W91-00119 5B

Cumulus Convection and Terrestrial Water-Vapor Distribution.
W91-00578 2B

CONVECTIVE PRECIPITATION
Analysis of Instantaneous Rainfall Rate during Flash Floods in Barcelona.
W91-00189 2B

CONVEYANCE STRUCTURES
Comprehensive Generalized Study of Scour at Cantilevered Pipe Outlets.
W91-00072 8B

COOLING TOWERS
Microbiofouling on Plastic Packing in Cooling Towers: A Case for Chlorine Treatment.
W91-00519 5F

COPEPODS
Distribution of Micro-Arthropods in Some Southern English Streams: The Influence of Physicochemistry.
W91-00419 2H

Potential for Adaptation of the Estuarine Copepod Eurytemora affinis to Chlorine-Produced Oxidant Residuals, High Temperature, and Low Oxygen.
W91-00512 5C

Ecology of Cyclopoid Copepods (Copepoda: Crustacea) in a Tropical Backwater Pond.
W91-00682 2H

COPPER
Time Series Analysis of Unequally Spaced Observations-With Applications to Copper Contamination of the River Gaula in Central Norway.
W91-00128 5B

Seasonal Variability in the Sensitivity of Freshwater Lentic Communities to a Chronic Copper Stress.
W91-00196 5C

Modeling the Effect of Algal Biomass on Multispecies Aquatic Microcosms Response to Copper Toxicity.
W91-00197 5C

Effects of Copper (II) on the Production of Trihalomethanes in Model and Natural Waters.
W91-00529 5B

Use of a Gel-Forming Biopolymer Directly Dispensed into a Loop Fluidized Bed Reactor to Recover Dissolved Copper.
W91-00813 5D

Relationships Between Copper Concentrations in Larvae of Plectrocnemia conspersa (Curtis) (Trichoptera) and in Mine Drainage Streams.
W91-00859 5B

CORALS
Rapid Method for Assessing Growth Rates of Coral in Relation to Water Pollution.
W91-00705 5A

CORRELATION ANALYSIS
Depletion and Recharge of Soil Water in Two Stands of Norway Spruce (Picea abies (L.) Karst).
W91-00860 2G

CORROSION
Corrosion and Water Quality.
W91-00411 5B

Case Histories of Sulfide Corrosion: Problems and Treatments.
W91-00768 8G

CORROSION CONTROL
Stainless Steel in Wastewater Treatment Plants.
W91-00628 5D

Reducing Maintenance in a Water Treatment Plant.
W91-00629 5F

COST ALLOCATION
Cost Perspectives for Hazardous-Waste Management.
W91-00960 5E

COST ANALYSIS
Effect of System Layout on Subsurface Drainage Cost in Flat Irrigated Land.
W91-00081 4B

Cost Savings Through Chemical Addition Sequencing.
W91-00102 5F

Hydrologic Parameter Effects on Small-Dam Risk Analysis in Missouri.
W91-00167 8A

Cost Impacts of Sediments in South African Rivers.
W91-00295 2J

Cost Effectiveness of the Streamflow-Gaging Program in West Virginia.
W91-00331 2E

Simulating Physical Processes and Economic Behavior in Saline, Irrigated Agriculture: Model Development.
W91-00585 3C

COST-BENEFIT ANALYSIS
Benefits of an Irrigation Water Rental Market in a Saline Stream-Aquifer System.
W91-00586 3F

Safety Goals for High-Hazard Dams: Are Dams Too Safe.
W91-00587 8A

COSTA RICA
Distribution and Transport of Sediment-Bound Metal Contaminants in the Rio Grande de Tarcoles, Costa Rica (Central America).
W91-00804 5A

COSTS
Cost and Performance of Membranes for Organic Control in Small Systems: Flagler Beach and Punta Gorda, Florida.
W91-00448 5F

CRESOL
Adsorption Removal of Cresol by Granular Activated Carbon for Medical Waste Water Treatment.
W91-00203 5D

CRUSTACEANS
Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Ecology of Cyclopoid Copepods (Copepoda: Crustacea) in a Tropical Backwater Pond.
W91-00682 2H

Biology and Ecology of Brachyuran Decapod Crustaceans in the Bay/Estuary System of Santos and Sao Vincente (Sao Paulo): 1. Occurrence and Species Composition (Bioecologia de Crustaceos Decapodos, Braquiuros, No Sistema Baia-Estuario de Santos e Sao Vincente, SP: 1. Ocorrencia e Composicao).
W91-00690 2L

Distribution Patterns of Ostracods in Iberian Saline Lakes. Influence of Ecological Factors.
W91-00753 2H

Anostraca, Cladocera and Copepoda of Spanish Saline Lakes.
W91-00754 2H

Artemia monica Cyst Production and Recruitment in Mono Lake, California, USA.
W91-00755 2H

Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

CRYSTALLINE ROCKS
Critical Evaluation of Pumping Test Data from Fractured Crystalline Formation.
W91-00219 2F

CULTURING TECHNIQUES
Bacterial Regeneration of Ammonium and Phosphate as Affected by the Carbon:Nitrogen:Phosphorus Ratio of Organic Substrates.
W91-00732 5B

Sequential Inoculation as an Adjunct in Enteric Virus Plaque Enumeration.
W91-00815 5A

Microbiological Investigations into an Outbreak of Pontiac Fever Due to Legionella micdadei Associated with Use of a Whirlpool.
W91-00840 5A

CULVERTS
Evaluation of Trout Passage Through Six Highway Culverts in Montana.
W91-00012 8I

Bridges and Culverts Reduced in Size and Cost by Use of Critical Flow Transitions.
W91-00100 8B

CURRENT METERS
Comparison of Tracer-Dilution and Current-Meter Discharge Measurements in a Small Gravel-Bed Stream, Little Lost Man Creek, California.
W91-00337 2E

CYANOBACTERIA
Cyanobacteria in Fish Ponds.
W91-00665 2H

CYANOPHTYA
Cyanobacteria in Fish Ponds.
W91-00665 2H

CYANOPHYTA
Microcystin Composition of an Axenic Clonal Strain of Microcystis viridis and Microcystis viridis-Containing Waterblooms in Japanese Freshwaters.
W91-00699 5C

Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

N-Carboxymethylchitosan: Algistatic and Algicidal Properties.
W91-00837 5F

CYCLING NUTRIENTS
Numerical Model of Phosphorus Exchange Between the Sediments and the Near-Bottom Water in a Lake.
W91-00002 2H

Simulation Model of Phosphorus Cycling in the Epilimnion of a Eutrophic Lake.
W91-00003 2H

Methods for Improving the Efficiency of Calibration of a Model of Phosphorus Cycling in a Lake Ecosystem.
W91-00004 2H

Nutrient Status of Ombrotrophic Peat Bogs.
W91-00640 2H

Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

Seasonal Variation in the Structure of the Microbial Community Capable of Nitrate Respiration in an Intertidal Mud Flat Sediment from the Elbe Estuary.
W91-00650 2L

Potential Bio-available Phosphorus in Sediments of the River Elbe in Northern Germany.
W91-00651 2L

Nitrogenous Nutrient Transformations in the Spring and Fall in the Chesapeake Bay.
W91-00718 2L

Natural Isotopic Composition of Dissolved Organic Nitrogen in the Chesapeake Bay.
W91-00719 2L

Bacterial Regeneration of Ammonium and Phosphate as Affected by the Carbon:Nitrogen:Phosphorus Ratio of Organic Substrates.
W91-00732 5B

Influence of Salinity on the Concentration and Rate of Interchange of Dissolved Phosphate between Water and Sediment in Fuente Piedra Lagoon (S. Spain).
W91-00743 2L

Control of Phytoplankton Growth in Nutrient Recycling Ecosystems. Theory and Terminology.
W91-00765 2H

Water Masses and Eutrophication in a Greek Anoxic Marine Bay.
W91-00798 5B

CYTOCHROMES
Induced Cytochrome P-450 in Intestine and Liver of Spot (Leiostomus xanthurus) from a Polycyclic Aromatic Hydrocarbon Contaminated Environment.
W91-00198 5C

CYTOLOGY
Arsenic-induced Ultrastructural Changes in the Vegetative Cells of Cystoseira barbata forma repens Zinova et Kalugina (Fucophyceae, Fucales).
W91-00202 5C

DAM DESIGN
Forced Aeration of High Velocity Flows.
W91-00396 8A

DAM EFFECTS
Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

Effects of a Fixed-Crest Weir on Brown Shrimp Penaeus aztecus Growth, Mortality, and Emigration in a Louisiana Coastal Marsh.
W91-00010 8I

Experimental Study of Complex Response in River Channel Adjustment Downstream from a Reservoir.
W91-00050 2J

Water Resources Data Collected During Water Year 1988 at Selected James River Basin Sites in North Dakota and South Dakota.
W91-00342 6G

Channel Changes at Cross Sections of the Powder River Between Moorhead and Broadus, Montana, 1975-88.
W91-00436 2J

Effect of Toston Dam on Upstream Ice Conditions.
W91-00574 6G

Effect of Regulation on 0+ Fish Recruitment in the Great Ouse, A Lowland River.
W91-00777 6G

Marginal Zoobenthos of a Southern Brazilian Dam (Zoobenthos Litoraneos de um Acude Sul-Brasileiro).
W91-00780 6G

Non-Linear System to Describe Movements of Water Masses at the LG-2 Reservoir (La Grande, Quebec).
W91-00885 2H

DAM FAILURE
Dimensionless Analytical Solutions for Dam-Breach Erosion.
W91-00069 8A

Hydrologic Parameter Effects on Small-Dam Risk Analysis in Missouri.
W91-00167 8A

Risk of Debris-basin Failure.
W91-00181 8A

Inviscid Dam-Break Solution.
W91-00376 8B

Simulation of One-Dimensional Dam-Break Flows.
W91-00399 8A

Safety Goals for High-Hazard Dams: Are Dams Too Safe.
W91-00587 8A

DAM INSPECTION
Hydrologic Parameter Effects on Small-Dam Risk Analysis in Missouri.
W91-00167 8A

DAM SAFETY
Hydrologic Parameter Effects on Small-Dam Risk Analysis in Missouri.
W91-00167 8A

Safety Goals for High-Hazard Dams: Are Dams Too Safe.
W91-00587 8A

DAM STABILITY
Hydrologic Parameter Effects on Small-Dam Risk Analysis in Missouri.
W91-00167 8A

Safety Goals for High-Hazard Dams: Are Dams Too Safe.
W91-00587 8A

DAMS
Three-Dimensional Analysis of Pressures on Dams.
W91-00057 8B

Nonlinear Hydrodynamic Pressure on Dams.
W91-00058 8B

Dimensionless Analytical Solutions for Dam-Breach Erosion.
W91-00069 8A

Forced Aeration of High Velocity Flows.
W91-00396 8A

Simulation of One-Dimensional Dam-Break Flows.
W91-00399 8A

Safety Goals for High-Hazard Dams: Are Dams Too Safe.
W91-00587 8A

DANUBE RIVER
Decision-Making Process on the Danube and the Platte.
W91-00088 6B

Some Preliminary Data on the Nutrient Influx into the Western Black Sea.
W91-00712 5B

DAPHNIA
Reproductive Strategy of Daphnia magna Affects the Sensitivity of Its Progeny in Acute Toxicity Tests.
W91-00192 5A

Effects of Deltamethrin and Ethanol on Survival, and Mechanical Response of Daphnia spinulata.
W91-00208 5C

Inferred Effects of Lake Acidification on Daphnia galeata mendotae.
W91-00626 5C

Cyclomorphosis in Daphnia: An Adaptation to Avoid Invertebrate Predation.
W91-00696 2H

Effects of Nickel on Daphnia Magna During Chronic Exposure and Alterations in the Toxicity to Generations Pre-Exposed to Nickel.
W91-00808 5C

DATA ACQUISITION
Measurement of Raindrop Size Distributions Using a Small Doppler Radar.
W91-00056 2B

Differential Reflectivity Radar Hail Measurement Technique: Observations During the Denver Hailstorm of 13 June 1984.
W91-00140 2C

Instrumentation and Technique of Groundwater Exploration (With Nature of Aquifer) in Unconsolidated Sediments (Gangetic Plains) of Uttar Pradesh, Northern India.
W91-00235 2F

More Accurate Determination of Aquifer Parameters Using the IP Sounding Method.
W91-00238 7B

Deciphering Groundwater Using Remote Sensing Techniques.
W91-00243 7B

Prospecting Groundwater in Pushkar Lake Region Through Remote Sensing - A Case Study.
W91-00244 7B

Deep Geoelectrical Soundings and Shapes of Curves Used for Recommendations of Bore Sites in Basaltic Terrain.
W91-00247 7B

Electrical Resistivity Survey for Ground Water in Varaha River Basin, A.P., India.
W91-00251 2F

Remote Sensing Based Appropriate Methodology for the Groundwater Exploration: A Case Study from Pre-Cambrians of South India.
W91-00254 7C

Moisture Variation Study by Neutron-Neutron Logging.
W91-00255 7C

Study of Soil Moisture Movement in the Vadose Zone Using Neutron Probe.
W91-00256 7B

Soil Moisture Studies in Soils of Delhi Territory Using the Resistivity Meter.
W91-00258 2G

Borehole Resistivity Logging in PVC Screened Well.
W91-00264 2F

Case Study of Approaches for Determining Diffuse Suspended Sediment Sources and Processes.
W91-00290 2J

Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

Application of Geophysical Methods to Hydrogeological Problems in Dinaric Karst of Yugoslavia.
W91-00326 7B

Some Methods of Hydrogeologic Exploration and Water Regulation in the Dinaric Karst with Special Reference to Their Application in Eastern Herzegovina.
W91-00327 2F

Cost Effectiveness of the Streamflow-Gaging Program in West Virginia.
W91-00331 2E

Remote Data Collection and Control for Hydrogeologic Monitoring.
W91-00370 7B

Satellite Teletransmission: Technology Applied to Hydrological Forecasting. An Example of the Fight against Onchocercosis (La Teletransmission par Satellite: Une Technologie Adaptee a la Prevision Hydrologique. Exemple de la Lutte contre l'Onchocerose).
W91-00475 7B

Current Status of Disinfectant Residual Measurement Methods for Free and Combined Chloride and Oxychlorine Species.
W91-00479 5A

Enhancement of the HWRIC Database, Year 2. With an Evaluation of Database Content.
W91-00571 7C

MECA Workshop on Atmospheric H2O Observations of Earth and Mars.
W91-00576 7B

Observations of Atmospheric Water Vapor with the SAGE II Instrument.
W91-00579 7B

Measurements of H2O in the Terrestrial Mesosphere and Implications for Extra-Terrestrial Sources.
W91-00580 2B

NIMBUS 7 LIMS Water Vapor Measurements.
W91-00581 2B

SPOT and Environmental Studies: An Advanced System to Collect Up to Date Geographic Information.
W91-00793 7B

Radiometric Studies of Clear Air Attenuation and Atmospheric Water Vapor at 22.235 GHz over Calcutta (Lat. 22 degrees 32 minutes N, Long. 88 degrees 20 minutes E).
W91-00852 2B

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

Further Discussion on the Intercomparison of the Trace Metal Concentrations and Particle Size of Fluvial Sediment Recovered from Two Centrifuge Systems.
W91-00866 5A

Transpiration of Plantation Pinus radiata Estimated by the Heat Pulse Method and the Bowen Ratio.
W91-00867 2D

DATA COLLECTIONS

Development of a Water and Wastewater SCADA System.
W91-00101 5F

Rural Water Supply Investigations in Scarcity Villages in Bhandara District, Maharashtra.
W91-00222 7B

Hydrogeologic and Water-Quality Data from Well Clusters Near the Wastewater-Treatment Plant, U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-00438 5B

Sources of Water-Use Information in Maine.
W91-00443 6D

Pesticides in Ground Water Data Base: 1988 Interim Report.
W91-00569 5B

DATA INTERPRETATION

Fourier and Moment Methods Applied to Two-Dimensional Raindrop Images.
W91-00055 2B

Robust Graphical Methods for Diagnosing Trend in Irregularly Spaced Water Quality Time Series.
W91-00138 5B

Some Fundamental Weak Spots of Kriging Technique and Their Consequences.
W91-00159 7C

Pumping Test in a Low Permeability Claystone Aquifer Executed with High-Resolution Electronic Water Level Recorders and Evaluated with the Versatile Computer Program HYDROPAR.
W91-00216 2F

Analysis of Pumping Test Data from Borewells in Fractured Rocks of Karnataka.
W91-00217 2F

Analysis of Test Pumping Data from Unconfined Aquifers by Simulation.
W91-00218 2F

Critical Evaluation of Pumping Test Data from Fractured Crystalline Formation.
W91-00219 2F

Joint System Analysis for the Evaluation of Flow in Fractured Aquifer.
W91-00228 7C

Parameter Estimation for a Quasi-Three-Dimensional Flow Model.
W91-00236 7C

Investigations of Groundwater Resources at Selected Levels in Droughtprone Area of Pahari Block, District Mirzapur, U.P., India.
W91-00237 2F

Prospecting Groundwater in Pushkar Lake Region Through Remote Sensing - A Case Study.
W91-00244 7B

Kriged Estimates of Water-Levels from the Sparse Measurements in a Hard Rock Aquifer.
W91-00245 2F

Fracture Pattern Modelling for Groundwater Targetting in Hard Rock Terrain: A Study Aided by Remote Sensing Technique.
W91-00250 7C

Digital Enhancement of Surface Geologic Features in a Part of Banas River Catchment for Ground Water Potential Characterization.
W91-00252 7C

Remote Sensing Based Appropriate Methodology for the Groundwater Exploration: A Case Study from Pre-Cambrians of South India.
W91-00254 7C

Moisture Variation Study by Neutron-Neutron Logging.
W91-00255 7C

Computer Simulation of an Injected Tracer Movement.
W91-00262 2F

Techniques of Aquifer Parameter Evaluation Using Pocket Computers.
W91-00265 2F

Hysteresis and Nonlinearity of Discharge-Sediment Relationships in the Atchafalaya and Lower Mississippi Rivers.
W91-00292 2J

Developing Accurate and Reliable Sediment Yields.
W91-00301 7C

Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Fuzzy Regression in Hydrology.
W91-00596 7C

Regional Water Quality: Evaluation of Data for Assessing Conditions and Trends.
W91-00619 7A

Source-Receptor Relationships for Wet SO4(2-) and NO3(-) Production.
W91-00851 5B

Effects of Recharge Systems on Hydrological Information Transfer Along Rivers.
W91-00984 2E

DATA QUALITY CONTROL

Selected Quality Assurance Data for Water Samples Collected by the U.S. Geological Survey, Idaho National Engineering Laboratory, Idaho, 1980 to 1988.
W91-00334 7B

DATA REQUIREMENTS

Research on Agrichemicals in Water Resources.
W91-00417 5B

DATA STORAGE AND RETRIEVAL

Interactive Groundwater Database System.
W91-00263 7C

Remote Data Collection and Control for Hydrogeologic Monitoring.
W91-00370 7B

National Water Information System User's Manual Volume 2, Chapter 3. Automated Data Processing System.
W91-00442 7C

Pesticides in Ground Water Data Base: 1988 Interim Report.
W91-00569 5B

Enhancement of the HWRIC Database, Year 2. With an Evaluation of Database Content.
W91-00571 7C

DATA TRANSMISSION

Satellite Teletransmission: Technology Applied to Hydrological Forecasting. An Example of the Fight against Onchocercosis (La Teletransmission par Satellite: Une Technologie Adaptee a la Prevision Hydrologique. Exemple de la Lutte contre l'Onchocerose).
W91-00475 7B

DATABASES

Interactive Groundwater Database System.
W91-00263 7C

National Water Information System User's Manual Volume 2, Chapter 3. Automated Data Processing System.
W91-00442 7C

Sources of Water-Use Information in Maine.
W91-00443 6D

DATABASES

Pesticides in Ground Water Data Base: 1988 Interim Report.
W91-00569 5B

Enhancement of the HWRIC Database, Year 2. With an Evaluation of Database Content.
W91-00571 7C

Generalized Components of Complex Decision Support Systems for Water Resources Management in River Basins.
W91-00997 4A

Environmental Geographic Information System in Finland.
W91-01003 7C

DEAD SEA
Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

Nutrients in Pore Waters from Dead Sea Sediments.
W91-00742 2H

Solubility of Oxygen in the Dead Sea Brine.
W91-00744 2K

DEBRIS BASINS
Risk of Debris-basin Failure.
W91-00181 8A

DECHLORINATION
Method for Determining the Completeness of Dechlorination with Sulfite.
W91-00532 5D

DECIDUOUS TREES
Estimates of Ion Sources in Deciduous and Coniferous Throughfall.
W91-00415 5B

DECISION MAKING
Decision-Making Process on the Danube and the Platte.
W91-00088 6B

Generalized Components of Complex Decision Support Systems for Water Resources Management in River Basins.
W91-00997 4A

Object-Oriented Hydrological Modelling (Modelisation Hydrologique Orientee Object).
W91-00999 2A

DECOMPOSITION
Production and Decomposition in a Saline Meromictic Lake.
W91-00746 2H

DEEP-SHAFT WET-AIR OXIDATION
Deep-Shaft Wet-Air Oxidation.
W91-00938 5D

DEGRADATION
Degradation of Polyphenols in Five Plant Species in the Aquatic Environment (Degradacao de Ploifenois em Cinco Especies Vegetais em Ambientes Aquaticos).
W91-00821 2H

DEHALOGENATION
Dechlorination of Four Commercial Polychlorinated Biphenyl Mixtures (Aroclors) by Anaerobic Microorganisms from Sediments.
W91-00827 5B

Dehalogenation.
W91-00926 5D

DEICERS
Subsurface Transport of Inorganic and Organic Solutes from Experimental Road Spreading of Oil-Field Brine.
W91-00365 5B

DELAWARE RIVER
Report of the River Master of the Delaware River for the Period December 1, 1987 - November 30, 1988.
W91-00344 2E

DELHI
Soil Moisture Studies in Soils of Delhi Territory Using the Resistivity Meter.
W91-00258 2G

DENITRIFICATION
Microbiological and Chemical Investigations on a Biological, Autotrophic Denitrification Plant Using Hydrogen as an Energy Source.
W91-00024 5F

Using Isotope Fractionation of Nitrate-Nitrogen and Nitrate-Oxygen for Evaluation of Microbial Denitrification in a Sandy Aquifer.
W91-00166 5B

Nitrous Oxide Dissolved in Soil Solution: An Insignificant Pathway of Nitrogen Loss from a Southeastern Hardwood Forest.
W91-00613 2G

DENSITY CURRENTS
Laterally Averaged Hydrodynamics Model for Reservoir Predictions.
W91-00062 2H

DENUDATION
Spatial Variations in the Rate of Fluvial Erosion (Sediment Production) over South Africa.
W91-00635 2J

DEPTH-AREA-DURATION ANALYSIS
Dynamic Model for Short-scale Rainfall Disaggregation.
W91-00409 2B

DESIGN CRITERIA
Geomorphic Design and Management of Disturbed Lands.
W91-00296 4C

Safety Goals for High-Hazard Dams: Are Dams Too Safe.
W91-00587 8A

Rotary Kilns.
W91-00931 5D

DESIGN FLOODS
Regional Methods for Estimation of Design Floods for Small to Medium Sized Drainage Basins in Australia.
W91-00986 2E

Determination of Design Flood Hydrographs Based on Regional Hydrological Data.
W91-00987 2E

Assessment of the US Conservation Service Method for Estimating Design Floods.
W91-00989 2E

DESIGN STANDARDS
Appropriate Well Design for Developing Fresh Water Aquifer in a Mixed Quality Aquifer System.
W91-00221 8A

Five Worst Superfund Design Mistakes.
W91-00363 5G

DESIGN STORMS
Areal Reduction Factors for Design Storm Construction: Joint Use of Raingauge and Radar Data.
W91-00965 2B

DESMIDS
Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

DETECTION LIMITS
Environmental Russian Roulette: Compliance at or Near the Detection Level.
W91-00802 5G

DETENTION RESERVOIRS
Single-Outlet Detention-Pond Analysis and Design.
W91-00171 8A

Design of Detention Basins for Industrial Sites.
W91-00188 5D

DETOXIFICATION
Enzyme System and Related Reactive Species.
W91-00947 5D

DEUTERIUM
Method to Extract Soil Water for Stable Isotope Analysis.
W91-00898 2G

DEVELOPING COUNTRIES
Potential Coastal Impacts of Contemporary Changing Climate on South Asian Seas States.
W91-00027 4C

Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume I.
W91-00215 4B

Rural Water Supply Investigations in Scarcity Villages in Bhandara District, Maharashtra.
W91-00222 7B

Trends in Irrigation Development, and Their Implications for Hydrologists and Water Resources Engineers.
W91-00377 3F

Pesticides and Wetlands Overseas: A Framework for Mitigating Adverse Impacts.
W91-00570 5G

DIATOMS
Mechanism of Toxicity of Zinc to the Marine Diatom Nitzschia closterium.
W91-00729 5C

Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

Studies on the Algae of a Small Softwater Stream I. Occurrence and Distribution with Particular Reference to the Diatoms.
W91-00869 2H

Studies on the Algae of a Small Softwater Stream III. Interaction between Discharge, Sediment Composition and Diatom Flora.
W91-00871 2H

DIFFUSERS
Accuracy of Hydrant Flow Tests Using a Pitot Diffuser.
W91-00378 7B

DIFFUSIVITY
Note on the Analysis of Moisture-Depth Curves Obtained by the Hot-Air Method for the Determination of Soil Moisture Diffusivity.
W91-00889 2G

DIGESTED SLUDGE
Improving the Sludge Conditioning Potential of Moringa Seed.
W91-00028 5D

DIGITAL MAP DATA
Digital Enhancement of Surface Geologic Features in a Part of Banas River Catchment for Ground Water Potential Characterization.
W91-00252 7C

DINARIC KARST
Hydrogeology of the Dinaric Karst.
W91-00318 2F

Hydrogeologic Features of the Dinaric Karst.
W91-00321 2F

Speleological Phenomena of Dinaric Karst.
W91-00322 2F

Karst Poljes in Dinarides.
W91-00323 2F

Hydrogeologic Features of Typical Karst Terrains in Montenegro.
W91-00328 2F

Hydrogeological Features of Some Northern Dalmatia Littoral Karst Parts, Lika and Croatian Littoral.
W91-00329 2F

Hydrogeologic Features of Some Karst Parts of Slovenia.
W91-00330 2F

DIOXINS
Dehalogenation.
W91-00926 5D

DISCHARGE CAPACITY
Flow Resistance in Compound Channels.
W91-00037 2E

DISCHARGE HYDROGRAPHS
Discharge characteristics of Local Discontinuous Contractions, II.
W91-00762 8B

DISCHARGE MEASUREMENT
Comparison of Tracer-Dilution and Current-Meter Discharge Measurements in a Small Gravel-Bed Stream, Little Lost Man Creek, California.
W91-00337 2E

DISDROMETERS
Effect of Irregularities in the Diameter Classification of Raindrops by the Joss-Waldvogel Disdrometer.
W91-00141 2B

DISINFECTION
Disinfecting Biofilms in a Model Distribution System.
W91-00382 5F

Disinfection of Drinking Water by Filtration through Silver Impregnated Alumina.
W91-00391 5F

Basic Guidelines for Specifying the Design of Ultraviolet Disinfection Systems.
W91-00401 5D

Water Chlorination: The Challenge.
W91-00478 5F

South Australian Water: A Disinfection Problem.
W91-00480 5F

Chlorinated Hydrocarbons and Water Quality Issues in the New York City Municipal Water Supply.
W91-00481 5F

Health Effects of Disinfectants and Disinfection By-Products: A Regulatory Perspective.
W91-00482 5F

Regulatory Effects on the Practice of Drinking Water Treatment.
W91-00483 5F

Trihalomethanes: Is Swimming Pool Water Hazardous.
W91-00484 5F

Production of Organic Chemicals and Mutagens during Chlorination of Amino Acids in Water.
W91-00485 5F

Identification of the Strong Mutagen 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone and Its Geometric Isomer E-2-Chloro-3-(dichloromethyl)-4-oxobutenoic Acid in Mutagenic Fractions of Chlorine-Treated Humic Water and in Drinking Waters.
W91-00487 5F

Comparison of Mutagenic Activity of Chlorinated Aquatic and Commercial Humic Substances.
W91-00488 5C

Chlorination of Aquatic Fulvic Acid and Natural Waters: Additional By-products.
W91-00490 5F

Mutagenicity of the Nonvolatile Reaction Products of Aqueous Chlorination of L-Tryptophan.
W91-00491 5C

Carcinogenicity of Chlorinated Acetic Acids.
W91-00492 5C

Comparison of Drinking Water Disinfectants Using Mutagenicity Testing.
W91-00493 5F

Organic Reactions of Chlorine Dioxide in Drinking Water-A Mutagenic Assessment.
W91-00494 5F

Mutagenic Activity of Concentrated Water Extracts in Cultured Mammalian Cells and Drosophila melanogaster.
W91-00495 5C

Evaluation of Protocol for Preparing Drinking Water Samples for Ames Mutagenicity Testing.
W91-00496 5A

Toxicological Effects Associated with Drinking Water Disinfectants and Their By-products.
W91-00497 5C

Association Between Chlorinated Drinking Water and Decreased Serum HDLc in Two Monkey Species During Dietary Atherogenic Stress.
W91-00498 5C

Effects of Drinking Water Chlorine on Human Lipid and Thyroid Metabolism.
W91-00499 5C

Effect of Drinking Water Containing Chlorine and Monochloramine on Cholesterol and Triglyceride Levels in the Liver of the Pigeon and Rabbit.
W91-00500 5C

Long-Term Effects of Chlorine-Containing Disinfectants on Plasma Levels of Cholesterol and Thyroxine in Rabbits and Pigeons.
W91-00501 5C

Biochemical Mechanisms of In Vitro Chloropropanone Toxicity.
W91-00502 5C

Case-Control Study of Colon Cancer and Volatile Organics in Wisconsin Municipal Groundwater Supplies.
W91-00506 5C

Further Studies of Hypochlorite Ion Pair Chemistry and Disinfection Efficiency.
W91-00531 5F

Method for Determining the Completeness of Dechlorination with Sulfite.
W91-00532 5D

Factors that Change Bacterial Resistance to Disinfection.
W91-00544 5F

Disinfection of Bacterial Biofilms.
W91-00545 5F

Modeling the Impact of Nitrogenous Compounds on Wastewater Disinfection.
W91-00546 5D

New Halamine Water Disinfectants.
W91-00547 5F

Inactivation of Enteric Viruses in Chlorinated Wastewater Sprayed on Vegetables.
W91-00548 5D

Use of Chlorine Dioxide in Disinfection of Wastewater.
W91-00549 5D

Emerging Issues for the Microbiology of Drinking Water.
W91-00627 5F

Efficacy of a Small-Quantity Water Treatment Method for Inactivating Giardia Cysts in Raw Water.
W91-00637 5F

Use of UV Radiation for Disinfecting Water in First Stage Growth Tanks Stocked with Rainbow Trout Larvae (Zastosowanie Promieniowania Uv Do Dezynfekcji Wody W Podchowalni Wylegu Pstraga).
W91-00786 8I

Photochemical Disinfection of Effluents-Pilot Plant Studies.
W91-00807 5D

DISPERSION
Theory of Subsurface Water-Borne Solute Transport.
W91-00119 5B

Simulation of Dispersion in Layered Coastal Aquifer Systems.
W91-00155 2F

Effect of Daytime Surface Evaporation on Pollution Dispersion.
W91-00848 5B

DISPOSAL WELLS
Ground Water Recharge and Pollution Potential of Dry Wells in Pima County, Arizona.
W91-00367 5B

DISSOLVED ORGANIC CARBON
Seasonal, Hydrological, and Land Management Factors Controlling Dissolved Organic Carbon Concentrations in the Loch Fleet Catchments, Southwest Scotland.
W91-00862 2H

DISSOLVED OXYGEN
Negative Oxygen Trends in Swedish Coastal Bottom Waters.
W91-00703 2K

Evaluating the Probability of Violating Dissolved Oxygen Standard.
W91-00715 5G

Effect of H2S on Heterotrophic Substrate Uptake, Extracellular Enzyme Activity and Growth of Brackish Water Bacteria.
W91-00730 2L

Seasonal Changes of the Environmental Conditions in Dimictic Lakes Differing as to Their Trophic State (Sezonowe Zmiany Warunkow Srodowiska w Jeziorach Dymiktycznych o Roznym Stopniu Eutrofizacji).
W91-00735 2H

Solubility of Oxygen in the Dead Sea Brine.
W91-00744 2K

DISSOLVED SOLIDS
Measurement of Biodegradable Organic Matter and Bacterial Growth Potential in Drinking Water.
W91-00381 5F

Synchronous Fluorescence Spectroscopy of Dissolved Organic Matter in Surface Waters: Application to Airborne Remote Sensing.
W91-00639 5A

DISTILLATION
Distillation.
W91-00913 5D

DISTRIBUTION PATTERNS
Distribution Patterns of Ostracods in Iberian Saline Lakes. Influence of Ecological Factors.
W91-00753 2H

DIVERSION
Report of the River Master of the Delaware River for the Period December 1, 1987 - November 30, 1988.
W91-00344 2E

DOCKS
Slips Ahoy.
W91-00677 8A

DOCUMENTATION
SOLINPUT: A Computer Code to Create and Modify Input Files for the Geochemical Program SOLMINEQ.88.
W91-00359 7C

National Water Information System User's Manual Volume 2, Chapter 3. Automated Data Processing System.
W91-00442 7C

DOMESTIC WATER
Measuring Economic Losses from Ground Water Contamination: An Investigation of Household Avoidance Costs.
W91-00086 5C

Corrosion and Water Quality.
W91-00411 5B

What to Consider When Selecting Your Water Supply.
W91-00414 5F

DRAINAGE
Fate of Aquatic and Wetland Habitats in an Industrially Contaminated Section of the Elbe Floodplain in Hamburg.
W91-00648 5B

Some Characteristics of Springs in High Elevation Alteritic Material: Their Contribution to the Understanding of the Intricacy of the Two-Layered 'Sand-Basement' Aquifer (Madagascar High Plateaux) (Caracteristiques d'Emergences en Milieu Alteritique d'Altitude: Leur Apport a la Comprehension de l'Aquifere Bicouche Arenes-socle (Hauts Plateaux de Madagascar)).
W91-00856 2F

DRAINAGE BASINS
Cost Impacts of Sediments in South African Rivers.
W91-00295 2J

DRAINAGE ENGINEERING
Effect of System Layout on Subsurface Drainage Cost in Flat Irrigated Land.
W91-00081 4B

Single-Outlet Detention-Pond Analysis and Design.
W91-00171 8A

Model of Flow in Regulated Open-channel Networks.
W91-00172 2E

DRAINAGE PATTERNS
Algorithm for Routing Unsteady Flows in Urban Drainage Networks.
W91-00031 4C

DRAINAGE SYSTEMS
Effect of System Layout on Subsurface Drainage Cost in Flat Irrigated Land.
W91-00081 4B

DRAINAGE WATER
Measurement of In Situ Rates of Selenate Removal by Dissimilatory Bacterial Reduction in Sediments.
W91-00620 5B

DRAWDOWN
Unsteady Drawdown of Water Table.
W91-00170 2F

Computation of Transmissivity from Step-Drawdown Tests.
W91-00220 2F

Capillarity Correction for Free Surface Flow Revisited.
W91-00614 4B

DREDGING
Dredging of North Park Lake, County of Allegheny, Pennsylvania.
W91-00564 5G

DREDGING WASTES
Macrofauna Distributions and Sediment Analyses from the Brunswick, Georgia Ocean Dredged Material Disposal Site and Environs.
W91-00444 5E

DRIFTING SNOW
Saltation of Snow.
W91-00603 2C

DRILL CUTTINGS
Effects of Drill Cuttings on a Model Marine Sediment System.
W91-00044 5C

DRILLING
Instrumentation and Technique of Groundwater Exploration (With Nature of Aquifer) in Unconsolidated Sediments (Gangetic Plains) of Uttar Pradesh, Northern India.
W91-00235 2F

DRILLING FLUIDS
Effects of Drill Cuttings on a Model Marine Sediment System.
W91-00044 5C

DRINKING WATER
Genotoxicity of Drinking Water: Significance and Future Approach.
W91-00023 5C

Disinfection of Drinking Water by Filtration through Silver Impregnated Alumina.
W91-00391 5F

Corrosion and Water Quality.
W91-00411 5B

Superfund Record of Decision: Beachwood/Berkeley, NJ.
W91-00451 5G

Regulatory Effects on the Practice of Drinking Water Treatment.
W91-00483 5F

Identification of the Strong Mutagen 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone and Its Geometric Isomer E-2-Chloro-3-(dichloromethyl)-4-oxobutenoic Acid in Mutagenic Fractions of Chlorine-Treated Humic Water and in Drinking Waters.
W91-00487 5F

Carcinogenicity of Chlorinated Acetic Acids.

W91-00476 5F

Toxicity and Fate of Total Residual Chlorine in Outdoor Experimental Streams.
W91-00513 5C

Effect of Toston Dam on Upstream Ice Conditions.
W91-00574 6G

Logging Effects on Streamflow: Storm Runoff at Caspar Creek in Northwestern California.
W91-00610 4C

Biomonitoring of Chemicals on Tropical Ecosystems.
W91-00823 5B

Seasonal, Hydrological, and Land Management Factors Controlling Dissolved Organic Carbon Concentrations in the Loch Fleet Catchments, Southwest Scotland.
W91-00862 2H

Evaluation and Prediction of Possible Man-Induced Changes in the Hydrological Cycle.
W91-00967 4C

ENVIRONMENTAL ENGINEERING
Crude Oil and Hydrocarbon-degrading Strains of Rhodococcus rhodochrous Isolated from Soil and Marine Environments in Kuwait.
W91-00144 5B

ENVIRONMENTAL IMPACT
Geomorphic Design and Management of Disturbed Lands.
W91-00296 4C

Water Resources Data Collected During Water Year 1988 at Selected James River Basin Sites in North Dakota and South Dakota.
W91-00342 6G

Preservation of Plant Polymers in Peat and Liberation of Their Monomers Due to Artificial Drainage.
W91-00643 2H

Pilot Studies for Designs of Surveys of Human Disturbance of Intertidal Habitats in New South Wales.
W91-00685 4C

ENVIRONMENTAL MONITORING
Conceptual Basis for Environmental Monitoring Programs.
W91-00794 7A

ENVIRONMENTAL POLICY
Endpoints for Regional Ecological Risk Assessments.
W91-00025 6G

Implications of Environmental Program Planning for Siting a Nuclear Waste Repository at Yucca Mountain, Nevada, USA.
W91-00026 5E

Environmental Russian Roulette: Compliance at or Near the Detection Level.
W91-00802 5G

ENVIRONMENTAL PROTECTION
Improving the Effectiveness of Fisheries Agencies in Developing Hydropower Mitigation.
W91-00008 6E

Use of Statistical Methods in Industrial Water Pollution Control Regulations in the United States.
W91-00125 5G

Continuous Effluent Consents: Modelling and Compliance Testing.
W91-00126 5G

Auditing the Quality of Effluent Discharges.
W91-00127 5G

Hazardous-Waste Treatment Comes of Age.
W91-00901 5G

Summary of Resource Conservation and Recovery Act Legislation and Regulation.
W91-00902 6E

Quantities and Sources of Hazardous Wastes.
W91-00905 5E

ENVIRONMENTAL TRACERS
Preliminary Assessment of the Potential for Using Cesium-137 to Estimate Rates of Soil Erosion in the Loess Plateau of China.
W91-00405 2J

Gas Exchange Rates for a First-Order Stream Determined with Deliberate and Natural Tracers.
W91-00606 2A

Using Rn222 to Examine Groundwater/Surface Discharge Interaction in the Rio Grande de Manati, Puerto Rico.
W91-00893 2F

ENZYMES
In Vitro Inhibition of Acetylcholinesterase from Four Marine Species by Organophosphates and Carbamates.
W91-00206 5A

Enzyme System and Related Reactive Species.
W91-00947 5D

EPIDEMIOLOGY
Review of Recent Epidemiological Studies Reporting Associations between Drinking Water Disinfection and Cancer.
W91-00505 5F

Health Effects of Hazardous Waste.
W91-00908 5C

EPILIMNION
Simulation Model of Phosphorus Cycling in the Epilimnion of a Eutrophic Lake.
W91-00003 2H

EROSION
Dimensionless Analytical Solutions for Dam-Breach Erosion.
W91-00069 8A

Comprehensive Generalized Study of Scour at Cantilevered Pipe Outlets.
W91-00072 8B

Influence of Sand or Gravel on the Erosion of Cohesive Sediment.
W91-00095 2J

Nitrogen and Phosphorus in Eroded Sediment from Corn and Soybean Tillage Systems.
W91-00281 5B

Cropping Systems Effects on Runoff, Erosion, Water Quality, and Properties of a Savanna Soil at Ilorin, Nigeria.
W91-00288 5B

Soil Erosion and Floodplain Soil Pollution: Related Problems in the Geographical Context of a River Basin.
W91-00289 5B

Spatial Variations in the Rate of Fluvial Erosion (Sediment Production) over South Africa.
W91-00635 2J

Water Quality and PAM interactions in Reducing Surface Sealing.
W91-00791 4D

Influence of the Angle of Incidence of the Rainfall on the Overland Flow Process.
W91-00969 2J

EROSION CONTROL
Targeting Remedial Measures to Control Nonpoint Source Pollution.
W91-00090 5G

Sediment and the Environment.
W91-00280 2J

Soil Erosion in the Yellow River Basin and Its Impacts on Reservoir Sedimentation and the Lower Yellow River.
W91-00294 2J

Geomorphic Design and Management of Disturbed Lands.
W91-00296 4C

Water Quality and PAM interactions in Reducing Surface Sealing.
W91-00791 4D

EROSION RATES
One-Dimensional Model for the Transport of a Sediment Mixture in Non-Equilibrium Conditions.
W91-00070 2J

Conversion of Braided Gravel-Bed Rivers to Single-Thread Channels of Equivalent Transport Capacity.
W91-00078 2J

Longshore-Transport Model for South Indian and Sri Lankan Coasts.
W91-00176 2L

Cost Impacts of Sediments in South African Rivers.
W91-00295 2J

Long and Short-term Episodic Storage and Removal of Sediment in Watersheds of Southwestern Wisconsin and Northwestern Illinois.
W91-00297 2J

Preliminary Assessment of the Potential for Using Cesium-137 to Estimate Rates of Soil Erosion in the Loess Plateau of China.
W91-00405 2J

Spatial Variations in the Rate of Fluvial Erosion (Sediment Production) over South Africa.
W91-00635 2J

ERROR ANALYSIS
Errors in Estimated Streamflow Parameters and Storages for Ungauged Catchments.
W91-00085 2E

Effect of Oblique Rain on Inclined Surfaces: A Nomograph for the Rain-Gauge Correction Factor.
W91-00899 7B

ESCHERICHIA COLI
Inactivation of E. coli Suspension by Chlorine: Implication of Chlorination of Alpha-Amino Acids and Uracil.
W91-00535 5F

F-specific RNA Bacteriophages and Sensitive Host Strains in Faeces and Wastewater of Human and Animal Origin.
W91-00872 5A

ESTIMATING
Simplified Methods of Estimating Daily Mean Stream Water Temperature.
W91-00421 2E

ESTIMATING EQUATIONS
Estimates of Evapotranspiration in Alkaline Scrub and Meadow Communities of Owens Valley, California, Using the Bowen-Ratio, Eddy-Correlation, and Penman-Combination Methods.
W91-00333 2D

Bias and Variance of some Estimators of Suspended Sediment Load.
W91-00406 2J

ESTUARIES
Effects of a Fixed-Crest Weir on Brown Shrimp Penaeus aztecus Growth, Mortality, and Emigration in a Louisiana Coastal Marsh.
W91-00010 8I

Geomorphological Effects of Catastrophic Flooding on a Small Subtropical Estuary.
W91-00049 2J

Ecology of Marine Benthic Dipterans in a Tidal Creek of Hooghly Estuary, Sagar Island, India.
W91-00051 2L

Improvement of Bypassing and Backpassing at Tidal Inlets.
W91-00178 8A

Optimization of Freshwater Inflow to Estuaries.
W91-00187 2L

Field Evaluation of the Effect of Chlorinated Treated Sewage on Settlement of Oysters (Crassostrea virginica Gmelin) and Barnacles (Balanus sp).
W91-00511 5C

Potential Bio-available Phosphorus in Sediments of the River Elbe in Northern Germany.
W91-00651 2L

Ecology of a Mediterranean-Climate Estuarine Wetland at Carpinteria, California: Plant Distributions and Soil Salinity in the Upper Marsh.
W91-00675 2L

Biology and Ecology of Brachyuran Decapod Crustaceans in the Bay/Estuary System of Santos and Sao Vincente (Sao Paulo): 1. Occurrence and Species Composition (Bioecologia de Crustaceos Decapodos, Braquiuros, No Sistema Baia-Estuario de Santos e Sao Vincente, SP: 1. Ocorrencia e Composicao).
W91-00690 2L

Qualitative and Numerical Analyses of the Effects of River Inflow Variations on Mixing Diagrams in Estuaries.
W91-00720 2L

Survey of the Protein Content in Estuarine Waters.
W91-00795 2L

ESTUARINE ECOSYSTEMS
Ecology of Marine Benthic Dipterans in a Tidal Creek of Hooghly Estuary, Sagar Island, India.
W91-00051 2L

ESTUARINE ENVIRONMENT
Potential for Agricultural Pesticide Runoff to a Puget Sound Estuary: Padilla Bay, Washington.
W91-00204 5B

Benthic Macrofauna and Ancillary Data for San Francisco Bay, California, January to November 1988.
W91-00343 2L

Distributions and Population Structures of Two Intertidal Estuarine Polychaetes in the Lower St. Lawrence Estuary, with Special Reference to Environmental Factors.
W91-00383 2L

ESTUARINE FISHERIES
Patterns of Fish Spawning in Hudson River Tributaries: Response to an Urban Gradient.
W91-00617 8I

ESTUARINE SEDIMENTS
Geochemical Study of Sediment Contamination in New Bedford Harbor, Massachusetts.
W91-00043 5B

Distributions and Population Structures of Two Intertidal Estuarine Polychaetes in the Lower

St. Lawrence Estuary, with Special Reference to Environmental Factors.
W91-00383 2L

ETHIOPIA
Degradation of a Stream Crossing the City of Addis Ababa, Ethiopia.
W91-00680 5C

ETHYLENEDIAMINE TETRAACETIC ACID
Implications of Heavy Metal Toxicity Related to EDTA Exposure.
W91-00792 5C

EUCALYPTUS TREES
Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.

Jakosciowa I Ilosciowa Analiza Pokarmu Oraz Wybiorczosc Pokarmowa).
W91-00784 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: III. Attempt to Evaluate the Pressure on Plankton of the Introduced Fish Population (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: III. Proba Oceny Presji Introdukowanej Populacji Ryb Na Plankton).
W91-00785 8I

Use of UV Radiation for Disinfecting Water in First Stage Growth Tanks Stocked with Rainbow Trout Larvae (Zastosowanie Promieniowania Uv Do Dezynfekcji Wody W Podchowalni Wylegu Pstraga).
W91-00786 8I

FISHERIES
Improving the Effectiveness of Fisheries Agencies in Developing Hydropower Mitigation.
W91-00008 6E

Estimating the Carrying Capacity of a Coastal Inlet for Mussel Culture.
W91-00666 2L

FJORDS
Locating and Identifying Hydraulic Controls for Layered Flow Over an Obstruction.
W91-00374 2L

Negative Oxygen Trends in Swedish Coastal Bottom Waters.
W91-00703 2K

Effects of Changes in Sewage Pollution on Soft-Bottom Macrofauna Communities in the Inner Oslofjord, Norway.
W91-00788 5C

FLAGELLATES
Photosynthesis of Dunaliella parva Lerche as a Function of Temperature, Light and Salinity.
W91-00750 2H

FLAP GATES
Energy Head Implications of the Installation of Circular Flap Gates on Drainage Outfalls.
W91-00068 8C

FLASH FLOODS
Analysis of Instantaneous Rainfall Rate during Flash Floods in Barcelona.
W91-00189 2B

FLIES
Mutagenic Activity of Concentrated Water Extracts in Cultured Mammalian Cells and Drosophila melanogaster.
W91-00495 5C

FLOATING PLANTS
Increase in the Oxygen Concentration in Amazon Waters Resulting from the Root Exudation of Two Notorious Water Plants, Eichhornia crassipes (Pontederiaceae) and Pistia stratiotes (Araceae).
W91-00822 2H

FLOCCULATION
Flocculation of Suspended Solids in Southern Ontario Rivers.
W91-00291 2J

FLOOD BASINS
Assessment of Network Models in Flood Forecasting.
W91-00973 2E

Floods and Droughts in Labe River Basin: The Hydrograph Shape.
W91-00975 2E

Geomorphoclimatic Derivation of Flood Frequency (Peak and Volume) at the Basin and Regional Scale.
W91-00978 2E

FLOOD CHANNELS
Flow Resistance in Compound Channels.
W91-00037 2E

Prediction of Flow Characteristics in Main Channel/Flood Plain Flows.
W91-00073 8B

FLOOD CONTROL
Utility Approach to Stormwater Management.
W91-00104 4A

Flooding Controlled by Bridge Relocation.
W91-00105 4A

FLOOD DATA
Estimating Statistical Parameters for an N-Segment Discrete Hydrologic Data Series.
W91-00074 2E

Nonparametric Flood-frequency Analysis with Historical Information.
W91-00152 2E

Palaeoflood Hydrology: A Tool for South Africa--An Example from the Crocodile River near Brits, Transvaal, South Africa.
W91-00636 2E

FLOOD DISCHARGE
Estimating Statistical Parameters for an N-Segment Discrete Hydrologic Data Series.
W91-00074 2E

FLOOD FLOW
Hydrologic and Hydraulic Research in Mountain Rivers.
W91-00083 2E

Droughts and Floods: Their Definition and Modeling.
W91-00992 2E

FLOOD FORECASTING
Estimating Statistical Parameters for an N-Segment Discrete Hydrologic Data Series.
W91-00074 2E

Hydroclimatic Application Strategy for the Poisson Partial Duration Model.
W91-00084 2E

Nonparametric Flood-frequency Analysis with Historical Information.
W91-00152 2E

Analysis of Instantaneous Rainfall Rate during Flash Floods in Barcelona.
W91-00189 2B

Radar Data Processing for Hydrology in the Cevennes Region.
W91-00466 7B

Flood Monitoring from Space in China.
W91-00474 7B

Towards an Improved System for Weather Radar Calibration and Rainfall Forecasting Using Raingauge Data from a Regional Telemetry System.
W91-00963 2B

Areal Reduction Factors for Design Storm Construction: Joint Use of Raingauge and Radar Data.
W91-00965 2B

Entropy Based Method for Flood Forecasting.
W91-00972 2E

Assessment of Network Models in Flood Forecasting.
W91-00973 2E

Regionalization of Model Parameters for a Large Watershed.
W91-00979 2E

Regional Methods for Estimation of Design Floods for Small to Medium Sized Drainage Basins in Australia.
W91-00986 2E

Determination of Design Flood Hydrographs Based on Regional Hydrological Data.
W91-00987 2E

Regional Analysis of the Mean Annual Flood and of Flood Frequency Characteristics.
W91-00988 2E

Assessment of the US Conservation Service Method for Estimating Design Floods.
W91-00989 2E

Regional Flood Frequency Analysis Using Ridge Regression.
W91-00990 2E

Droughts and Floods: Their Definition and Modeling.
W91-00992 2E

FLOOD FREQUENCY
Estimating Statistical Parameters for an N-Segment Discrete Hydrologic Data Series.
W91-00074 2E

Nonparametric Flood-frequency Analysis with Historical Information.
W91-00152 2E

Geomorphoclimatic Derivation of Flood Frequency (Peak and Volume) at the Basin and Regional Scale.
W91-00978 2E

Regional Methods for Estimation of Design Floods for Small to Medium Sized Drainage Basins in Australia.
W91-00986 2E

Determination of Design Flood Hydrographs Based on Regional Hydrological Data.
W91-00987 2E

Regional Analysis of the Mean Annual Flood and of Flood Frequency Characteristics.
W91-00988 2E

Assessment of the US Conservation Service Method for Estimating Design Floods.
W91-00989 2E

Regional Flood Frequency Analysis Using Ridge Regression.
W91-00990 2E

FLOOD HYDROGRAPHS
Assessment of Network Models in Flood Forecasting.
W91-00973 2E

Floods and Droughts in Labe River Basin: The Hydrograph Shape.
W91-00975 2E

Determination of Design Flood Hydrographs Based on Regional Hydrological Data.
W91-00987 2E

FLOOD PEAK
Stormflow and Sediment Loss from Intensively Managed Forest Watersheds in East Texas.
W91-00087 4C

Use of Kinematic Wave Method to Assess Effects of Urban Development on Flood Peak Changes.
W91-00971 4C

Geomorphoclimatic Derivation of Flood Frequency (Peak and Volume) at the Basin and Regional Scale.
W91-00978 2E

FLOOD PLAIN MANAGEMENT
Flooding Controlled by Bridge Relocation.
W91-00105 4A

FLOOD PLAIN SEDIMENTS
Long and Short-term Episodic Storage and Removal of Sediment in Watersheds of Southwestern Wisconsin and Northwestern Illinois.
W91-00297 2J

FLOOD PLAINS
Improved Method of Calculation for Steady Uniform Flow in Prismatic Main Channel/Flood Plain Sections.
W91-00038 8B

Guide for Selecting Manning's Roughness Coefficients for Natural Channels and Flood Plains.
W91-00335 2E

Steady Uniform Flow in Prismatic Channels with Flood Plains.
W91-00761 2E

Nutrient Dynamics of Decomposing Leaves from Amazonian Floodplain Forest Species in Water.
W91-00824 2H

FLOOD ROUTING
Perturbation Solution of the Flood-Routing Problem.
W91-00763 7C

FLOOD STAGES
Regionalization of Model Parameters for a Large Watershed.
W91-00979 2E

FLOOD WARNING SYSTEMS
Towards an Improved System for Weather Radar Calibration and Rainfall Forecasting Using Raingauge Data from a Regional Telemetry System.
W91-00963 2B

FLOOD WAVES
Floods and Droughts in Labe River Basin: The Hydrograph Shape.
W91-00975 2E

FLOODING
Magpie Goose, Anseranus semipalmata, Nesting on the Mary River Floodplain, Northern Territory, Australia: Extent and Frequency of Flooding Losses.
W91-00688 2H

Transformation and Transport of Ammonium Nitrogen in a Flooded Organic Soil.
W91-00716 5B

FLOODS
Estimating Statistical Parameters for an N-Segment Discrete Hydrologic Data Series.
W91-00074 2E

Water Balance of Lake Rotoiti, North Island: Floods and Short-Circuiting of Inflows from Lake Rotorua.
W91-00077 2H

FLOODS

New Directions for Surface Water Modeling.
W91-00961 7C

Floods and Droughts in Labe River Basin: The Hydrograph Shape.
W91-00975 2E

Droughts and Floods: Their Definition and Modeling.
W91-00992 2E

FLORIDA

Vegetative Changes in a Wetland in the Vicinity of a Well Field, Dade County, Florida.
W91-00352 6G

Cost and Performance of Membranes for Organic Control in Small Systems: Flagler Beach and Punta Gorda, Florida.
W91-00448 5F

Potential Application of Satellite Data for Rainfall Estimation.
W91-00465 2B

FLOW

Discharge characteristics of Local Discontinuous Contractions, II.
W91-00762 8B

FLOW AROUND OBJECTS

Bed Form Resistances in Open Channel Flows.
W91-00063 8B

Local Scour Around Bridge Piers.
W91-00397 2J

FLOW CHARACTERISTICS

Local Scour Profiles Downstream of Hydraulic Jump.
W91-00032 8B

Hydraulic Jumps at Positive and Negative Steps.
W91-00034 8B

Classification of Unidirectional Three-layer Flow Over a Hump.
W91-00041 8B

Wave Type Flow at Abrupt Drops.
W91-00042 2E

Discharge characteristics of Local Discontinuous Contractions, II.
W91-00762 8B

FLOW CONTROL

Optimal Valve Control in Water-distribution Networks.
W91-00180 5F

Physical Habitat Simulation and Sedimentation.
W91-00303 4C

FLOW DISCHARGE

Flow Resistance in Compound Channels.
W91-00037 2E

Hysteresis and Nonlinearity of Discharge-Sediment Relationships in the Atchafalaya and Lower Mississippi Rivers.
W91-00292 2J

FLOW DURATION

Regional Flow-duration Curves for Ungauged Sites in Massachusetts.
W91-00185 2E

FLOW EQUATIONS

Accuracy of Hydrant Flow Tests Using a Pitot Diffuser.
W91-00378 7B

General Mass-Conservative Numerical Solution for the Unsaturated Flow Equation.
W91-00595 2G

FLOW MEASUREMENT

Cost Effectiveness of the Streamflow-Gaging Program in West Virginia.
W91-00331 2E

Analysis of Geophysical Well Logs and Flowmeter Measurements in Boreholes Penetrating Subhorizontal Fracture Zones, Lac Du Bonnet Batholith, Manitoba, Canada.
W91-00354 2F

Accuracy of Hydrant Flow Tests Using a Pitot Diffuser.
W91-00378 7B

FLOW MODELS

Classification of Unidirectional Three-layer Flow Over a Hump.
W91-00041 8B

Stability Limits for Preissmann's Scheme.
W91-00150 2E

Explicit Methods for 2-D Transient Free-surface Flows.
W91-00151 2E

Regional Flow-duration Curves for Ungauged Sites in Massachusetts.
W91-00185 2E

Using a Geographic Information System to Develop a Ground-Water Flow Model.
W91-00316 2F

Statistical Processor for Analyzing Simulations Made Using the Modular Finite-Difference Ground-Water Flow Model.
W91-00353 7C

Graphical Kernel System (GKS) Version of Computer Program MODPATH-PLOT for Displaying Path Lines Generated from the U.S. Geological Survey Three-Dimensional Ground-Water Flow Model.
W91-00361 7C

Accuracy of Hydrant Flow Tests Using a Pitot Diffuser.
W91-00378 7B

Coupled Simulation of Transient Bed Evolution in Alluvial Channels.
W91-00407 2J

Exact Solution for Flow of Slightly Compressible Fluids Through Multiple-Porosity, Multiple-Permeability Media.
W91-00588 2F

Multilayered Sharp Interface Model of Coupled Freshwater and Saltwater Flow in Coastal Systems: Model Development and Application.
W91-00591 2F

Analytical Solutions of the One-Dimensional Advection Equation and Two or Three-Dimensional Dispersion Equation.
W91-00594 5B

General Mass-Conservative Numerical Solution for the Unsaturated Flow Equation.
W91-00595 2G

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 1. Theory.
W91-00601 2F

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 2. Application to Owens Valley, California.
W91-00602 2F

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 1. Models, Model Properties, and Experimental Design.
W91-00604 2A

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 2. Hydrologic Responses for Normal and Extreme Rainfall.
W91-00605 2A

Steady Uniform Flow in Prismatic Channels with Flood Plains.
W91-00761 2E

Non-Linear System to Describe Movements of Water Masses at the LG-2 Reservoir (La Grande, Quebec).
W91-00885 2H

Relative Performance of a Soil Moisture Accounting Model in Estimating Return Flow.
W91-00887 2G

Topographic Effects on Flow Path and Surface Water Chemistry of the Llyn Brianne Catchments in Wales.
W91-00888 2E

Regionalization of Low Flow Characteristics Using Logistic and GLS Regression.
W91-00993 2E

Characteristics of Streamflow Drought.
W91-00994 2E

FLOW PATTERN

Daily Flow Forecasting with Regression Analysis.
W91-00634 2E

Perturbation Solution of the Flood-Routing Problem.
W91-00763 7C

FLOW PROFILES

Measures of Flow Variability for Great Lakes Tributaries.
W91-00136 2E

Topographic Effects on Flow Path and Surface Water Chemistry of the Llyn Brianne Catchments in Wales.
W91-00888 2E

FLOW RATES

Effects of Sediment and Flow Regime on the Aquatic Insects of a High Mountain Stream.
W91-00776 2H

Enhancement of Benthic Macroinvertebrates by Minimum Flow from a Hydroelectric Dam.
W91-00778 6G

FLOW RESISTANCE

Flow Resistance in Compound Channels.
W91-00037 2E

Bed Form Resistances in Open Channel Flows.
W91-00063 8B

FLOW VELOCITY

Menu of Coupled Velocity and Sediment-discharge Relations for Rivers.
W91-00149 2J

Application of Radioactive Tracer Techniques for Determining Groundwater Velocity and Direction.
W91-00223 7B

FLOWING WELLS

Remote-Sensing Application to Well Monitoring.
W91-00169 2F

FLUID FLOW

Exact Solution for Flow of Slightly Compressible Fluids Through Multiple-Porosity, Multiple-Permeability Media.
W91-00588 2F

General Mass-Conservative Numerical Solution for the Unsaturated Flow Equation.
W91-00595 2G

FLUID MECHANICS
Variational Principle Method with Variable Domain in the Flow Problem with Free Surface.
W91-00122 8B

FLUIDIZED BED PROCESS
Use of a Gel-Forming Biopolymer Directly Dispensed into a Loop Fluidized Bed Reactor to Recover Dissolved Copper.
W91-00813 5D

Fluidized-Bed Thermal Oxidation.
W91-00932 5D

FLUMES
Prediction of Flow Characteristics in Main Channel/Flood Plain Flows.
W91-00073 8B

FLUORESCENCE
Fluorescent Polycyclic Aromatic Hydrocarbons as Probes for Studying the Impact of Colloids on Pollutant Transport in Groundwater.
W91-00623 5B

Synchronous Fluorescence Spectroscopy of Dissolved Organic Matter in Surface Waters: Application to Airborne Remote Sensing.
W91-00639 5A

FLUORIDES
Effect of Fluoride Complexation on Aluminum Toxicity Towards Juvenile Atlantic Salmon (Salmo salar).
W91-00663 5C

Tolerance of Scapania undulata (L.)Dum. to Fluoride.
W91-00835 5C

FLY ASH
Identification of Solubility-Controlling Solid Phases in a Large Fly Ash Field Lysimeter.
W91-00621 5B

FOG
Comparison of Two Cloudwater/Fogwater Collectors: The Rotating Arm Collector and the Caltech Active Strand Cloudwater Collector.
W91-00844 7B

Chemical Composition Differences in Fog and Cloud Droplets of Different Sizes.
W91-00854 2B

FOOD ANALYSIS
Determination of Fungistatic Quaternary Ammonium Compounds in Beverages and Water Samples by High-Performance Liquid Chromatography.
W91-00724 5A

FOOD CHAINS
Manipulating Lake Community Structure: Where Do We Go from Here.
W91-00428 2H

FORECASTING
Generalized Components of Complex Decision Support Systems for Water Resources Management in River Basins.
W91-00997 4A

FOREST ECOSYSTEMS
Nutrient Dynamics of Decomposing Leaves from Amazonian Floodplain Forest Species in Water.
W91-00824 2H

FOREST FERTILIZATION
Posttreatment Effects of Forest Fertilization on the Predominant Benthic Community of a Headwater Stream in Eastern Kentucky.
W91-00109 5C

FOREST HYDROLOGY
Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

Depletion and Recharge of Soil Water in Two Stands of Norway Spruce (Picea abies (L.) Karst).
W91-00860 2G

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

Diurnal Fluctuation in Stream Flow and in Specific Electric Conductance During Drought Periods.
W91-00881 2E

Chemical Studies of Chloride and Stable Oxygen Isotopes in Two Conifer Afforested and Moorland Sites in the British Uplands.
W91-00890 2D

FOREST MANAGEMENT
Stormflow and Sediment Loss from Intensively Managed Forest Watersheds in East Texas.
W91-00087 4C

Logging Effects on Streamflow: Water Yield and Summer Low Flows at Caspar Creek in Northwestern California.
W91-00611 3B

FOREST SOILS
Nitrous Oxide Dissolved in Soil Solution: An Insignificant Pathway of Nitrogen Loss from a Southeastern Hardwood Forest.
W91-00613 2G

Depletion and Recharge of Soil Water in Two Stands of Norway Spruce (Picea abies (L.) Karst).
W91-00860 2G

FOREST WATERSHEDS
Input and Depletion of Woody Debris in Alaska Streams and Implications for Streamside Management.
W91-00011 4C

Stormflow and Sediment Loss from Intensively Managed Forest Watersheds in East Texas.
W91-00087 4C

Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

Comparative Analysis of Aluminum Biogeochemistry in a Northeastern and a Southeastern Forested Watershed.
W91-00590 2K

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

Chemical Studies of Chloride and Stable Oxygen Isotopes in Two Conifer Afforested and Moorland Sites in the British Uplands.
W91-00890 2D

Groundwater Response to Reforestation in the Darling Range of Western Australia.
W91-00892 2F

Effects of Catchment Liming and Afforestation on the Concentration and Fractional Composition of Aluminum in the Loch Fleet Catchment, SW Scotland.
W91-00897 5G

FORESTRY
Posttreatment Effects of Forest Fertilization on the Predominant Benthic Community of a Headwater Stream in Eastern Kentucky.
W91-00109 5C

Credentialing in the Forestry Profession.
W91-00276 6E

Seasonal, Hydrological, and Land Management Factors Controlling Dissolved Organic Carbon Concentrations in the Loch Fleet Catchments, Southwest Scotland.
W91-00862 2H

FOURIER ANALYSIS
Fourier and Moment Methods Applied to Two-Dimensional Raindrop Images.
W91-00055 2B

FRANCE
Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

FREE SURFACES
Variational Principle Method with Variable Domain in the Flow Problem with Free Surface.
W91-00122 8B

FREEZE-CRYSTALLIZATION
Freeze-Crystallization.
W91-00921 5D

FREEZING
Physical Chemical Properties of Uncharged Water Clusters and One-Dimensional Ice Based on Quantal Calculations.
W91-00667 2C

FREEZING SOIL
Zero-Curtain Effect: Heat and Mass Transfer Across an Isothermal Region in Freezing Soil.
W91-00597 2C

FREQUENCY ANALYSIS
Regional Flood Frequency Analysis Using Ridge Regression.
W91-00990 2E

FREQUENCY DISTRIBUTION
Continuous Effluent Consents: Modelling and Compliance Testing.
W91-00126 5G

FRESHWATER
Optimization of Freshwater Inflow to Estuaries.
W91-00187 2L

Simplified Methods of Estimating Daily Mean Stream Water Temperature.
W91-00421 2E

Interactions Among Nutrients, Algae and Invertebrates in a New Zealand Mountain Stream.
W91-00422 2E

Water Temperature in a Stream Gravel Bed and Implications for Salmonid Incubation.
W91-00427 8I

Manipulating Lake Community Structure: Where Do We Go from Here.
W91-00428 2H

Bacterial Regeneration of Ammonium and Phosphate as Affected by the Carbon:Nitrogen:Phosphorus Ratio of Organic Substrates.
W91-00732 5B

FROST
Zero-Curtain Effect: Heat and Mass Transfer Across an Isothermal Region in Freezing Soil.
W91-00597 2C

FROZEN GROUND
Zero-Curtain Effect: Heat and Mass Transfer Across an Isothermal Region in Freezing Soil.
W91-00597 2C

FUEL
Cement Kilns.
W91-00933 5D

FULVIC ACIDS
Chlorination of Aquatic Fulvic Acid and Natural Waters: Additional By-products.
W91-00490 5F

FUMIGANTS
SOC (Synthetic Organic Compounds) Rejection by Nanofiltration.
W91-00449 5F

FUNGICIDES
Determination of Fungistatic Quaternary Ammonium Compounds in Beverages and Water Samples by High-Performance Liquid Chromatography.
W91-00724 5A

FUTURE PLANNING
Potential Coastal Impacts of Contemporary Changing Climate on South Asian Seas States.
W91-00027 4C

Hydrology Past and Present.
W91-00066 2A

Present and Future Perspectives of Water Resources in Developed Countries.
W91-00067 6A

GAMMARUS
Behavioral Changes in Gammarus pulex and Its Significance in the Toxicity Assessment of Very Low Levels of Environmental Pollutants.
W91-00207 5C

GAS CHROMATOGRAPHY
Simple Device for the Determination of Volatile Chlorinated Hydrocarbons in Water by Gas Chromatography.
W91-00727 5A

GAS EXCHANGE
Gas Exchange Rates for a First-Order Stream Determined with Deliberate and Natural Tracers.
W91-00606 2A

GAS LIQUID CHROMATOGRAPHY
Determination of Resin and Fatty Acids in Pulp and Paper Mill Effluents and White Waters by Gas-Liquid Chromatography.
W91-00726 5A

GASOLINE
Soil-Gas Surveying for Subsurface Gasoline Contamination Using Total Organic Vapor Detection Instruments: Part I. Theory and Laboratory Experimentation.
W91-00368 5A

GATES
Energy Head Implications of the Installation of Circular Flap Gates on Drainage Outfalls.
W91-00068 8C

GAULA RIVER
Time Series Analysis of Unequally Spaced Observations-With Applications to Copper Contamination of the River Gaula in Central Norway.
W91-00128 5B

GEESE
Magpie Goose, Anseranus semipalmata, Nesting on the Mary River Floodplain, Northern Territory, Australia: Extent and Frequency of Flooding Losses.
W91-00688 2H

Effect of Water Depth and Clipping Frequency on the Growth and Survival of Four Wetland Plant Species.
W91-00836 2J

GELS
Use of a Gel-Forming Biopolymer Directly Dispensed into a Loop Fluidized Bed Reactor to Recover Dissolved Copper.
W91-00813 5D

GENOTOXICITY
Genotoxicity of Drinking Water: Significance and Future Approach.
W91-00023 5C

GEOCHEMISTRY
Geochemical Study of Sediment Contamination in New Bedford Harbor, Massachusetts.
W91-00043 5B

Evaluation of Hydrogeochemical Parameters with Spontaneous Potential Logs.
W91-00157 7B

Hydrochemical Characterization of Groundwater Mixing in Sedimentary and Metamorphic Reservoirs with Combined Use of Piper's Principle and Factor Analysis.
W91-00164 2K

Environmental Chloride Method for Groundwater Recharge Studies: Potentialities and Limitations.
W91-00226 2F

Rate of Sedimentation and Geochemistry of Southeastern Hudson Bay, Canada.
W91-00284 2J

Geochemistry of Water Associated with the Navajo Sandstone Aquifer, San Rafael Swell Area, Utah.
W91-00312 2F

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

SOLINPUT: A Computer Code to Create and Modify Input Files for the Geochemical Program SOLMINEQ.88.
W91-00359 7C

Geochemistry of Iron in a Sand Dune Aquifer, Near Coos Bay and North Bend, Oregon.
W91-00430 2K

Sediment-Water Interaction as a Control on Geochemical Evolution of Playa Lake Systems in the Australian Arid Interior.
W91-00736 2H

Metal Concentrations in Surficial Sediments from Hypersaline Lakes, Australia.
W91-00737 2K

Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

Evolution of Saline Lake Waters: Gradual and Rapid Biogeochemical Pathways in the Basotu Lake District, Tanzania.
W91-00739 2H

Hydrogeochemistry of Lake Gallocanta (Aragon, NE Spain).
W91-00740 2H

Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

Classification of Shallow Groundwater Types in a Dutch Coversand Landscape.
W91-00895 2K

GEOELECTRICAL SOUNDINGS
Deep Geoelectrical Soundings and Shapes of Curves Used for Recommendations of Bore Sites in Basaltic Terrain.
W91-00247 7B

GEOGRAPHIC INFORMATION SYSTEMS
Using a Geographic Information System to Develop a Ground-Water Flow Model.
W91-00316 2F

Hydrological Effects of Catchment Characteristics and Land Use Changes Determined by Satellite Imagery and GIS.
W91-00472 2A

Object-Oriented Hydrological Modelling (Modelisation Hydrologique Orientee Object).
W91-00999 2A

Deriving Stream Parameters for Hydrologic Modeling from Digital Elevation Data.
W91-01000 2E

Intelligent Geographic Information Systems (IGIS) and Surface Water Modeling.
W91-01001 4A

Environmental Geographic Information System in Finland.
W91-01003 7C

Using GIS to Assess Spatial Variability of SCS Curve Number at the Basin Scale.
W91-01004 2E

GEOHYDROLOGY
Geologic and Hydrologic Issues Related to Siting a Repository for High-level Nuclear Waste at Yucca Mountain, Nevada, U.S.A.
W91-00030 5E

Evaluation of Hydrogeochemical Parameters with Spontaneous Potential Logs.
W91-00157 7B

Rural Water Supply Investigations in Scarcity Villages in Bhandara District, Maharashtra.
W91-00222 7B

Joint System Analysis for the Evaluation of Flow in Fractured Aquifer.
W91-00228 7C

Approach in Determination of Aquifer Geometry and Estimation of Aquifer Parameters of an Areally Extensive Upper Kamthi Sandstone Aquifer in Parts of Godavari Valley, Andhra Pradesh.
W91-00231 2F

Submersible Pump Tests Conducted on Bores Drilled by D.T.H. Compressor Rigs and the Comparison of Two Discharges.
W91-00232 2F

Aquifer Parameter Estimation and Groundwater Potentiality in Granite-Basalt Terrain Near Hyderabad, India.
W91-00233 2F

Investigations of Groundwater Resources at Selected Levels in Droughtprone Area of Pahari Block, District Mirzapur, U.P., India.
W91-00237 2F

More Accurate Determination of Aquifer Parameters Using the IP Sounding Method.
W91-00238 7B

Integrated Geological and Geophysical Investigations for Delineating Karstic Zones in Carbonate Formations of Anantapur District, A.P., India.
W91-00239 2F

Hydrogeological Study of Laterite at a Representative Dam Site in Malvan Valley of Konkan Region (Maharashtra-India) Using Seismic Refraction Method.
W91-00240 2F

Hydrogeophysical Studies for Characterizing the Crystalline Aquifers of Tambraparni Basin, Tamil Nadu, India.
W91-00242 2F

Radial Vertical Electrical Soundings: A Case Study in Groundwater Exploration.
W91-00246 2F

Fracture Pattern Modelling for Groundwater Targetting in Hard Rock Terrain: A Study Aided by Remote Sensing Technique.
W91-00250 7C

Role of Hydrogeological Set Up in the Yield of Wells in Granite Terrain: Case Histories of Nizamabad, Warangal and Hindupur Areas.
W91-00253 2F

Remote Sensing Based Appropriate Methodology for the Groundwater Exploration: A Case Study from Pre-Cambrians of South India.
W91-00254 7C

Environmental Isotope-Aided Study on River Water and Groundwater Interaction in the Region of Seoul and Taegu.
W91-00257 2A

Acquisition of Hydrogeologic Data for the Mapping of Shallow Unconfined Deccan Basaltic Aquifers from Maharashtra, India.
W91-00266 2F

Aquifers of the Western Mountain Area.
W91-00304 2F

Regional Bedrock Aquifers of the Northern Great Plains, North-Central United States.
W91-00305 2F

Snake River Plain Regional Aquifer System Study.
W91-00306 2F

Ground-Water Flow Systems of Western Utah.
W91-00307 2F

Upper Colorado River Basin Regional Aquifer-Systems Analysis: Mesozoic Rocks in Colorado, Utah, and Wyoming, Arizona, and New Mexico.
W91-00308 2F

Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Lithologic and Hydrologic Properties of Mesozoic Rocks in the Upper Colorado River Basin.
W91-00310 2F

Hydrology of the Navajo Sandstone in Southeastern and Southern Utah.
W91-00311 2F

Geochemistry of Water Associated with the Navajo Sandstone Aquifer, San Rafael Swell Area, Utah.
W91-00312 2F

Hydrostratigraphic Characterization of Paleozoic Formations in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00313 2F

Geophysically Determined Porosity of Paleozoic Rocks in the Upper Colorado River Basin.
W91-00314 2F

Porosity and Permeability of the Paleozoic Rocks in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00315 2F

Using a Geographic Information System to Develop a Ground-Water Flow Model.
W91-00316 2F

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.

W91-00321 2F

Speleological Phenomena of Dinaric Karst.
W91-00322 2F

Karst Poljes in Dinarides.
W91-00323 2F

Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

Problems of Sea Water Intrusion into Aquifers of the Coastal Dinaric Karst.
W91-00325 2F

Application of Geophysical Methods to Hydrogeological Problems in Dinaric Karst of Yugoslavia.
W91-00326 7B

Some Methods of Hydrogeologic Exploration and Water Regulation in the Dinaric Karst with Special Reference to Their Application in Eastern Herzegovina.
W91-00327 2F

Hydrogeologic Features of Typical Karst Terrains in Montenegro.
W91-00328 2F

Hydrogeological Features of Some Northern Dalmatia Littoral Karst Parts, Lika and Croatian Littoral.
W91-00329 2F

Hydrogeologic Features of Some Karst Parts of Slovenia.
W91-00330 2F

Geohydrology and Regional Ground-Water Flow of the Coastal Lowlands Aquifer System in Parts of Louisiana, Mississippi, Alabama, and Florida--A Preliminary Analysis.
W91-00332 2F

Hydrogeology and Ground-Water-Quality Conditions at the Geary County Landfill, Northeast Kansas, 1988.
W91-00338 5B

Hydrogeology and Simulation of Ground-Water Flow at Superfund-Site Wells G and H, Woburn, Massachusetts.
W91-00340 2F

Geohydrologic Aspects for Siting and Design of Low-Level Radioactive-Waste Disposal.
W91-00347 5E

Geohydrology and Simulated Effects of Pumpage on the New Orleans Aquifer System at New Orleans, Louisiana.
W91-00348 2F

Ground-Water Hydrology of the Central Raton Basin, Colorado and New Mexico.
W91-00349 2F

Analysis of Geophysical Well Logs and Flowmeter Measurements in Boreholes Penetrating Subhorizontal Fracture Zones, Lac Du Bonnet Batholith, Manitoba, Canada.
W91-00354 2F

Remote Data Collection and Control for Hydrogeologic Monitoring.
W91-00370 7B

Ground-Water Conditions in Las Vegas Valley, Clark County, Nevada. Part 1: Hydrogeologic Framework.
W91-00429 2F

Hydrogeology and Water Quality of Significant Sand and Gravel Aquifers in Parts of Aroostook County, Maine: Significant Sand and Gravel Aquifer Maps 75, 76, 77, 78, 84, and 85.
W91-00435 2F

Hydrogeologic and Water-Quality Data from Well Clusters Near the Wastewater-Treatment Plant, U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-00438 5B

Hydrogeologic Investigations Sampling Plan.
W91-00557 7A

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 1. Theory.
W91-00601 2F

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 2. Application to Owens Valley, California.
W91-00602 2F

Hydrogeochemistry of Lake Gallocanta (Aragon, NE Spain).
W91-00740 2H

Some Characteristics of Springs in High Elevation Alteritic Material: Their Contribution to the Understanding of the Intricacy of the Two-Layered 'Sand-Basement' Aquifer (Madagascar High Plateaux) (Caracteristiques d'Emergences en Milieu Alteritique d'Altitude: Leur Apport a la Comprehension de l'Aquifere Bicouche Arenes-socle (Hauts Plateaux de Madagascar)).
W91-00856 2F

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.
W91-00864 2G

Effects of Faults on Fluid Flow and Chloride Contamination in a Carbonate Aquifer System.
W91-00877 2F

Theory and Application of an Approximate Model of Saltwater Upconing in Aquifers.
W91-00883 2F

Hydrology of the Karst Aquifer at the Experimental Site of Guilin in Southern China.
W91-00891 2F

GEOLOGIC FORMATIONS

Karst Poljes in Dinarides.
W91-00323 2F

Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

GEOLOGIC FRACTURES
Analysis of Pumping Test Data from Borewells in Fractured Rocks of Karnataka.
W91-00217 2F

Critical Evaluation of Pumping Test Data from Fractured Crystalline Formation.
W91-00219 2F

Joint System Analysis for the Evaluation of Flow in Fractured Aquifer.
W91-00228 7C

Borehole Geophysical Logging Techniques for Delineating Fractured Zones and Cavities in Hard Rock Areas for Hydrofracturing: A Case Study.
W91-00241 2F

Analysis of Geophysical Well Logs and Flowmeter Measurements in Boreholes Penetrating Subhorizontal Fracture Zones, Lac Du Bonnet Batholith, Manitoba, Canada.
W91-00354 2F

Mathematical Modeling of Tracer Behavior in Short-Term Experiments in Fissured Rocks.
W91-00598 5B

GEOLOGIC UNITS
Approach in Determination of Aquifer Geometry and Estimation of Aquifer Parameters of an Areally Extensive Upper Kamthi Sandstone Aquifer in Parts of Godavari Valley, Andhra Pradesh.
W91-00231 2F

GEOLOGY
Joint System Analysis for the Evaluation of Flow in Fractured Aquifer.
W91-00228 7C

Integrated Geological and Geophysical Investigations for Delineating Karstic Zones in Carbonate Formations of Anantapur District, A.P., India.
W91-00239 2F

Professional Registration for Geologists and Engineering Geologists.
W91-00270 6E

Karst Poljes in Dinarides.
W91-00323 2F

Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

GEOMORPHOLOGY
Geomorphological Effects of Catastrophic Flooding on a Small Subtropical Estuary.
W91-00049 2J

Experimental Study of Complex Response in River Channel Adjustment Downstream from a Reservoir.
W91-00050 2J

Stream-Channel Incision Following Drainage-Basin Urbanization.
W91-00082 4C

Geomorphic Design and Management of Disturbed Lands.
W91-00296 4C

Speleological Phenomena of Dinaric Karst.
W91-00322 2F

Karst Poljes in Dinarides.
W91-00323 2F

Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

Significance of Sediment Transport in Arroyo Development.
W91-00346 2J

Topographic Effects on Flow Path and Surface Water Chemistry of the Llyn Brianne Catchments in Wales.
W91-00888 2E

Review of the Search for a Quantitative Link Between Hydrologic Response and Fluvial Geomorphology.
W91-00977 2E

Geomorphoclimatic Derivation of Flood Frequency (Peak and Volume) at the Basin and Regional Scale.
W91-00978 2E

GEOPHYSICAL METHODS
Application of Geophysical Methods to Hydrogeological Problems in Dinaric Karst of Yugoslavia.
W91-00326 7B

GEOPHYSICAL SURVEYS
Spatially Continuous Determination of Groundwater Flow to Surface Water Bodies: Application to the Connecting Channels Between Lakes Huron and Erie.
W91-00163 2A

Investigations of Groundwater Resources at Selected Levels in Droughtprone Area of Pahari Block, District Mirzapur, U.P., India.
W91-00237 2F

More Accurate Determination of Aquifer Parameters Using the IP Sounding Method.
W91-00238 7B

Integrated Geological and Geophysical Investigations for Delineating Karstic Zones in Carbonate Formations of Anantapur District, A.P., India.
W91-00239 2F

Hydrogeophysical Studies for Characterizing the Crystalline Aquifers of Tambraparni Basin, Tamil Nadu, India.
W91-00242 2F

Radial Vertical Electrical Soundings: A Case Study in Groundwater Exploration.
W91-00246 2F

Deep Geoelectrical Soundings and Shapes of Curves Used for Recommendations of Bore Sites in Basaltic Terrain.
W91-00247 7B

Description of Lineaments Found in Kalavad Taluka of Jamnagar District and Drilling Drilled for Water Supply.
W91-00248 2F

Brisk Ground Water Investigation for Locating Bore Hole Site is Basaltic Terrain.
W91-00249 2F

Electrical Resistivity Survey for Ground Water in Varaha River Basin, A.P., India.
W91-00251 2F

Soil Moisture Studies in Soils of Delhi Territory Using the Resistivity Meter.
W91-00258 2G

Geophysically Determined Porosity of Paleozoic Rocks in the Upper Colorado River Basin.
W91-00314 2F

Application of Geophysical Methods to Hydrogeological Problems in Dinaric Karst of Yugoslavia.
W91-00326 7B

Some Methods of Hydrogeologic Exploration and Water Regulation in the Dinaric Karst with Special Reference to Their Application in Eastern Herzegovina.
W91-00327 2F

GEOPHYSICS
Integrated Geological and Geophysical Investigations for Delineating Karstic Zones in Carbonate Formations of Anantapur District, A.P., India.
W91-00239 2F

Borehole Geophysical Logging Techniques for Delineating Fractured Zones and Cavities in Hard Rock Areas for Hydrofracturing: A Case Study.
W91-00241 2F

Hydrogeophysical Studies for Characterizing the Crystalline Aquifers of Tambraparni Basin, Tamil Nadu, India.
W91-00242 2F

GEORGIA
Ground-Water Data for Georgia, 1988.
W91-00432 2F

Macrofauna Distributions and Sediment Analyses from the Brunswick, Georgia Ocean Dredged Material Disposal Site and Environs.
W91-00444 5E

Isolation of Dissolved Organic Matter from the Suwannee River Using Reverse Osmosis.
W91-00816 5B

Effects of Faults on Fluid Flow and Chloride Contamination in a Carbonate Aquifer System.
W91-00877 2F

GERMANY
Fate of Aquatic and Wetland Habitats in an Industrially Contaminated Section of the Elbe Floodplain in Hamburg.
W91-00648 5B

Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

Seasonal Variation in the Structure of the Microbial Community Capable of Nitrate Respiration in an Intertidal Mud Flat Sediment from the Elbe Estuary.
W91-00650 2L

Potential Bio-available Phosphorus in Sediments of the River Elbe in Northern Germany.
W91-00651 2L

Studies on the Algae of a Small Softwater Stream I. Occurrence and Distribution with Particular Reference to the Diatoms.
W91-00869 2H

GHANA BIRD SANCTUARY
Role of Ground Water in Controlling Ecology of Area: A Case Study of Ghana Bird Sanctuary - District Bharatpur, Rajasthan.
W91-00234 6G

GIARDIA
Efficacy of a Small-Quantity Water Treatment Method for Inactivating Giardia Cysts in Raw Water.
W91-00637 5F

GILLS
Gill Lesions in the Perch, Anabas testudineus, Subjected to Sewage Toxicity.
W91-00205 5C

GLACIAL AQUIFERS
Hydrogeology and Water Quality of Significant Sand and Gravel Aquifers in Parts of Aroostook County, Maine: Significant Sand and Gravel Aquifer Maps 75, 76, 77, 78, 84, and 85.
W91-00435 2F

GLACIERS
Global Water Balance and Global Climate Model in the Pleistocene.
W91-00459 2C

Satellite Determination of Coast Range, Alaskan Glacier Mass Balance Related to Atmospheric Circulation.
W91-00468 2C

GLOBAL WARMING
Potential Coastal Impacts of Contemporary Changing Climate on South Asian Seas States.
W91-00027 4C

Empirical Data on Contemporary Global Climate Changes (Temperature and Precipitation).
W91-00146 2B

Climatic Change in Sunderland.
W91-00190 2B

Effects of Climate Change on Snowmelt Runoff Patterns.
W91-00458 2C

Evaluation and Prediction of Possible Man-Induced Changes in the Hydrological Cycle.
W91-00967 4C

Development and Application of Simple Water Balance Models to Understand the Relationship Between Climate and Water Resources.
W91-00995 2A

GLUCOSE
Growth of Biopellets on Glucose in Upflow Anaerobic Sludge Bed (UASB) Systems.
W91-00631 5D

Effect of Nitrogen Limitation on Pelletisation in Upflow Anaerobic Sludge Bed Systems.
W91-00632 5D

GLUTATHIONE
Importance of Glutathione in the In Vitro Detoxification of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone, an Important Mutagenic By-Product of Water Chlorination.
W91-00489 5B

GOCZALKOWICE RESERVOIR
Development and Structure of the Goczalkowice Reservoir Ecosystem. XIX. Suspended-Matter Sedimentation.
W91-00005 2H

Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

GOLD
Determination of Gold at Femtomolar Levels in Natural Waters by Flow Injection Inductively Coupled Plasma Quadrupole Mass Spectrometry.
W91-00388 2K

GOVERNMENTAL INTERRELATIONS
Opportunities for Reservoir-storage Reallocation.
W91-00186 6E

GRANULAR ACTIVATED CARBON
Adsorption Removal of Cresol by Granular Activated Carbon for Medical Waste Water Treatment.
W91-00203 5D

Removal of DBCP (1,2-Dibromo-3-chloropropane) from Groundwater. Volume 1. POE/POU (Point of Entry/Point of Use) Treatment Devices Institutional and Jurisdictional Factors.
W91-00558 5F

Comparison of Media Types in Acetate Fed Expanded-Bed Anaerobic Reactors.
W91-00806 5D

GRANULAR BED FILTRATION
Experimental Investigation of Size Distribution of Suspended Particles in Granular Bed Filtration.
W91-00819 5F

GRAPHICAL ANALYSIS
Robust Graphical Methods for Diagnosing Trend in Irregularly Spaced Water Quality Time Series.
W91-00138 5B

GRAPHICAL METHODS
Robust Graphical Methods for Diagnosing Trend in Irregularly Spaced Water Quality Time Series.
W91-00138 5B

GRASSES
Effects of Nutrients and Water Levels on Species Composition in Prairie Whitetop (Scolochloa festucacea) Marshes.
W91-00674 2H

GRAVEL
Water Temperature in a Stream Gravel Bed and Implications for Salmonid Incubation.
W91-00427 8I

GRAVITY DAMS
Three-Dimensional Boundary Element Reservoir Model for Seismic Analysis of Arch and Gravity Dams.
W91-00123 8D

GREAT LAKES
Spatially Continuous Determination of Groundwater Flow to Surface Water Bodies: Application to the Connecting Channels Between Lakes Huron and Erie.
W91-00163 2A

GREAT LAKES NATIONAL PROGRAM
Five Year Program Strategy for the Great Lakes National Program Office, FY 1989-1993.
W91-00552 5G

GREAT SALT LAKE
Changes in Lake Levels, Salinity and the Biological Community of Great Salt Lake (Utah, USA), 1847-1987.
W91-00748 2H

GREECE
Water Masses and Eutrophication in a Greek Anoxic Marine Bay.
W91-00798 5B

Regional Analysis of the Mean Annual Flood and of Flood Frequency Characteristics.
W91-00988 2E

GREENHOUSE EFFECT
Evaluation and Prediction of Possible Man-Induced Changes in the Hydrological Cycle.
W91-00967 4C

GREENLAND
Basis of Hydro-Climatic Time Series in Greenland.
W91-00469 7C

GROUNDWATER
Water Flows Toward Money: The Complicated Story of Reno, Nevada's Water Supply Problems.
W91-00054 6D

Upper Colorado River Basin Regional Aquifer-Systems Analysis: Mesozoic Rocks in Colorado, Utah, and Wyoming, Arizona, and New Mexico.
W91-00308 2F

Hydrostratigraphic Characterization of Paleozoic Formations in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00313 2F

Using a Geographic Information System to Develop a Ground-Water Flow Model.
W91-00316 2F

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

Hydrogeologic Features of the Dinaric Karst.
W91-00321 2F

Hydrogeological Features of Some Northern Dalmatia Littoral Karst Parts, Lika and Croatian Littoral.
W91-00329 2F

Geohydrology and Regional Ground-Water Flow of the Coastal Lowlands Aquifer System in Parts of Louisiana, Mississippi, Alabama, and Florida--A Preliminary Analysis.
W91-00332 2F

Hydrogeology and Simulation of Ground-Water Flow at Superfund-Site Wells G and H, Woburn, Massachusetts.
W91-00340 2F

Statistical Processor for Analyzing Simulations Made Using the Modular Finite-Difference Ground-Water Flow Model.
W91-00353 7C

Analysis of Geophysical Well Logs and Flowmeter Measurements in Boreholes Penetrating Subhorizontal Fracture Zones, Lac Du Bonnet Batholith, Manitoba, Canada.
W91-00354 2F

Graphical Kernel System (GKS) Version of Computer Program MODPATH-PLOT for Displaying Path Lines Generated from the U.S. Geological Survey Three-Dimensional Ground-Water Flow Model.
W91-00361 7C

Subsurface Transport of Inorganic and Organic Solutes from Experimental Road Spreading of Oil-Field Brine.
W91-00365 5B

Remote Data Collection and Control for Hydrogeologic Monitoring.
W91-00370 7B

Exact Solution for Flow of Slightly Compressible Fluids Through Multiple-Porosity, Multiple-Permeability Media.
W91-00588 2F

Mathematical Modeling of Tracer Behavior in Short-Term Experiments in Fissured Rocks.
W91-00598 5B

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 1. Theory.
W91-00601 2F

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 2. Application to Owens Valley, California.
W91-00602 2F

Capillarity Correction for Free Surface Flow Revisited.
W91-00614 4B

Some Characteristics of Springs in High Elevation Alteritic Material: Their Contribution to the Understanding of the Intricacy of the Two-Layered 'Sand-Basement' Aquifer (Madagascar High Plateaux) (Caracteristiques d'Emergences en Milieu Alteritique d'Altitude: Leur Apport a la Comprehension de l'Aquifere Bicouche Arenes-socle (Hauts Plateaux de Madagascar)).
W91-00856 2F

Effects of Faults on Fluid Flow and Chloride Contamination in a Carbonate Aquifer System.
W91-00877 2F

Theory and Application of an Approximate Model of Saltwater Upconing in Aquifers.
W91-00883 2F

Motion of Coastal Groundwater in Response to the Tide.
W91-00884 2F

Relative Performance of a Soil Moisture Accounting Model in Estimating Return Flow.
W91-00887 2G

Using Rn222 to Examine Groundwater/Surface Discharge Interaction in the Rio Grande de Manati, Puerto Rico.
W91-00893 2F

GROUNDWATER POLLUTION

Cascading Water: A Threat to Ground Water Quality.
W91-00053 5B

Measuring Economic Losses from Ground Water Contamination: An Investigation of Household Avoidance Costs.
W91-00086 5C

Water and Nitrogen Management in Central Platte Valley of Nebraska.
W91-00173 3F

Two-stage Ground-water Remediation Design.
W91-00184 5G

What Is a Leacher.
W91-00362 5B

High Water Level Installation of Monitoring Wells for Underground Storage Tanks.
W91-00364 5G

Subsurface Transport of Inorganic and Organic Solutes from Experimental Road Spreading of Oil-Field Brine.
W91-00365 5B

Proposal to Use Chlorine-36 for Monitoring the Movement of Radionuclides from Nuclear Explosions.
W91-00366 5A

Ground Water Recharge and Pollution Potential of Dry Wells in Pima County, Arizona.
W91-00367 5B

Soil-Gas Surveying for Subsurface Gasoline Contamination Using Total Organic Vapor Detection Instruments: Part I. Theory and Laboratory Experimentation.
W91-00368 5A

Research on Agrichemicals in Water Resources.
W91-00417 5B

Hydrogeologic and Water-Quality Data from Well Clusters Near the Wastewater-Treatment Plant, U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-00438 5B

Superfund Record of Decision: French Limited, TX.
W91-00447 5G

Fate and Transport of Petroleum Released from Underground Storage Tanks.
W91-00452 5B

Correlations Between Measurements of Organic Halide and Specific Halogenated Volatile Organic Compounds in Contaminated Groundwater.
W91-00528 5B

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly.
W91-00566 5G

Pesticides in Ground Water Data Base: 1988 Interim Report.
W91-00569 5B

Users Manual for the SLUDGEMAN Model for the Groundwater Pathway in the Monofilling of Sewage Sludge.
W91-00575 5E

Contaminant Dissolution and Diffusional Transport with a Stationary Precipitation Front.
W91-00612 5E

Fluorescent Polycyclic Aromatic Hydrocarbons as Probes for Studying the Impact of Colloids on Pollutant Transport in Groundwater.
W91-00623 5B

Effects of Faults on Fluid Flow and Chloride Contamination in a Carbonate Aquifer System.
W91-00877 2F

GROUNDWATER POTENTIAL

Ground-Water Hydrology of the Central Raton Basin, Colorado and New Mexico.
W91-00349 2F

Ground-Water Resources of the Arkansas River Basin in Arkansas.
W91-00355 2F

Water Water Everywhere . . . Have You Looked.
W91-00412 2F

GROUNDWATER PROTECTION

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly.
W91-00566 5G

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly, Appendix 2 - Written Comments.
W91-00567 5G

GROUNDWATER QUALITY

Cascading Water: A Threat to Ground Water Quality.
W91-00053 5B

Evaluation of Hydrogeochemical Parameters with Spontaneous Potential Logs.
W91-00157 7B

Hydrochemical Characterization of Groundwater Mixing in Sedimentary and Metamorphic Reservoirs with Combined Use of Piper's Principle and Factor Analysis.
W91-00164 2K

Environmental Isotope-Aided Studies on Water Resources in the Region of Cheju Island.
W91-00224 2F

GROUNDWATER QUALITY

Hydrogeology and Ground-Water-Quality Conditions at the Geary County Landfill, Northeast Kansas, 1988.
W91-00338 5B

Availability and Historical Development of Ground-Water Resources of Long Island, New York--An Introduction.
W91-00345 2F

Ground-Water Data for Georgia, 1988.
W91-00432 2F

Hydrogeologic and Water-Quality Data from Well Clusters Near the Wastewater-Treatment Plant, U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-00438 5B

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly.
W91-00566 5G

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly, Appendix 2 - Written Comments.
W91-00567 5G

Mathematical Modelling of Sea Water Intrusion, Nauru Island.
W91-00865 2L

Geostatistical Methods for Detection of Outliers in Groundwater Quality Spatial Fields.
W91-00894 2F

GROUNDWATER RECHARGE

Estimating Groundwater Recharge Using a Surface Watershed Modelling Approach.
W91-00160 2F

Estimating Groundwater Recharge Using a Surface Watershed Model: Sensitivity Analyses.
W91-00161 7C

Hydrochemical Characterization of Groundwater Mixing in Sedimentary and Metamorphic Reservoirs with Combined Use of Piper's Principle and Factor Analysis.
W91-00164 2K

Groundwater Recharge Estimation by Tritium Tracer Technique in Sathupally Area, Andhra Pradesh, India.
W91-00225 2F

Environmental Chloride Method for Groundwater Recharge Studies: Potentialities and Limitations.
W91-00226 2F

Use of Single Well Dilution Technique for Seepage Measurements from Canals Using Radio-Active Tracer.
W91-00230 2F

Environmental Isotope-Aided Study on River Water and Groundwater Interaction in the Region of Seoul and Taegu.
W91-00257 2A

Estimation of Recharge and Pollutant Transfer to Groundwater by Modelling of Unsaturated Zone.
W91-00259 2F

Ground Water Management in the South Platte Basin of Colorado.
W91-00413 4B

Groundwater Recharge with Reclaimed Water in California.
W91-00800 4B

Water Banking Through Artificial Recharge, Las Vegas Valley, Clark County, Nevada.
W91-00880 4B

Relative Performance of a Soil Moisture Accounting Model in Estimating Return Flow.
W91-00887 2G

GROUNDWATER RESOURCES

Rural Water Supply Investigations in Scarcity Villages in Bhandara District, Maharashtra.
W91-00222 7B

Environmental Isotope-Aided Studies on Water Resources in the Region of Cheju Island.
W91-00224 2F

Specific Yield Estimations by Radio-Active Tracer in Indo-Gangetic Plain.
W91-00227 2F

Management and Conservation of Ground Water Resource Through Point Dilution Technique Using Radiotracer - Some Case Histories.
W91-00229 4B

Aquifer Parameter Estimation and Groundwater Potentiality in Granite-Basalt Terrain Near Hyderabad, India.
W91-00233 2F

Instrumentation and Technique of Groundwater Exploration (With Nature of Aquifer) in Unconsolidated Sediments (Gangetic Plains) of Uttar Pradesh, Northern India.
W91-00235 2F

Investigations of Groundwater Resources at Selected Levels in Droughtprone Area of Pahari Block, District Mirzapur, U.P., India.
W91-00237 2F

Borehole Geophysical Logging Techniques for Delineating Fractured Zones and Cavities in Hard Rock Areas for Hydrofracturing: A Case Study.
W91-00241 2F

Hydrogeophysical Studies for Characterizing the Crystalline Aquifers of Tambraparni Basin, Tamil Nadu, India.
W91-00242 2F

Deciphering Groundwater Using Remote Sensing Techniques.
W91-00243 7B

Prospecting Groundwater in Pushkar Lake Region Through Remote Sensing - A Case Study.
W91-00244 7B

Kriged Estimates of Water-Levels from the Sparse Measurements in a Hard Rock Aquifer.
W91-00245 2F

Radial Vertical Electrical Soundings: A Case Study in Groundwater Exploration.
W91-00246 2F

Description of Lineaments Found in Kalavad Taluka of Jamnagar District and Drilling Drilled for Water Supply.
W91-00248 2F

Brisk Ground Water Investigation for Locating Bore Hole Site is Basaltic Terrain.
W91-00249 2F

Fracture Pattern Modelling for Groundwater Targetting in Hard Rock Terrain: A Study Aided by Remote Sensing Technique.
W91-00250 7C

Electrical Resistivity Survey for Ground Water in Varaha River Basin, A.P., India.
W91-00251 2F

Digital Enhancement of Surface Geologic Features in a Part of Banas River Catchment for Ground Water Potential Characterization.
W91-00252 7C

Remote Sensing Based Appropriate Methodology for the Groundwater Exploration: A Case Study from Pre-Cambrians of South India.
W91-00254 7C

Moisture Variation Study by Neutron-Neutron Logging.
W91-00255 7C

Interactive Groundwater Database System.
W91-00263 7C

Upper Colorado River Basin Regional Aquifer-Systems Analysis: Mesozoic Rocks in Colorado, Utah, and Wyoming, Arizona, and New Mexico.
W91-00308 2F

Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Lithologic and Hydrologic Properties of Mesozoic Rocks in the Upper Colorado River Basin.
W91-00310 2F

Hydrology of the Navajo Sandstone in Southeastern and Southern Utah.
W91-00311 2F

Geophysically Determined Porosity of Paleozoic Rocks in the Upper Colorado River Basin.
W91-00314 2F

Hydrogeologic Features of Some Karst Parts of Slovenia.
W91-00330 2F

Ground-Water Resources of the Arkansas River Basin in Arkansas.
W91-00355 2F

Ground-Water Data for Michigan 1988.
W91-00358 2F

Water Water Everywhere . . . Have You Looked.
W91-00412 2F

Ground-Water Conditions in Las Vegas Valley, Clark County, Nevada. Part 1: Hydrogeologic Framework.
W91-00429 2F

Hydrogeology and Water Quality of Significant Sand and Gravel Aquifers in Parts of Aroostook County, Maine: Significant Sand and Gravel Aquifer Maps 75, 76, 77, 78, 84, and 85.
W91-00435 2F

GROUNDWATER YIELD

Role of Hydrogeological Set Up in the Yield of Wells in Granite Terrain: Case Histories of Nizamabad, Warangal and Hindupur Areas.
W91-00253 2F

GROWTH

Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

Estimating the Carrying Capacity of a Coastal Inlet for Mussel Culture.
W91-00666 2L

GROWTH MEDIA

Vegetative Growth of Spirodela polyrrhiza as Affected by Medium Concentration, Daylight Intensity and Age.
W91-00684 2H

GROWTH RATES

Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus

fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

HABITATS
Variability of Results From the Use of PHABSIM in Estimating Habitat Area.
W91-00775 7C

HAIFA BAY
Determination of the Environmental Capacity of Haifa Bay with Respect to the Input of Mercury.
W91-00706 5B

HAIL
Differential Reflectivity Radar Hail Measurement Technique: Observations During the Denver Hailstorm of 13 June 1984.
W91-00140 2C

HALAMINES
New Halamine Water Disinfectants.
W91-00547 5F

HALIDES
Organic Halide Formation During Water Treatment Under Free Chlorine Versus Chloramination Conditions.
W91-00522 5B

Correlations Between Measurements of Organic Halide and Specific Halogenated Volatile Organic Compounds in Contaminated Groundwater.
W91-00528 5B

HALITE
Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

HALOGENATED HYDROCARBONS
Gas-Phase and Activated Carbon Mediated Thermal Hydrogenolysis of Halogenated Organics.
W91-00395 5D

HANDBOOKS
Standard Handbook of Hazardous Waste Treatment and Disposal.
W91-00900 5D

HAZARD ASSESSMENT
Environmental Risk-Assessment and Audit Principles.
W91-00909 5E

HAZARD WASTE RESEARCH AND INFORMATION C
Enhancement of the HWRIC Database, Year 2. With an Evaluation of Database Content.
W91-00571 7C

HAZARDOUS MATERIALS
Summary of CERCLA Legislation and Regulations and the EPA Superfund Program.
W91-00903 6E

Underground Storage Tanks.
W91-00904 5G

Quantities and Sources of Hazardous Wastes.
W91-00905 5E

Hazardous-Waste Management Capacity.
W91-00906 5E

Health Effects of Hazardous Waste.
W91-00908 5C

Case Study of a Successful Facility Siting.
W91-00910 5E

Hydrolysis.
W91-00915 5D

Ion Exchange.
W91-00916 5D

Solvent Extraction.
W91-00917 5D

Air Stripping and Steam Stripping.
W91-00919 5D

Thin-Film Evaporation.
W91-00920 5D

Freeze-Crystallization.
W91-00921 5D

Sampling and Analysis of Hazardous Wastes.
W91-00958 5A

HAZARDOUS WASTE DISPOSAL
Geohydrologic Aspects for Siting and Design of Low-Level Radioactive-Waste Disposal.
W91-00347 5E

Standard Handbook of Hazardous Waste Treatment and Disposal.
W91-00900 5D

Hazardous-Waste Treatment Comes of Age.
W91-00901 5G

Summary of Resource Conservation and Recovery Act Legislation and Regulation.
W91-00902 6E

Hazardous-Waste Management Capacity.
W91-00906 5E

Siting of Hazardous-Waste Facilities.
W91-00907 5E

Health Effects of Hazardous Waste.
W91-00908 5C

Case Study of a Successful Facility Siting.

Siting of Hazardous-Waste Facilities.
W91-00907 5E

Sampling and Analysis of Hazardous Wastes.
W91-00958 5A

Control and Disposal Indices for Comparing Waste-Management Alternatives.
W91-00959 5E

Cost Perspectives for Hazardous-Waste Management.
W91-00960 5E

HEAD LOSS

Energy Head Implications of the Installation of Circular Flap Gates on Drainage Outfalls.
W91-00068 8C

HEAT TRANSFER

Targeted Chlorination Schedules and Effects on Heat Transfer.
W91-00520 5F

HEAT TREATMENT

Mobile Thermal Treatment Systems.
W91-00941 5D

HEAVY METALS

Aspects of Carbon Metabolism in the Recovery of Selenastrum capricornutum Populations Exposed to Cadmium.
W91-00191 5C

Reproductive Strategy of Daphnia magna Affects the Sensitivity of Its Progeny in Acute Toxicity Tests.
W91-00192 5A

Heavy Metal Contamination in the River Toad, Bufo juxtasper (Inger), Near a Copper Mine in East Malaysia.
W91-00209 5B

Seasonal Changes in the Testes of Fish Puntius ticto, and Their Relation to Heavy Metal Toxicity.
W91-00211 5C

Bioaccumulation of Mercury and Its Effect on Protein Metabolism of the Water Hyacinth Weevil Neochetina eichhornae (Warner).
W91-00212 5C

Gonadal Histopathology Following Nickel Intoxication in the Giant Gaurami Colisa fasciatus (Bloch and Schneider), a Freshwater Tropical Perch.
W91-00213 5C

Effect of Cadmium on Blood of Tilapia, Oreochromis mossambicus (Peters), During Prolonged Exposure.
W91-00214 5C

Metal Dispersal in the Fluvial System of the River Geul: The Role of Discharge, Distance to the Source, and Floodplain Geometry.
W91-00286 5B

Automated Preconcentration of Trace Metals from Seawater and Freshwater.
W91-00615 7B

Identification of Solubility-Controlling Solid Phases in a Large Fly Ash Field Lysimeter.
W91-00621 5B

Lead Poisoning in Magpie Geese Anseranus semipalmata from Ingested Lead Pellet at Bool Lagoon Game Reserve (South Australia).
W91-00687 5C

Resistance to Antibiotics and Heavy Metals of Pseudomonas aeruginosa Isolated from Natural Waters.
W91-00698 5C

Heavy Metals Distribution and Enrichment in the Sediments of Southern East Coast of India.
W91-00701 5B

Impact of Heavy Metals on the Primary Production.
W91-00713 5C

Mechanism of Toxicity of Zinc to the Marine Diatom Nitzschia closterium.
W91-00729 5C

Metal Concentrations in Surficial Sediments from Hypersaline Lakes, Australia.
W91-00737 2K

Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

Implications of Heavy Metal Toxicity Related to EDTA Exposure.
W91-00792 5C

Distribution and Transport of Sediment-Bound Metal Contaminants in the Rio Grande de Tarcoles, Costa Rica (Central America).
W91-00804 5A

Wet and Dry Deposition Fluxes Above the North Sea.
W91-00845 2B

Release of Heavy Metals from Snowpacks on the Japan Sea Side of Japan.
W91-00858 5B

Electrolytic Recovery Techniques.
W91-00914 5D

HERBICIDES

Role of Sediment in Metolachlor Transport from Agricultural Fields.
W91-00282 5B

Use of Membrane Extraction Disks for On-Line Trace Enrichment of Organic Compounds from Aqueous Samples.
W91-00839 5A

HERBIVORES

Effect of Water Depth and Clipping Frequency on the Growth and Survival of Four Wetland Plant Species.
W91-00836 2J

HETEROTROPHIC BACTERIA

Effect of H2S on Heterotrophic Substrate Uptake, Extracellular Enzyme Activity and Growth of Brackish Water Bacteria.
W91-00730 2L

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY

Determination of Chloroaniline Traces in Environmental Waters by Selective Extraction with Two Traps in Tandem and Liquid Chromatography.
W91-00389 5A

Automated High-Performance Liquid Chromatography for the Determination of Pesticides in Water Using Solid Phase Extraction.
W91-00390 5A

Determination of Warfarin in Drinking Water by High-Performance Liquid Chromatography after Solid-Phase Extraction.
W91-00723 5A

Determination of Fungistatic Quaternary Ammonium Compounds in Beverages and Water Samples by High-Performance Liquid Chromatography.
W91-00724 5A

Determination of Borate at Trace Levels in Environmental Samples by Ion-Exclusion Chromatography.
W91-00725 5A

Simultaneous Determination of Nitrites, Nitrates and Amines by Ion-Interaction Reversed-Phase High-Performance Liquid Chromatography.
W91-00728 5A

HIGHWAY EFFECTS

Evaluation of Trout Passage Through Six Highway Culverts in Montana.
W91-00012 8I

HIGHWAY RELOCATION

Channel and Bank Stability of Osborne Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00437 2J

Channel and Bank Stability of Twentymile Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00439 2J

HINDUPUR

Role of Hydrogeological Set Up in the Yield of Wells in Granite Terrain: Case Histories of Nizamabad, Warangal and Hindupur Areas.
W91-00253 2F

HISTOLOGY
Gill Lesions in the Perch, Anabas testudineus, Subjected to Sewage Toxicity.
W91-00205 5C

HISTORIC FLOODS
Geomorphological Effects of Catastrophic Flooding on a Small Subtropical Estuary.
W91-00049 2J

Nonparametric Flood-frequency Analysis with Historical Information.
W91-00152 2E

Palaeoflood Hydrology: A Tool for South Africa--An Example from the Crocodile River near Brits, Transvaal, South Africa.
W91-00636 2E

HISTORY
Hydrology Past and Present.
W91-00066 2A

Present and Future Perspectives of Water Resources in Developed Countries.
W91-00067 6A

Spring Break-Up in Northern Canada Past and Present.
W91-00116 2C

HOJE RIVER
Transport and Sedimentation of Pollutants in a River Reach: A Chemical Mass Balance Approach.
W91-00600 5B

HOSPITALS
Adsorption Removal of Cresol by Granular Activated Carbon for Medical Waste Water Treatment.
W91-00203 5D

HOUSTON
Microtunneling Techniques Aid Sewer Installation.
W91-00773 8A

HUDSON RIVER
Patterns of Fish Spawning in Hudson River Tributaries: Response to an Urban Gradient.
W91-00617 8I

HUMAN DISEASES
Human Activities Leading to Contact with Water in a Schistosomiasis Endemic Area, Southwest Saudi Arabia: Preliminary Observations.
W91-00678 5C

Detection of Vibrio cholerae O1 in the Aquatic Environment by Fluorescent-Monoclonal Antibody and Culture Methods.
W91-00828 5A

HUMAN PHYSIOLOGY
Effects of Drinking Water Chlorine on Human Lipid and Thyroid Metabolism.
W91-00499 5C

Serum Lipid Levels in Neighboring Communities with Chlorinated and Nonchlorinated Drinking Water.
W91-00510 5C

HUMAN POPULATION
Water Supply in Fast-Growing Cities: Tokyo, Japan.
W91-00021 6D

Pilot Studies for Designs of Surveys of Human Disturbance of Intertidal Habitats in New South Wales.
W91-00685 4C

HUMIC ACIDS
Trihalomethane Formation Potential and Organic Content: A New Analytical Approach.
W91-00524 5F

HUMIC SUBSTANCES
Effect of Humic Substances on the Toxicity of Aluminum to Adult Rainbow Trout, Oncorhynchus mykiss (Walbaum).
W91-00371 5C

Comparison of Mutagenic Activity of Chlorinated Aquatic and Commercial Humic Substances.
W91-00488 5C

Isolation of Dissolved Organic Matter from the Suwannee River Using Reverse Osmosis.
W91-00816 5B

HUMID CLIMATES
Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

HUNGARY
Monitoring of Weather Conditions on Mesoscale to Improve a Precipitation Warning System for Hydrologic Purposes.
W91-00467 7B

HYDRANTS
Accuracy of Hydrant Flow Tests Using a Pitot Diffuser.
W91-00378 7B

HYDRAULIC CONDUCTIVITY
Investigating Septic Disposal Sites Using a Velocity Permeameter.
W91-00394 5D

HYDRAULIC DESIGN
Single-Outlet Detention-Pond Analysis and Design.
W91-00171 8A

HYDRAULIC ENGINEERING
Bridges and Culverts Reduced in Size and Cost by Use of Critical Flow Transitions.
W91-00100 8B

Siphon Quenches.
W91-00142 8A

Menu of Coupled Velocity and Sediment-discharge Relations for Rivers.
W91-00149 2J

Explicit Methods for 2-D Transient Free-surface Flows.
W91-00151 2E

Vortex Drop Inlet for Supercritical Approaching Flow.
W91-00153 8A

Design of Stable Alluvial Channels.
W91-00154 2J

Model of Flow in Regulated Open-channel Networks.
W91-00172 2E

Improvement of Bypassing and Backpassing at Tidal Inlets.
W91-00178 8A

Risk of Debris-basin Failure.
W91-00181 8A

HYDRAULIC GATES
Energy Head Implications of the Installation of Circular Flap Gates on Drainage Outfalls.
W91-00068 8C

HYDRAULIC GEOMETRY
Local Scour Profiles Downstream of Hydraulic Jump.
W91-00032 8B

Hydraulic Jumps at Positive and Negative Steps.
W91-00034 8B

Wave Type Flow at Abrupt Drops.
W91-00042 2E

HYDRAULIC JUMP
Local Scour Profiles Downstream of Hydraulic Jump.
W91-00032 8B

Hydraulic Jumps at Positive and Negative Steps.
W91-00034 8B

Wave Type Flow at Abrupt Drops.
W91-00042 2E

Catastrophe Model for the Forced Hydraulic Jump.
W91-00373 8B

HYDRAULIC MACHINERY
Energy Head Implications of the Installation of Circular Flap Gates on Drainage Outfalls.
W91-00068 8C

HYDRAULIC MODELS
Local Scour Profiles Downstream of Hydraulic Jump.
W91-00032 8B

Turbulence Measurements in a Shear Layer Region of a Compound Channel.
W91-00039 8B

SERC Flood Channel Facility: Skewed Flow Experiments.
W91-00040 8B

Three-Dimensional Scale Model of Ground-Water Solute Transport.
W91-00064 5B

Comprehensive Generalized Study of Scour at Cantilevered Pipe Outlets.
W91-00072 8B

Drip Irrigation Nonlinear Optimization Model.
W91-00168 3F

Catastrophe Model for the Forced Hydraulic Jump.
W91-00373 8B

Inviscid Dam-Break Solution.
W91-00376 8B

Transient Analysis of Water Distribution Systems.
W91-00379 5F

Discharge characteristics of Local Discontinuous Contractions, II.
W91-00762 8B

Assessing Options for Stream Regulation Using Hydrologic Simulations and Cumulative Impact Analysis: Flathead River Basin, USA.
W91-00779 2E

HYDRAULIC ROUGHNESS
Guide for Selecting Manning's Roughness Coefficients for Natural Channels and Flood Plains.
W91-00335 2E

HYDRAULIC STRUCTURES
Energy Head Implications of the Installation of Circular Flap Gates on Drainage Outfalls.
W91-00068 8C

Dimensionless Analytical Solutions for Dam-Breach Erosion.
W91-00069 8A

Vortex Drop Inlet for Supercritical Approaching Flow.
W91-00153 8A

Improvement of Bypassing and Backpassing at Tidal Inlets.
W91-00178 8A

HYDRAULIC SYSTEMS
Modified Element Method for Pipe Network Analysis.
W91-00398 8B

HYDRAULIC TRANSIENTS
Transient Analysis of Water Distribution Systems.
W91-00379 5F

HYDRAULIC TURBINES
Analysis of Scale Effects on Performance Characteristics of Hydraulic Turbines: Part 2: Effects of Surface Roughness, Runner Seal Clearance and Reynolds Number on Performance and Loss Distribution Coefficients.
W91-00098 8G

HYDRAULICS
Mathematical Modelling of the Effect of Size Distribution on Suspended Particles in Deep-Bed Filtration.
W91-00022 5F

Algorithm for Routing Unsteady Flows in Urban Drainage Networks.
W91-00031 4C

Improved Method of Calculation for Steady Uniform Flow in Prismatic Main Channel/Flood Plain Sections.
W91-00038 8B

SERC Flood Channel Facility: Skewed Flow Experiments.
W91-00040 8B

Classification of Unidirectional Three-layer Flow Over a Hump.
W91-00041 8B

Wave Type Flow at Abrupt Drops.
W91-00042 2E

Hydrologic and Hydraulic Research in Mountain Rivers.
W91-00083 2E

Analysis of Scale Effects on Performance Characteristics of Hydraulic Turbines: Part 2: Effects of Surface Roughness, Runner Seal Clearance and Reynolds Number on Performance and Loss Distribution Coefficients.
W91-00098 8G

Catastrophe Model for the Forced Hydraulic Jump.
W91-00373 8B

Locating and Identifying Hydraulic Controls for Layered Flow Over an Obstruction.
W91-00374 2L

State Space Approach to the Behavior of Sewer Systems.
W91-00375 5D

Inviscid Dam-Break Solution.
W91-00376 8B

Accuracy of Hydrant Flow Tests Using a Pitot Diffuser.
W91-00378 7B

Transient Analysis of Water Distribution Systems.
W91-00379 5F

HYDROCARBONS
Numerical Model for Areal Migration of Water and Light Hydrocarbon in Unconfined Aquifers.
W91-00120 5B

Crude Oil and Hydrocarbon-degrading Strains of Rhodococcus rhodochrous Isolated from Soil and Marine Environments in Kuwait.
W91-00144 5B

Modeling the Potential Effect of Additives on Enhancing the Solubility of Aromatic Solutes Contained in Gasoline.
W91-00369 5B

Colonization of Amphipods and Polychaetes to Sediments Experimentally Exposed to Oil Hydrocarbons.
W91-00707 5C

HYDRODYNAMICS
Comparison of Two Finite Element Models of Tidal Hydrodynamics Using a North Sea Data Set.
W91-00046 2L

Three-Dimensional Analysis of Pressures on Dams.
W91-00057 8B

Nonlinear Hydrodynamic Pressure on Dams.
W91-00058 8B

Shake Table Test of Cylindrical Water Tanks in Base-Isolated Structures.
W91-00147 8E

HYDROELECTRIC PLANTS
Enhancement of Benthic Macroinvertebrates by Minimum Flow from a Hydroelectric Dam.
W91-00778 6G

HYDROELECTRIC POWER
Improving the Effectiveness of Fisheries Agencies in Developing Hydropower Mitigation.
W91-00008 6E

HYDROFRACTURING
Borehole Geophysical Logging Techniques for Delineating Fractured Zones and Cavities in Hard Rock Areas for Hydrofracturing: A Case Study.
W91-00241 2F

HYDROGEN
Microbiological and Chemical Investigations on a Biological, Autotrophic Denitrification Plant Using Hydrogen as an Energy Source.
W91-00024 5F

HYDROGEN ION CONCENTRATION
Chemical Characterization of Acid Precipitation in Albany, New York.
W91-00850 5A

Release of Heavy Metals from Snowpacks on the Japan Sea Side of Japan.
W91-00858 5B

HYDROGEN PEROXIDE
Atmospheric Chemistry of Peroxides: A Review.
W91-00841 5B

Field Investigations on the Snow Chemistry in Central and Southern California-I. Inorganic Ions and Hydrogen Peroxide.
W91-00842 5B

HYDROGEN SULFIDE
Effect of H2S on Heterotrophic Substrate Uptake, Extracellular Enzyme Activity and Growth of Brackish Water Bacteria.
W91-00730 2L

Hydrogen Sulfide Treatment Systems in Sanitary Sewers.
W91-00769 5D

HYDROGEOCHEMISTRY
Hydrogeochemistry of Lake Gallocanta (Aragon, NE Spain).
W91-00740 2H

HYDROGRAPH ANALYSIS
Floods and Droughts in Labe River Basin: The Hydrograph Shape.
W91-00975 2E

HYDROGRAPHS
Review of the Search for a Quantitative Link Between Hydrologic Response and Fluvial Geomorphology.
W91-00977 2E

HYDROLOGIC BUDGET
Water Balance of Lake Rotoiti, North Island: Floods and Short-Circuiting of Inflows from Lake Rotorua.
W91-00077 2H

Global Water Balance and Global Climate Model in the Pleistocene.
W91-00459 2C

Basis of Hydro-Climatic Time Series in Greenland.
W91-00469 7C

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

Development and Application of Simple Water Balance Models to Understand the Relationship Between Climate and Water Resources.
W91-00995 2A

HYDROLOGIC CYCLE
Evaluation and Prediction of Possible Man-Induced Changes in the Hydrological Cycle.
W91-00967 4C

HYDROLOGIC DATA
Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Cost Effectiveness of the Streamflow-Gaging Program in West Virginia.
W91-00331 2E

Ground-Water Data for Michigan 1988.
W91-00358 2F

Annual Yield and Selected Hydrologic Data for the Arkansas River Basin Compact Arkansas--Oklahoma 1989 Water Year.
W91-00360 2E

Remote Data Collection and Control for Hydrogeologic Monitoring.
W91-00370 7B

Ground-Water Data for Georgia, 1988.
W91-00432 2F

Hydrologic and Chemical-Quality Data from Four Rural Basins in Guilford County, North Carolina, 1985-88.
W91-00433 5B

Hydrologic and Water-Quality Data for Streams and Impoundments in the Coteau des Prairies--Upper Minnesota River Basin, 1979-84.
W91-00434 2E

Hydrogeology and Water Quality of Significant Sand and Gravel Aquifers in Parts of Aroostook County, Maine: Significant Sand and Gravel Aquifer Maps 75, 76, 77, 78, 84, and 85.
W91-00435 2F

Hydrologic and Chemical Data from Selected Wells and Springs in Southern Elmore County, Including Mountain Home Air Force Base, Southwestern Idaho, Fall 1989.
W91-00440 5B

Environmental Geographic Information System in Finland.
W91-01003 7C

HYDROLOGIC DATA COLLECTIONS
Interactive Groundwater Database System.
W91-00263 7C

Acquisition of Hydrogeologic Data for the Mapping of Shallow Unconfined Deccan Basaltic Aquifers from Maharashtra, India.
W91-00266 2F

Frequency Distributions of Heavy Rainstorms in Illinois.
W91-00553 2B

Regional Water Quality: Evaluation of Data for Assessing Conditions and Trends.
W91-00619 7A

HYDROLOGIC MAPS
Acquisition of Hydrogeologic Data for the Mapping of Shallow Unconfined Deccan Basaltic Aquifers from Maharashtra, India.
W91-00266 2F

HYDROLOGIC MODELS
Three-Dimensional Scale Model of Ground-Water Solute Transport.
W91-00064 5B

One-dimensional Interactive Soil-atmosphere Model for Testing Formulations of Surface Hydrology.
W91-00145 2A

Estimating Groundwater Recharge Using a Surface Watershed Modelling Approach.
W91-00160 2F

Estimating Groundwater Recharge Using a Surface Watershed Model: Sensitivity Analyses.
W91-00161 7C

Simulation of Land Use Changes and Impacts on the Water Balance: A Case Study for Belgium.
W91-00162 4C

Evaluation of Three Evapotranspiration Models in Terms of Their Applicability for an Arid Region.
W91-00165 2D

Regional Flow-duration Curves for Ungauged Sites in Massachusetts.
W91-00185 2E

Hydrogeology and Simulation of Ground-Water Flow at Superfund-Site Wells G and H, Woburn, Massachusetts.
W91-00340 2F

Hydrological Effects of Catchment Characteristics and Land Use Changes Determined by Satellite Imagery and GIS.
W91-00472 2A

Non-Linear System to Describe Movements of Water Masses at the LG-2 Reservoir (La Grande, Quebec).
W91-00885 2H

New Directions for Surface Water Modeling.
W91-00961 7C

Study on Short-term Rainfall Prediction by Radar Raingauge.
W91-00962 2B

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

Entropy Based Method for Flood Forecasting.
W91-00972 2E

Assessment of Network Models in Flood Forecasting.
W91-00973 2E

Real-Time Intercomparison of Hydrological Models.
W91-00974 2A

Floods and Droughts in Labe River Basin: The Hydrograph Shape.
W91-00975 2E

Modelling of Hydrological Processes for a Mountainous Basin.
W91-00976 2A

Modeling Snowfall-to-Snowmelt Delay.
W91-00982 2C

Operational Snow Accumulation and Snowmelt Modeling.
W91-00983 2B

Effects of Recharge Systems on Hydrological Information Transfer Along Rivers.
W91-00984 2E

Development and Application of Simple Water Balance Models to Understand the Relationship Between Climate and Water Resources.
W91-00995 2A

Real Time Simulation Model as a Decision Support System for Surface Water Management.
W91-00998 4A

Deriving Stream Parameters for Hydrologic Modeling from Digital Elevation Data.
W91-01000 2E

Intelligent Geographic Information Systems (IGIS) and Surface Water Modeling.
W91-01001 4A

EXSRM, an Expert System for Snowmelt Runoff Model (SRM).
W91-01002 2E

Using GIS to Assess Spatial Variability of SCS Curve Number at the Basin Scale.
W91-01004 2E

HYDROLOGIC PROPERTIES
Lithologic and Hydrologic Properties of Mesozoic Rocks in the Upper Colorado River Basin.
W91-00310 2F

Hydrology of the Navajo Sandstone in Southeastern and Southern Utah.
W91-00311 2F

Hydrostratigraphic Characterization of Paleozoic Formations in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00313 2F

HYDROLOGICAL MODELS
Physics-Based Approach to Stochastic Hydrology of First-Order Drainage Basins.
W91-00968 2E

Review of the Search for a Quantitative Link Between Hydrologic Response and Fluvial Geomorphology.
W91-00977 2E

Regionalization of Model Parameters for a Large Watershed.
W91-00979 2E

Conceptual Model Simulating the Hydrological Processes on a Drainage Basin in a Plain Area.
W91-00981 2E

New Perspectives on Developments in Modeling of Effective Rainfall by Applying the FDTF Method (Nouvelles Perspectives de Developpement dans la Modelisation des Pluies Efficases par Application de la Methode DPFT).
W91-00985 2E

Regional Analysis of the Mean Annual Flood and of Flood Frequency Characteristics.
W91-00988 2E

Assessment of the US Conservation Service Method for Estimating Design Floods.
W91-00989 2E

Droughts and Floods: Their Definition and Modeling.
W91-00992 2E

HYDROLOGY
Hydrology Past and Present.
W91-00066 2A

Present and Future Perspectives of Water Resources in Developed Countries.
W91-00067 6A

New Directions for Surface Water Modeling.
W91-00961 7C

HYDROLYSIS
Chemistry of Bromine Transfer: Disproportionation and Hydrolysis in Bromamine Systems.
W91-00540 2K

Hydrolysis Constants of Chlorine Monoxide and Bromine Chloride in Water.
W91-00542 5B

Hydrolysis.
W91-00915 5D

HYPOCHLORITE
Further Studies of Hypochlorite Ion Pair Chemistry and Disinfection Efficiency.
W91-00531 5F

HYSTERESIS
Modeling Infiltration in Hysteretic Soils.
W91-00118 2G

Hysteresis and Nonlinearity of Discharge-Sediment Relationships in the Atchafalaya and Lower Mississippi Rivers.
W91-00292 2J

ICE
Physical Chemical Properties of Uncharged Water Clusters and One-Dimensional Ice Based on Quantal Calculations.
W91-00667 2C

ICE BREAKUP
Spring Break-Up in Northern Canada Past and Present.
W91-00116 2C

ICE FORMATION
Effect of Toston Dam on Upstream Ice Conditions.
W91-00574 6G

Physical Chemical Properties of Uncharged Water Clusters and One-Dimensional Ice Based on Quantal Calculations.
W91-00667 2C

IDAHO
Selected Quality Assurance Data for Water Samples Collected by the U.S. Geological Survey, Idaho National Engineering Laboratory, Idaho, 1980 to 1988.
W91-00334 7B

Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-00336 5B

Hydrologic and Chemical Data from Selected Wells and Springs in Southern Elmore County, Including Mountain Home Air Force Base, Southwestern Idaho, Fall 1989.
W91-00440 5B

ILLINOIS
Storm Runoff and its Effects on the Water Quality and Bottom-Material Quality of Cedar Creek, West-Central Illinois, 1985-6.
W91-00339 5B

Superfund Record of Decision: Velsicol Chemical Corporation, IL.
W91-00445 5G

Frequency Distributions of Heavy Rainstorms in Illinois.
W91-00553 2B

IMPOUNDMENTS
Surface Impoundments.
W91-00951 5E

IN VITRO TESTS
Importance of Glutathione in the In Vitro Detoxification of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone, an Important Mutagenic By-Product of Water Chlorination.
W91-00489 5B

Biochemical Mechanisms of In Vitro Chloropropanone Toxicity.
W91-00502 5C

Chlorine Dioxide Depresses T3 Uptake and Delays Development of Locomotor Activity in Young Rats.
W91-00504 5C

INCINERATION
Liquid-Injection Incinerators.
W91-00930 5D

Rotary Kilns.
W91-00931 5D

Cement Kilns.
W91-00933 5D

Pyrolysis.
W91-00935 5D

Oceanic Incineration.
W91-00936 5D

Mobile Thermal Treatment Systems.
W91-00941 5D

Catalytic Incineration.
W91-00942 5D

INCUBATION
Water Temperature in a Stream Gravel Bed and Implications for Salmonid Incubation.
W91-00427 8I

INDIA
Ecology of Marine Benthic Dipterans in a Tidal Creek of Hooghly Estuary, Sagar Island, India.
W91-00051 2L

Longshore-Transport Model for South Indian and Sri Lankan Coasts.
W91-00176 2L

Application of Radioactive Tracer Techniques for Determining Groundwater Velocity and Direction.
W91-00223 7B

Groundwater Recharge Estimation by Tritium Tracer Technique in Sathupally Area, Andhra Pradesh, India.
W91-00225 2F

Specific Yield Estimations by Radio-Active Tracer in Indo-Gangetic Plain.
W91-00227 2F

Management and Conservation of Ground Water Resource Through Point Dilution Technique Using Radiotracer - Some Case Histories.
W91-00229 4B

Aquifer Parameter Estimation and Groundwater Potentiality in Granite-Basalt Terrain Near Hyderabad, India.
W91-00233 2F

Role of Ground Water in Controlling Ecology of Area: A Case Study of Ghana Bird Sanctuary - District Bharatpur, Rajasthan.
W91-00234 6G

Investigations of Groundwater Resources at Selected Levels in Droughtprone Area of Pahari Block, District Mirzapur, U.P., India.
W91-00237 2F

Integrated Geological and Geophysical Investigations for Delineating Karstic Zones in Carbonate Formations of Anantapur District, A.P., India.
W91-00239 2F

Hydrogeological Study of Laterite at a Representative Dam Site in Malvan Valley of Konkan Region (Maharashtra-India) Using Seismic Refraction Method.
W91-00240 2F

Hydrogeophysical Studies for Characterizing the Crystalline Aquifers of Tambraparni Basin, Tamil Nadu, India.
W91-00242 2F

Prospecting Groundwater in Pushkar Lake Region Through Remote Sensing - A Case Study.
W91-00244 7B

Description of Lineaments Found in Kalavad Taluka of Jamnagar District and Drilling Drilled for Water Supply.
W91-00248 2F

Brisk Ground Water Investigation for Locating Bore Hole Site is Basaltic Terrain.
W91-00249 2F

Electrical Resistivity Survey for Ground Water in Varaha River Basin, A.P., India.
W91-00251 2F

Role of Hydrogeological Set Up in the Yield of Wells in Granite Terrain: Case Histories of Nizamabad, Warangal and Hindupur Areas.
W91-00253 2F

Moisture Variation Study by Neutron-Neutron Logging.
W91-00255 7C

Soil Moisture Studies in Soils of Delhi Territory Using the Resistivity Meter.
W91-00258 2G

Conjunctive Use for Irrigation Development in Alluvial Regions: Problems, Prospects and Research Issues.
W91-00261 3F

Acquisition of Hydrogeologic Data for the Mapping of Shallow Unconfined Deccan Basaltic Aquifers from Maharashtra, India.
W91-00266 2F

Heavy Metals Distribution and Enrichment in the Sediments of Southern East Coast of India.
W91-00701 5B

Comparative Limnology of Sambhar and Didwana Lakes (Rajasthan, NW India).
W91-00756 2H

Radiometric Studies of Clear Air Attenuation and Atmospheric Water Vapor at 22.235 GHz over Calcutta (Lat. 22 degrees 32 minutes N, Long. 88 degrees 20 minutes E).
W91-00852 2B

INDIAN RESERVATIONS
Water Resources of the White Earth Indian Reservation, Northwestern Minnesota.
W91-00341 5F

INDICATORS
Distribution and Correlation of Elements in Waters, Suspensions, Sediments, and Marine Organisms from the Black Sea.
W91-00797 5A

INDIRECT FLOOD MEASUREMENT
Palaeoflood Hydrology: A Tool for South Africa--An Example from the Crocodile River near Brits, Transvaal, South Africa.
W91-00636 2E

INDUCED POLARIZATION
More Accurate Determination of Aquifer Parameters Using the IP Sounding Method.
W91-00238 7B

INDUSTRIAL DEVELOPMENT
Trace Metal Wet Deposition in Sweden: Insight Gained from Daily Wet Only Collection.
W91-00853 5B

INDUSTRIAL WASTES
Geochemical Study of Sediment Contamination in New Bedford Harbor, Massachusetts.
W91-00043 5B

Comparative Toxicity of an Effluent from a Chlor-Alkali Industry and HgCl2.
W91-00210 5C

Gas-Phase and Activated Carbon Mediated Thermal Hydrogenolysis of Halogenated Organics.
W91-00395 5D

Distillation.
W91-00913 5D

INDUSTRIAL WASTEWATER
Use of Statistical Methods in Industrial Water Pollution Control Regulations in the United States.
W91-00125 5G

Continuous Effluent Consents: Modelling and Compliance Testing.
W91-00126 5G

Auditing the Quality of Effluent Discharges.
W91-00127 5G

Status of the Niagara River Point Source Discharge Information: Sampling Design and Estimation of Loading.
W91-00134 5B

Inferences About Point Source Loading from Upstream/Downstream River Monitoring Data.
W91-00135 5B

Bacteria Degrading Phenolic Acids Isolated on a Polymeric Phenolic Pigment.
W91-00873 5D

INFECTION
Human Activities Leading to Contact with Water in a Schistosomiasis Endemic Area, Southwest Saudi Arabia: Preliminary Observations.
W91-00678 5C

INFILTRATION
Modeling Infiltration in Hysteretic Soils.
W91-00118 2G

Infiltration Under Ponded Conditions: 3. A Predictive Equation Based on Physical Parameters.
W91-00790 2G

Water Quality and PAM interactions in Reducing Surface Sealing.
W91-00791 4D

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.
W91-00864 2G

INFILTRATION CAPACITY
Infiltration Under Ponded Conditions: 3. A Predictive Equation Based on Physical Parameters.
W91-00790 2G

INFORMATION SYSTEMS
Statistics-Based System for Treatment Plant Operation.
W91-00129 5D

National Water Information System User's Manual Volume 2, Chapter 3. Automated Data Processing System.
W91-00442 7C

Sources of Water-Use Information in Maine.
W91-00443 6D

INFORMATION TRANSFER
Effects of Recharge Systems on Hydrological Information Transfer Along Rivers.
W91-00984 2E

INFRARED IMAGERY
Remote-Sensing Application to Well Monitoring.
W91-00169 2F

HAPEX-MOBILHY: Results from a Large-Scale Field Experiment.
W91-00456 7B

INFRARED RADIATION
NIMBUS 7 LIMS Water Vapor Measurements.
W91-00581 2B

INHIBITION
Respiration Inhibition Kinetic Analysis.
W91-00810 5D

INJECTION WELLS
Subsurface Injection of Liquid Hazardous Wastes.
W91-00950 5E

INLETS
Vortex Drop Inlet for Supercritical Approaching Flow.
W91-00153 8A

Improvement of Bypassing and Backpassing at Tidal Inlets.
W91-00178 8A

INORGANIC COMPOUNDS
Evaluation of Methods Used from 1965 Through 1982 to Determine Inorganic Constituents in Water Samples.
W91-00350 7B

INSECTICIDES
Bioaccumulation of Kepone by Grass Shrimp (Palaemonetes pugio): Importance of Dietary Accumulation and Food Ration.
W91-00201 5B

INSECTS
Effects of Sediment and Flow Regime on the Aquatic Insects of a High Mountain Stream.
W91-00776 2H

INSTREAM FLOW
Physical Habitat Simulation and Sedimentation.
W91-00303 4C

INSTREAM FLOW DEMAND
Enhancement of Benthic Macroinvertebrates by Minimum Flow from a Hydroelectric Dam.
W91-00778 6G

INSTREAM FLOW INCREMENTAL METHODOLOGY
Variability of Results From the Use of PHABSIM in Estimating Habitat Area.
W91-00775 7C

INSTRUMENTATION
Fourier and Moment Methods Applied to Two-Dimensional Raindrop Images.
W91-00055 2B

Effect of Irregularities in the Diameter Classification of Raindrops by the Joss-Waldvogel Disdrometer.
W91-00141 2B

Results of Qualification Tests on Water-Level Sensing Instruments, 1987.
W91-00356 7B

Radar Data Processing for Hydrology in the Cevennes Region.
W91-00466 7B

Microbial Sensor for BOD.
W91-00812 5A

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

INTERBASIN TRANSFERS
Report of the River Master of the Delaware River for the Period December 1, 1987 - November 30, 1988.
W91-00344 2E

INTERCEPTION
Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

INTERCEPTION LOSS
Interception Loss and Rainfall Redistribution by Three Semi-Arid Growing Shrubs in Northeastern Mexico.
W91-00878 2I

INTERSTATE COMPACTS
Annual Yield and Selected Hydrologic Data for the Arkansas River Basin Compact Arkansas--Oklahoma 1989 Water Year.
W91-00360 2E

INTERSTITIAL WATER
Mineralization, Pore Water Chemistry and Phosphorus Release from Peaty Sediments in the Eutrophic Loosdrecht Lakes, The Netherlands.
W91-00426 2H

Porewater Mixing by Microorganisms, Monitored by a Radiotracer Method.
W91-00693 2J

Nutrients in Pore Waters from Dead Sea Sediments.
W91-00742 2H

INTERTIDAL AREAS
Influence of Sewage Pollution on a Rocky Intertidal Community Dominated by the Mytilid Brachidontes rodriguezi.
W91-00764 5C

INVERTEBRATES
Macrophyte Associated Invertebrates and the Effect of Habitat Permanence.
W91-00052 2H

Posttreatment Effects of Forest Fertilization on the Predominant Benthic Community of a Headwater Stream in Eastern Kentucky.
W91-00109 5C

Interactions Among Nutrients, Algae and Invertebrates in a New Zealand Mountain Stream.
W91-00422 2E

Relationships Between Acidity and Benthic Invertebrates of Low-Order Woodland Streams in the Adirondack Mountains, New York.
W91-00657 5C

Response of a Brook Trout (Salvelinus fontinalis) Population to a Reduction in Stream Benthos Following an Insecticide Treatment.
W91-00660 5C

Littoral Benthic Fauna of Lake Managua, Nicaragua: A Study Comparing Artificial and Natural Substrata.
W91-00681 2H

Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

Cyclomorphosis in Daphnia: An Adaptation to Avoid Invertebrate Predation.
W91-00696 2H

Classification of the Macroinvertebrate Fauna of Two River Systems in Southwestern Australia in Relation to Physical and Chemical Parameters.
W91-00774 2H

Enhancement of Benthic Macroinvertebrates by Minimum Flow from a Hydroelectric Dam.
W91-00778 6G

ION EXCHANGE
Ion Exchange.
W91-00916 5D

IOWA
Seasonal Habitat Use by Walleye in a Warmwater River System, as Determined by Radiotelemetry.
W91-00009 8I

Case-Control Study of Multiple Cancer Sites and Water Chlorination in Iowa.
W91-00507 5C

Superfund Record of Decision Midwest Manufacturing, IO.
W91-00556 5G

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly.
W91-00566 5G

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly, Appendix 2 - Written Comments.
W91-00567 5G

IRON
Geochemistry of Iron in a Sand Dune Aquifer, Near Coos Bay and North Bend, Oregon.
W91-00430 2K

IRON UPTAKE
Iron-Binding Compounds and Related Outer Membrane Proteins in Vibrio cholerae Non-O1 Strains from Aquatic Environments.
W91-00830 5B

IRRIGATION
Trends in Irrigation Development, and Their Implications for Hydrologists and Water Resources Engineers.
W91-00377 3F

IRRIGATION

Operation and Maintenance Activities of an Irrigation System in Java (in Japanese).
W91-00767 3F

IRRIGATION DESIGN

Heuristic Closed-Loop Controller for Water Distribution in Complex Irrigation Systems.
W91-00582 3F

Dynamic Optimization Model for Irrigation Investment and Management Under Limited Drainage Conditions.
W91-00583 3F

Simulating Physical Processes and Economic Behavior in Saline, Irrigated Agriculture: Model Development.
W91-00585 3C

Operation and Maintenance Activities of an Irrigation System in Java (in Japanese).
W91-00767 3F

IRRIGATION EFFECTS

Reconnaissance Investigation of Water Quality, Bottom Sediment, and Biota Associated with Irrigation Drainage in and near Stillwater Wildlife Management Area, Churchill County, Nevada, 1986-87.
W91-00351 5C

IRRIGATION EFFICIENCY

Dynamics of Simulated Effects of Irrigation over Dryland Farming in Saskatchewan.
W91-00091 3F

IRRIGATION ENGINEERING

Drip Irrigation Nonlinear Optimization Model.
W91-00168 3F

Water and Nitrogen Management in Central Platte Valley of Nebraska.
W91-00173 3F

IRRIGATION OPERATION

Operation and Maintenance Activities of an Irrigation System in Java (in Japanese).
W91-00767 3F

IRRIGATION PRACTICES

Conjunctive Use for Irrigation Development in Alluvial Regions: Problems, Prospects and Research Issues.
W91-00261 3F

Heuristic Closed-Loop Controller for Water Distribution in Complex Irrigation Systems.
W91-00582 3F

Dynamic Optimization Model for Irrigation Investment and Management Under Limited Drainage Conditions.
W91-00583 3F

Simulating Physical Processes and Economic Behavior in Saline, Irrigated Agriculture: Model Development.
W91-00585 3C

IRRIGATION PROGRAMS

Dynamics of Simulated Effects of Irrigation over Dryland Farming in Saskatchewan.
W91-00091 3F

Trends in Irrigation Development, and Their Implications for Hydrologists and Water Resources Engineers.
W91-00377 3F

Benefits of an Irrigation Water Rental Market in a Saline Stream-Aquifer System.
W91-00586 3F

IRRIGATION WATER

Heuristic Closed-Loop Controller for Water Distribution in Complex Irrigation Systems.
W91-00582 3F

Dynamic Optimization Model for Irrigation Investment and Management Under Limited Drainage Conditions.
W91-00583 3F

Benefits of an Irrigation Water Rental Market in a Saline Stream-Aquifer System.
W91-00586 3F

Relative Performance of a Soil Moisture Accounting Model in Estimating Return Flow.
W91-00887 2G

Real Time Simulation Model as a Decision Support System for Surface Water Management.
W91-00998 4A

ISOLATION

Shake Table Test of Cylindrical Water Tanks in Base-Isolated Structures.
W91-00147 8E

ISOTOPE FRACTIONATION

Using Isotope Fractionation of Nitrate-Nitrogen and Nitrate-Oxygen for Evaluation of Microbial Denitrification in a Sandy Aquifer.
W91-00166 5B

ISOTOPE STUDIES

Using Isotope Fractionation of Nitrate-Nitrogen and Nitrate-Oxygen for Evaluation of Microbial Denitrification in a Sandy Aquifer.
W91-00166 5B

ISOTOPIC TRACERS

Po210 and Pb210 Remobilization from Lake Sediments in Relation to Iron and Manganese Cycling.
W91-00624 5B

ISRAEL

Determination of the Environmental Capacity of Haifa Bay with Respect to the Input of Mercury.
W91-00706 5B

ITALY

Propagation of Periodic Waves in the Lido Channel of the Venice Lagoon.
W91-00121 2L

IVORY COAST

Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

JAMAICA

Beach Tar Contamination in Jamaica.
W91-00702 5B

JAMES RIVER

Field Evaluation of the Effect of Chlorinated Treated Sewage on Settlement of Oysters (Crassostrea virginica Gmelin) and Barnacles (Balanus sp).
W91-00511 5C

JAPAN

Water Supply in Fast-Growing Cities: Tokyo, Japan.
W91-00021 6D

Oxidation of S(IV) in Rain-Water Collected in Japan.
W91-00668 5B

Origin of Soluble Chemical Species in Bulk Precipitation Collected in Tokyo, Japan: Statistical Evaluation of Source Materials.
W91-00670 5B

Microcystin Composition of an Axenic Clonal Strain of Microcystis viridis and Microcystis viridis-Containing Waterblooms in Japanese Freshwaters.
W91-00699 5C

Monthly Variations in Entropy Production in Lake Biwa.
W91-00717 2H

Release of Heavy Metals from Snowpacks on the Japan Sea Side of Japan.
W91-00858 5B

Diurnal Fluctuation in Stream Flow and in Specific Electric Conductance During Drought Periods.
W91-00881 2E

Motion of Coastal Groundwater in Response to the Tide.
W91-00884 2F

JAVA

Operation and Maintenance Activities of an Irrigation System in Java (in Japanese).
W91-00767 3F

JOHN DEERE DUBUQUE WORK SITE

Superfund Record of Decision, John Deere Dubuque Works, IA.
W91-00559 5G

JOINT SYSTEMS ANALYSIS

Joint System Analysis for the Evaluation of Flow in Fractured Aquifer.
W91-00228 7C

JOSS-WALDVOGEL DISDROMETER

Effect of Irregularities in the Diameter Classification of Raindrops by the Joss-Waldvogel Disdrometer.
W91-00141 2B

KALAVAD TALUKA

Description of Lineaments Found in Kalavad Taluka of Jamnagar District and Drilling Drilled for Water Supply.
W91-00248 2F

KANSAS

Opportunities for Reservoir-storage Reallocation.
W91-00186 6E

Hydrogeology and Ground-Water-Quality Conditions at the Geary County Landfill, Northeast Kansas, 1988.
W91-00338 5B

KARST

Integrated Geological and Geophysical Investigations for Delineating Karstic Zones in Carbonate Formations of Anantapur District, A.P., India.
W91-00239 2F

Hydrogeology of the Dinaric Karst.
W91-00318 2F

Geology of Karst Terrains and Theory in the Works of Jovan Cvijic.
W91-00319 8E

Hydrogeologic Regional Classification of Karst in Yugoslavia.
W91-00320 2F

Hydrogeologic Features of the Dinaric Karst.
W91-00321 2F

Speleological Phenomena of Dinaric Karst.
W91-00322 2F

Karst Poljes in Dinarides.
W91-00323 2F

Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

Application of Geophysical Methods to Hydrogeological Problems in Dinaric Karst of Yugoslavia.
W91-00326 7B

Some Methods of Hydrogeologic Exploration and Water Regulation in the Dinaric Karst with Special Reference to Their Application in Eastern Herzegovina.
W91-00327 2F

Hydrogeologic Features of Typical Karst Terrains in Montenegro.
W91-00328 2F

Hydrogeological Features of Some Northern Dalmatia Littoral Karst Parts, Lika and Croatian Littoral.
W91-00329 2F

Hydrogeologic Features of Some Karst Parts of Slovenia.
W91-00330 2F

Using Rn222 to Examine Groundwater/Surface Discharge Interaction in the Rio Grande de Manati, Puerto Rico.
W91-00893 2F

KARST HYDROLOGY

Integrated Geological and Geophysical Investigations for Delineating Karstic Zones in Carbonate Formations of Anantapur District, A.P., India.
W91-00239 2F

Hydrogeology of the Dinaric Karst.
W91-00318 2F

Geology of Karst Terrains and Theory in the Works of Jovan Cvijic.
W91-00319 8E

Hydrogeologic Regional Classification of Karst in Yugoslavia.
W91-00320 2F

Hydrogeologic Features of the Dinaric Karst.
W91-00321 2F

Karst Poljes in Dinarides.
W91-00323 2F

Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

Problems of Sea Water Intrusion into Aquifers of the Coastal Dinaric Karst.
W91-00325 2F

Some Methods of Hydrogeologic Exploration and Water Regulation in the Dinaric Karst with Special Reference to Their Application in Eastern Herzegovina.
W91-00327 2F

Hydrogeologic Features of Typical Karst Terrains in Montenegro.
W91-00328 2F

Hydrogeological Features of Some Northern Dalmatia Littoral Karst Parts, Lika and Croatian Littoral.
W91-00329 2F

Hydrogeologic Features of Some Karst Parts of Slovenia.
W91-00330 2F

Fate and Transport of Petroleum Released from Underground Storage Tanks.
W91-00452 5B

Hydrology of the Karst Aquifer at the Experimental Site of Guilin in Southern China.
W91-00891 2F

Using Rn222 to Examine Groundwater/Surface Discharge Interaction in the Rio Grande de Manati, Puerto Rico.
W91-00893 2F

Effects of Recharge Systems on Hydrological Information Transfer Along Rivers.
W91-00984 2E

KENTUCKY

Fishes of Bullitt County, Kentucky.
W91-00108 4C

Posttreatment Effects of Forest Fertilization on the Predominant Benthic Community of a Headwater Stream in Eastern Kentucky.
W91-00109 5C

Spatial and Temporal Variability of Precipitation Across Kentucky.
W91-00110 2B

KINEMATIC WAVE THEORY

Perturbation Solution of the Flood-Routing Problem.
W91-00763 7C

Influence of the Angle of Incidence of the Rainfall on the Overland Flow Process.
W91-00969 2J

Use of Kinematic Wave Method to Assess Effects of Urban Development on Flood Peak Changes.
W91-00971 4C

KINETICS

Development of Chlorine Demand Kinetics in a Drinking Water Treatment Plant.
W91-00530 5F

Biodegradation Kinetics of Substituted Phenolics: Demonstrations of a Protocol Based on Electrolytic Respirometry.
W91-00809 5B

Respiration Inhibition Kinetic Analysis.
W91-00810 5D

KLEBSIELLA

Long-term Survival of and Plasmid Stability in Pseudomonas and Klebsiella Species and the Appearance of Nonculturable Cells in Agricultural Drainage Water.
W91-00733 5B

KOREA

Environmental Isotope-Aided Study on River Water and Groundwater Interaction in the Region of Seoul and Taegu.
W91-00257 2A

KRIGING

Some Fundamental Weak Spots of Kriging Technique and Their Consequences.
W91-00159 7C

Kriged Estimates of Water-Levels from the Sparse Measurements in a Hard Rock Aquifer.
W91-00245 2F

Cokriging to Assess Regional Stream Quality in the Southern Blue Ridge Province.
W91-00589 5B

KUWAIT

Crude Oil and Hydrocarbon-degrading Strains of Rhodococcus rhodochrous Isolated from Soil and Marine Environments in Kuwait.
W91-00144 5B

KYMIJOKI RIVER

Reintroduction of Salmon and Sea Trout into the Vantaanjoki and Kymijoki Rivers (Lohen ja Meritaimenen Palautttaminen Vantaanjokeen ja Kymijokeen).
W91-00017 8I

LABORATORIES

Selected Quality Assurance Data for Water Samples Collected by the U.S. Geological Survey, Idaho National Engineering Laboratory, Idaho, 1980 to 1988.
W91-00334 7B

LABORATORY METHODS

Measurements of Gas Concentration Fluctuations at Water Surface.
W91-00065 2K

Evaluation of Methods Used from 1965 Through 1982 to Determine Inorganic Constituents in Water Samples.
W91-00350 7B

Measurement of Biodegradable Organic Matter and Bacterial Growth Potential in Drinking Water.
W91-00381 5F

Evaluation of Protocol for Preparing Drinking Water Samples for Ames Mutagenicity Testing.
W91-00496 5A

Fish Hepatocyte Model for Investigation of the Effects of Trihalomethanes.
W91-00503 7B

Identification of Organic N-Chloramines in Wastewater.
W91-00533 5A

Sequential Inoculation as an Adjunct in Enteric Virus Plaque Enumeration.
W91-00815 5A

Note on the Analysis of Moisture-Depth Curves Obtained by the Hot-Air Method for the Determination of Soil Moisture Diffusivity.
W91-00889 2G

Method to Extract Soil Water for Stable Isotope Analysis.
W91-00898 2G

LACUSTRINE ENVIRONMENT

Pigment Stratigraphy and Trophic Status: An Evaluation of Radionuclide-Dated Lacustrine Sediment.
W91-00692 2H

Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

LAGOONS

Influence of Salinity on the Concentration and Rate of Interchange of Dissolved Phosphate between Water and Sediment in Fuente Piedra Lagoon (S. Spain).
W91-00743 2L

Lagoons, Leach Fields, and Other Assistants of Nature.
W91-00799 5D

LAKE ACIDIFICATION

Responses of Zooplankton and Zoobenthos to Experimental Acidification in a High-Elevation Lake (Sierra Nevada, California, U.S.A).
W91-00425 5C

Episodic Acidification of Adirondack Lakes During Snowmelt.
W91-00608 5B

Phytoplankton Communities of Lakes Experimentally Acidified with Sulfuric and Nitric Acids.
W91-00659 5C

LAKE AYDAT
Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

LAKE ERIE
Evaluation of Phosphorus Loads from Ontario Municipal Wastewater Treatment Plants.
W91-00132 5D

Variation in Lake Water Temperature in the Nanticoke Region of Long Point Bay, Lake Erie, During the Open-Water Season.
W91-00661 2H

Influence of Upwellings, Storms, and Generating Station Operation on Water Chemistry and Plankton in the Nanticoke Region of Long Point Bay, Lake Erie.
W91-00662 2H

LAKE FISHERIES
Cultivaton and Management of Landlocked Salmon and Charr in Lake Saimaa (Saimaan Jarvilohen ja Nierian Viljely ja Hoito).
W91-00018 8I

Research on the Fisheries of Small Lakes (Pienten Jarvien Kalatutkimukset).
W91-00019 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: I. Characteristics and Evaluation of Feeding Conditions (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: I. Charakterystyka I Ocena Warunkow Pokarmowych).
W91-00783 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: II. Qualitative and Quantitative Analyses of Nutrition and Nutritional Selectivity (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: II. Jakosciowa I Ilosciowa Analiza Pokarmu Oraz Wybiorczosc Pokarmowa).
W91-00784 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: III. Attempt to Evaluate the Pressure on Plankton of the Introduced Fish Population (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: III. Proba Oceny Presji Introdukowanej Populacji Ryb Na Plankton).
W91-00785 8I

LAKE GALLOCANTA
Hydrogeochemistry of Lake Gallocanta (Aragon, NE Spain).
W91-00740 2H

LAKE NASSER
Monitoring Lake Nasser by Space Sensing.
W91-00473 7B

LAKE ONTARIO
Evaluation of Phosphorus Loads from Ontario Municipal Wastewater Treatment Plants.
W91-00132 5D

Estimation of Phosphorus from the Niagara River to Lake Ontario.
W91-00133 5E

LAKE RESTORATION
Moses Lake Clean Lake Project. Final Stage 3 Report.
W91-00554 5G

Sylvan Lake Restoration Project.
W91-00562 5G

Lake Restoration Project, North Hudson Park Lake, Bergen, New Jersey.
W91-00563 5G

Dredging of North Park Lake, County of Allegheny, Pennsylvania.
W91-00564 5G

Reduction of Phosphorus and Chlorophyll a Concentrations Following CaCO3 and Ca(OH)2 Additions to Hypereutrophic Figure Eight Lake, Alberta, Canada.
W91-00625 5F

Creating Conditions for Changes in Prey Community Structure by Chaoborus spp. in a Lake in Sweden.
W91-00697 2H

LAKE ROTOITI
Water Balance of Lake Rotoiti, North Island: Floods and Short-Circuiting of Inflows from Lake Rotorua.
W91-00077 2H

LAKE ROTORUA
Water Balance of Lake Rotoiti, North Island: Floods and Short-Circuiting of Inflows from Lake Rotorua.
W91-00077 2H

LAKE SAIMAA
Cultivaton and Management of Landlocked Salmon and Charr in Lake Saimaa (Saimaan Jarvilohen ja Nierian Viljely ja Hoito).
W91-00018 8I

LAKE SEDIMENTS
Spatially Continuous Determination of Groundwater Flow to Surface Water Bodies: Application to the Connecting Channels Between Lakes Huron and Erie.
W91-00163 2A

Po210 and Pb210 Remobilization from Lake Sediments in Relation to Iron and Manganese Cycling.
W91-00624 5B

LAKE TIBERIAS
Trihalomethane Formation and Distribution in Bromide-Rich and Ammonia-Containing Lake Water.
W91-00526 5B

LAKES
Water Balance of Lake Rotoiti, North Island: Floods and Short-Circuiting of Inflows from Lake Rotorua.
W91-00077 2H

Short-Term Productivity Responses of Algae and Bacteria to Zooplankton Grazing in Two Freshwater Lakes.
W91-00418 2H

Competition and Coexistence in Submerged Aquatic Plant Communities: The Effects of Species Interactions Versus Abiotic Factors.
W91-00423 2H

Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

Responses of Zooplankton and Zoobenthos to Experimental Acidification in a High-Elevation Lake (Sierra Nevada, California, U.S.A).
W91-00425 5C

Mineralization, Pore Water Chemistry and Phosphorus Release from Peaty Sediments in the Eutrophic Loosdrecht Lakes, The Netherlands.
W91-00426 2H

Manipulating Lake Community Structure: Where Do We Go from Here.
W91-00428 2H

Synchronous Fluorescence Spectroscopy of Dissolved Organic Matter in Surface Waters: Application to Airborne Remote Sensing.
W91-00639 5A

Ecological Studies on the Plankton and Benthos of Wadi Elrayan, a New Lake in Egypt.
W91-00679 2H

Littoral Benthic Fauna of Lake Managua, Nicaragua: A Study Comparing Artificial and Natural Substrata.
W91-00681 2H

Predicting Success of Walleye Stocking Programs in the United States and Canada.
W91-00691 8I

Predation on and by Pelagic Turbellaria in Some Lakes in Brazil.
W91-00695 2H

Cyclomorphosis in Daphnia: An Adaptation to Avoid Invertebrate Predation.
W91-00696 2H

Creating Conditions for Changes in Prey Community Structure by Chaoborus spp. in a Lake in Sweden.
W91-00697 2H

Seasonal Changes of the Environmental Conditions in Dimictic Lakes Differing as to Their Trophic State (Sezonowe Zmiany Warunkow Srodowiska w Jeziorach Dymiktycznych o Roznym Stopniu Eutrofizacji).
W91-00735 2H

Sediment-Water Interaction as a Control on Geochemical Evolution of Playa Lake Systems in the Australian Arid Interior.
W91-00736 2H

Metal Concentrations in Surficial Sediments from Hypersaline Lakes, Australia.
W91-00737 2K

Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

Evolution of Saline Lake Waters: Gradual and Rapid Biogeochemical Pathways in the Basotu Lake District, Tanzania.
W91-00739 2H

Hydrogeochemistry of Lake Gallocanta (Aragon, NE Spain).
W91-00740 2H

Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

Nutrients in Pore Waters from Dead Sea Sediments.
W91-00742 2H

Influence of Salinity on the Concentration and Rate of Interchange of Dissolved Phosphate between Water and Sediment in Fuente Piedra Lagoon (S. Spain).
W91-00743 2L

Solubility of Oxygen in the Dead Sea Brine.
W91-00744 2K

Vernal Microstratification Patterns in a Meromictic Saline Lake: Their Causes and Biological Significance.
W91-00745 2H

Production and Decomposition in a Saline Meromictic Lake.
W91-00746 2H

Autumnal Mixing in Mahoney Lake, British Columbia.
W91-00747 2H

Changes in Lake Levels, Salinity and the Biological Community of Great Salt Lake (Utah, USA), 1847-1987.
W91-00748 2H

Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

Distribution and Abundance of Littoral Benthic Fauna in Canadian Prairie Saline Lakes.
W91-00751 2H

Distribution and Abundance of the Alkali Fly (Ephydra hians) Say at Mono Lake, California (USA) in Relation to Physical Habitat.
W91-00752 2H

Distribution Patterns of Ostracods in Iberian Saline Lakes. Influence of Ecological Factors.
W91-00753 2H

Anostraca, Cladocera and Copepoda of Spanish Saline Lakes.
W91-00754 2H

Artemia monica Cyst Production and Recruitment in Mono Lake, California, USA.
W91-00755 2H

Comparative Limnology of Sambhar and Didwana Lakes (Rajasthan, NW India).
W91-00756 2H

Salinity as a Determinant of Salt Lake Fauna: A Question of Scale.
W91-00757 2H

Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

Absolute Dating of Sedimentation on Lake Torres with Spring Deposits, South Australia.
W91-00760 2H

Chemical Characteristics of the Water of Chascomus Pond (Provincia de Buenos Aires, Argentina): Limnological Implications (Caracteristicas Quimicas das Aguas da Lagoa de Chascomus (Provincia de Buenos Aires, Argentina). Implicancias Limnologicas).
W91-00781 2H

Microbiological Investigations of Lake Niegocin (Badania Mikrobiologiczne Jeziora Niegocin).
W91-00787 5B

LAND DISPOSAL

Land Treatment of Hazardous Wastes.
W91-00945 5D

Hazardous-Waste Landfill Construction: The State of the Art.
W91-00948 5E

LAND MANAGEMENT

Simulation of Land Use Changes and Impacts on the Water Balance: A Case Study for Belgium.
W91-00162 4C

Geomorphic Design and Management of Disturbed Lands.
W91-00296 4C

LAND RECLAMATION

Geomorphic Design and Management of Disturbed Lands.
W91-00296 4C

LAND TREATMENT

Lagoons, Leach Fields, and Other Assistants of Nature.
W91-00799 5D

LAND USE

Fishes of Bullitt County, Kentucky.
W91-00108 4C

Simulation of Land Use Changes and Impacts on the Water Balance: A Case Study for Belgium.
W91-00162 4C

Geomorphic Design and Management of Disturbed Lands.
W91-00296 4C

Long and Short-term Episodic Storage and Removal of Sediment in Watersheds of Southwestern Wisconsin and Northwestern Illinois.
W91-00297 2J

Hydrologic and Chemical-Quality Data from Four Rural Basins in Guilford County, North Carolina, 1985-88.
W91-00433 5B

Hydrological Effects of Catchment Characteristics and Land Use Changes Determined by Satellite Imagery and GIS.
W91-00472 2A

Logging Effects on Streamflow: Storm Runoff at Caspar Creek in Northwestern California.
W91-00610 4C

Fate of Aquatic and Wetland Habitats in an Industrially Contaminated Section of the Elbe Floodplain in Hamburg.
W91-00648 5B

Evaluation and Prediction of Possible Man-Induced Changes in the Hydrological Cycle.
W91-00967 4C

LANDFILL LININGS

Synthetic Linings.
W91-00949 5E

LANDFILLS

Hydrogeology and Ground-Water-Quality Conditions at the Geary County Landfill, Northeast Kansas, 1988.
W91-00338 5B

Hydrogeology and Simulation of Ground-Water Flow at Superfund-Site Wells G and H, Woburn, Massachusetts.
W91-00340 2F

Transport of Low-Concentration Contaminants in Saturated Earthen Barriers.
W91-00372 5E

Land Treatment of Hazardous Wastes.
W91-00945 5D

Hazardous-Waste Landfill Construction: The State of the Art.
W91-00948 5E

Synthetic Linings.
W91-00949 5E

Soil Liners.
W91-00952 5E

Aboveground Disposal.
W91-00954 5E

LANDSAT IMAGES

Monitoring Lake Nasser by Space Sensing.
W91-00473 7B

LANDSLIDES

Water Waves Generated by Distant Landslides.
W91-00071 2H

Sediment Yield and Discharge in Mountainous Small River Basins: Actual Condition of Sediment Discharge After Damage Caused by Sand and Stone Avalanches (in Japanese).
W91-00766 2J

LARVAE

Relationships Between Copper Concentrations in Larvae of Plectrocnemia conspersa (Curtis) (Trichoptera) and in Mine Drainage Streams.
W91-00859 5B

LAS VEGAS VALLEY

Ground-Water Conditions in Las Vegas Valley, Clark County, Nevada. Part 1: Hydrogeologic Framework.
W91-00429 2F

LEACH FIELDS

Lagoons, Leach Fields, and Other Assistants of Nature.
W91-00799 5D

LEACHATES

Identification of Solubility-Controlling Solid Phases in a Large Fly Ash Field Lysimeter.
W91-00621 5B

LEACHING

What Is a Leacher.
W91-00362 5B

Simulation of Nitrate Nitrogen Breakthrough Curves Stemming from Leaching of Ammonium Nitrate Through Soil.
W91-00896 5B

LEAD

Superfund Record of Decision: Beachwood/Berkeley, NJ.
W91-00451 5G

Lead Poisoning in Magpie Geese Anseranus semipalmata from Ingested Lead Pellet at Bool Lagoon Game Reserve (South Australia).
W91-00687 5C

Comparative Study of Toxic Lead Effect on Gill and Hemoglobin of Tilapia Fish.
W91-00722 5A

Distribution and Transport of Sediment-Bound Metal Contaminants in the Rio Grande de Tarcoles, Costa Rica (Central America).
W91-00804 5A

LEAD RADIOISOTOPES

Po210 and Pb210 Remobilization from Lake Sediments in Relation to Iron and Manganese Cycling.
W91-00624 5B

LEAKAGE

Optimal Valve Control in Water-distribution Networks.
W91-00180 5F

LEAVES

Nutrient Dynamics of Decomposing Leaves from Amazonian Floodplain Forest Species in Water.
W91-00824 2H

LEGAL ASPECTS

Ground-water-management Areas in United States.
W91-00182 4B

Principles of a Ground-water Strategy.
W91-00183 6A

Hazardous-Waste Treatment Comes of Age.
W91-00901 5G

Summary of Resource Conservation and Recovery Act Legislation and Regulation.
W91-00902 6E

Summary of CERCLA Legislation and Regulations and the EPA Superfund Program.
W91-00903 6E

Environmental Risk-Assessment and Audit Principles.
W91-00909 5E

LEGIONELLA
Microbiological Investigations into an Outbreak of Pontiac Fever Due to Legionella micdadei Associated with Use of a Whirlpool.
W91-00840 5A

Incidence of Bdellovibrio spp. in Man-Made Water Systems: Coexistence with Legionellas.
W91-00876 5F

LEGISLATION
Ground-water-management Areas in United States.
W91-00182 4B

Ground Water Management in the South Platte Basin of Colorado.
W91-00413 4B

Response of the US EPA Region V States to the Nonpoint Source Reporting Requirements of the 1987 Clean Water Act Amendments.
W91-00565 5G

LENTIC ENVIRONMENT
Seasonal Variability in the Sensitivity of Freshwater Lentic Communities to a Chronic Copper Stress.
W91-00196 5C

LETHAL LIMIT
Chlorine Sensitivity of Early Life Stages of Freshwater Fish.
W91-00514 5C

LIABILITY
Environmental Risk-Assessment and Audit Principles.
W91-00909 5E

LICENSING
Water Auctions as an Allocation Mechanism in Victoria, Australia.
W91-00080 6C

Credentialing in the Forestry Profession.
W91-00276 6E

Professional Registration for Hydrologists in Arizona: A Proposal Prepared by the Arizona Hydrological Society.
W91-00278 6E

LIDO CHANNEL
Propagation of Periodic Waves in the Lido Channel of the Venice Lagoon.
W91-00121 2L

LIGHT INTENSITY
Vegetative Growth of Spirodela polyrrhiza as Affected by Medium Concentration, Daylight Intensity and Age.
W91-00684 2H

Resistance of Lotic Ecosystems to a Light Elimination Disturbance: A Laboratory Stream Study.
W91-00709 2H

LIGHTING
Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

LIMING
Reduction of Phosphorus and Chlorophyll a Concentrations Following CaCO3 and Ca(OH)2 Additions to Hypereutrophic Figure Eight Lake, Alberta, Canada.
W91-00625 5F

Creating Conditions for Changes in Prey Community Structure by Chaoborus spp. in a Lake in Sweden.
W91-00697 2H

Seasonal, Hydrological, and Land Management Factors Controlling Dissolved Organic Carbon Concentrations in the Loch Fleet Catchments, Southwest Scotland.
W91-00862 2H

Effects of Catchment Liming and Afforestation on the Concentration and Fractional Composition of Aluminum in the Loch Fleet Catchment, SW Scotland.
W91-00897 5G

LIMITING NUTRIENTS
Resource Limitation in a Stream Community: Phosphorus Enrichment Effects on Periphyton and Grazers.
W91-00618 2H

Phosphorus and Nitrogen Limitation of Phytoplankton Growth in the Freshwaters of North America: A Review and Critique of Experimental Enrichments.
W91-00664 2H

LIMNOLOGY
Empirical Models for Predicting Water Quality, as Applied to Data on Lakes of Poland.
W91-00001 2H

Numerical Model of Phosphorus Exchange Between the Sediments and the Near-Bottom Water in a Lake.
W91-00002 2H

Simulation Model of Phosphorus Cycling in the Epilimnion of a Eutrophic Lake.
W91-00003 2H

Methods for Improving the Efficiency of Calibration of a Model of Phosphorus Cycling in a Lake Ecosystem.
W91-00004 2H

Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

Macrophyte Associated Invertebrates and the Effect of Habitat Permanence.
W91-00052 2H

Short-Term Productivity Responses of Algae and Bacteria to Zooplankton Grazing in Two Freshwater Lakes.
W91-00418 2H

Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Competition and Coexistence in Submerged Aquatic Plant Communities: The Effects of Species Interactions Versus Abiotic Factors.
W91-00423 2H

Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

Water Temperature in a Stream Gravel Bed and Implications for Salmonid Incubation.
W91-00427 8I

Manipulating Lake Community Structure: Where Do We Go from Here.
W91-00428 2H

Nutrient Status of Ombrotrophic Peat Bogs.
W91-00640 2H

Comparative Development of Bogs and Fens in Central Sweden: Evaluating the Role of Climate Change and Ecosystem Development.
W91-00641 2H

Vegetation and Paleoecology of a Bog Complex in S Finland.
W91-00642 2H

Periodic Moisture Fluctuation as a Factor Affecting Mire Vegetation.
W91-00644 2H

Constant or Increasing Nitrogen Concentrations in Sphagnum Mosses on Mires in Southern Sweden During the Last Few Decades.
W91-00645 2H

Divergent Successions in Mires, a Comparative Study.
W91-00646 2H

Synopsis and Numerical Analysis of the Pre-, Sub-, and Low-Alpine Mire Vegetation of the Uleberg-Skrubben Area, North Norway.
W91-00647 2H

Occurrence of Hypolimnetic Blooms of the Purple Sulfur Bacterium, Thiopedia rosea, and the Green Sulfur Bacterium, Chlorobium limicola, in an Australian Reservoir.
W91-00652 5C

Physicochemistry and Vegetation of Piccaninnie Ponds, a Coastal Aquifer-Fed Pond in Southeastern South Australia.
W91-00653 2H

Grazing on Bacteria by Zooplankton in Australian Billabongs.
W91-00654 2H

Lake Thetis, Western Australia: An Example of Saline Lake Sedimentation Dominated by Benthic Microbial Processes.
W91-00655 2H

Retention and Resuspension of Phosphorus, Nitrogen, and Iron in a Central Ontario Lake.
W91-00656 2H

Use of Extant Populations of Scaled Chrysophytes for the Inference of Lakewater pH.
W91-00658 5A

Phytoplankton Communities of Lakes Experimentally Acidified with Sulfuric and Nitric Acids.
W91-00659 5C

Variation in Lake Water Temperature in the Nanticoke Region of Long Point Bay, Lake Erie, During the Open-Water Season.
W91-00661 2H

Influence of Upwellings, Storms, and Generating Station Operation on Water Chemistry and Plankton in the Nanticoke Region of Long Point Bay, Lake Erie.
W91-00662 2H

Phosphorus and Nitrogen Limitation of Phytoplankton Growth in the Freshwaters of North America: A Review and Critique of Experimental Enrichments.
W91-00664 2H

Limnological Studies of Four Polluted Ponds in and Around Dhaka City with Reference to Indicator Species.
W91-00672 5C

Effects of Nutrients and Water Levels on Emergent Macrophyte Biomass in a Prairie Marsh.
W91-00673 2H

Effects of Nutrients and Water Levels on Species Composition in Prairie Whitetop (Scolochloa festucacea) Marshes.
W91-00674 2H

Ecology of a Mediterranean-Climate Estuarine Wetland at Carpinteria, California: Plant Distributions and Soil Salinity in the Upper Marsh.
W91-00675 2L

Ecological Studies on the Plankton and Benthos of Wadi Elrayan, a New Lake in Egypt.
W91-00679 2H

Littoral Benthic Fauna of Lake Managua, Nicaragua: A Study Comparing Artificial and Natural Substrata.
W91-00681 2H

Ecology of Cyclopoid Copepods (Copepoda: Crustacea) in a Tropical Backwater Pond.
W91-00682 2H

Waterbirds Dynamics at Bool Lagoon, South Australia, 1983-87.
W91-00686 2H

Pigment Stratigraphy and Trophic Status: An Evaluation of Radionuclide-Dated Lacustrine Sediment.
W91-00692 2H

Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

Predation on and by Pelagic Turbellaria in Some Lakes in Brazil.
W91-00695 2H

Cyclomorphosis in Daphnia: An Adaptation to Avoid Invertebrate Predation.
W91-00696 2H

Monthly Variations in Entropy Production in Lake Biwa.
W91-00717 2H

Bacterial Regeneration of Ammonium and Phosphate as Affected by the Carbon:Nitrogen:Phosphorus Ratio of Organic Substrates.
W91-00732 5B

Seasonal Changes of the Environmental Conditions in Dimictic Lakes Differing as to Their Trophic State (Sezonowe Zmiany Warunkow Srodowiska w Jeziorach Dymiktycznych o Roznym Stopniu Eutrofizacji).
W91-00735 2H

Sediment-Water Interaction as a Control on Geochemical Evolution of Playa Lake Systems in the Australian Arid Interior.
W91-00736 2H

Metal Concentrations in Surficial Sediments from Hypersaline Lakes, Australia.
W91-00737 2K

Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

Evolution of Saline Lake Waters: Gradual and Rapid Biogeochemical Pathways in the Basotu Lake District, Tanzania.
W91-00739 2H

Hydrogeochemistry of Lake Gallocanta (Aragon, NE Spain).
W91-00740 2H

Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

Nutrients in Pore Waters from Dead Sea Sediments.
W91-00742 2H

Vernal Microstratification Patterns in a Meromictic Saline Lake: Their Causes and Biological Significance.
W91-00745 2H

Production and Decomposition in a Saline Meromictic Lake.
W91-00746 2H

Autumnal Mixing in Mahoney Lake, British Columbia.
W91-00747 2H

Changes in Lake Levels, Salinity and the Biological Community of Great Salt Lake (Utah, USA), 1847-1987.
W91-00748 2H

Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

Distribution and Abundance of Littoral Benthic Fauna in Canadian Prairie Saline Lakes.
W91-00751 2H

Distribution and Abundance of the Alkali Fly (Ephydra hians) Say at Mono Lake, California (USA) in Relation to Physical Habitat.
W91-00752 2H

Anostraca, Cladocera and Copepoda of Spanish Saline Lakes.
W91-00754 2H

Comparative Limnology of Sambhar and Didwana Lakes (Rajasthan, NW India).
W91-00756 2H

Salinity as a Determinant of Salt Lake Fauna: A Question of Scale.
W91-00757 2H

Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

Marginal Zoobenthos of a Southern Brazilian Dam (Zoobenthos Litoraneos de um Acude Sul-Brasileiro).
W91-00780 6G

Chemical Characteristics of the Water of Chascomus Pond (Provincia de Buenos Aires, Argentina): Limnological Implications (Caracteristicas Quimicas das Aguas da Lagoa de Chascomus (Provincia de Buenos Aires, Argentina). Implicancias Limnologicas).
W91-00781 2H

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: I. Characteristics and Evaluation of Feeding Conditions (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: I. Charakterystyka I Ocena Warunkow Pokarmowych).
W91-00783 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: II. Qualitative and Quantitative Analyses of Nutrition and Nutritional Selectivity (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: II. Jakosciowa I Ilosciowa Analiza Pokarmu Oraz Wybiorczosc Pokarmowa).
W91-00784 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: III. Attempt to Evaluate the Pressure on Plankton of the Introduced Fish Population (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: III. Proba Oceny Presji Introdukowanej Populacji Ryb Na Plankton).
W91-00785 8I

Microbiological Investigations of Lake Niegocin (Badania Mikrobiologiczne Jeziora Niegocin).
W91-00787 5B

Spectroscopic Investigations of Peat-Water Interactions: An ESR, FT-IR, and NMR Study.
W91-00789 2H

Increase in the Oxygen Concentration in Amazon Waters Resulting from the Root Exudation of Two Notorious Water Plants, Eichhornia crassipes (Pontederiaceae) and Pistia stratiotes (Araceae).
W91-00822 2H

Effect of Water Depth and Clipping Frequency on the Growth and Survival of Four Wetland Plant Species.
W91-00836 2J

Non-Linear System to Describe Movements of Water Masses at the LG-2 Reservoir (La Grande, Quebec).
W91-00885 2H

LINERS

Transport of Low-Concentration Contaminants in Saturated Earthen Barriers.
W91-00372 5E

Soil Liners.
W91-00952 5E

LININGS

Synthetic Linings.
W91-00949 5E

LIPIDS

Serum Lipid Levels in Neighboring Communities with Chlorinated and Nonchlorinated Drinking Water.
W91-00510 5C

LIQUID-INJECTION INCINERATORS

Liquid-Injection Incinerators.
W91-00930 5D

LITERATURE REVIEW

Fate and Transport of Petroleum Released from Underground Storage Tanks.
W91-00452 5B

Interim: Selected Chemical Research Reported Between Conferences Five and Six.
W91-00477 5F

Review of Recent Epidemiological Studies Reporting Associations between Drinking Water Disinfection and Cancer.
W91-00505 5F

Acute Toxicity, Sublethal Effects, and Bioconcentration of Chlorination Products, Viruses, and Bacteria in Edible Shellfish: A Review.
W91-00515 5C

Atmospheric Chemistry of Peroxides: A Review.
W91-00841 5B

LITHOLOGY

Lithologic and Hydrologic Properties of Mesozoic Rocks in the Upper Colorado River Basin.
W91-00310 2F

LITTER

Nutrient Dynamics of Decomposing Leaves from Amazonian Floodplain Forest Species in Water.
W91-00824 2H

LITTORAL ENVIRONMENT
Pilot Studies for Designs of Surveys of Human Disturbance of Intertidal Habitats in New South Wales.
W91-00685 4C

Distribution and Abundance of Littoral Benthic Fauna in Canadian Prairie Saline Lakes.
W91-00751 2H

LITTORAL ZONE
Littoral Benthic Fauna of Lake Managua, Nicaragua: A Study Comparing Artificial and Natural Substrata.
W91-00681 2H

Some Preliminary Data on the Nutrient Influx into the Western Black Sea.
W91-00712 5B

LIVER
Effect of Drinking Water Containing Chlorine and Monochloramine on Cholesterol and Triglyceride Levels in the Liver of the Pigeon and Rabbit.
W91-00500 5C

LOCH FLEET
Seasonal, Hydrological, and Land Management Factors Controlling Dissolved Organic Carbon Concentrations in the Loch Fleet Catchments, Southwest Scotland.
W91-00862 2H

LOGGING
Input and Depletion of Woody Debris in Alaska Streams and Implications for Streamside Management.
W91-00011 4C

Logging Effects on Streamflow: Storm Runoff at Caspar Creek in Northwestern California.
W91-00610 4C

Logging Effects on Streamflow: Water Yield and Summer Low Flows at Caspar Creek in Northwestern California.
W91-00611 3B

LOGGING (RECORDING)
Evaluation of Hydrogeochemical Parameters with Spontaneous Potential Logs.
W91-00157 7B

Borehole Resistivity Logging in PVC Screened Well.
W91-00264 2F

LONG ISLAND
Availability and Historical Development of Ground-Water Resources of Long Island, New York--An Introduction.
W91-00345 2F

LONGSHORE CURRENTS
Longshore-Transport Model for South Indian and Sri Lankan Coasts.
W91-00176 2L

LOUISIANA
Hydroclimatic Application Strategy for the Poisson Partial Duration Model.
W91-00084 2E

Geohydrology and Simulated Effects of Pumpage on the New Orleans Aquifer System at New Orleans, Louisiana.
W91-00348 2F

LOUISVILLE
Effect of Preozonation on Trihalomethane and Total Organic Halogen Formation at the Louisville Water Company.
W91-00523 5F

LOW FLOW
Logging Effects on Streamflow: Water Yield and Summer Low Flows at Caspar Creek in Northwestern California.
W91-00611 3B

Regionalization of Low Flow Characteristics Using Logistic and GLS Regression.
W91-00993 2E

LYSIMETERS
Identification of Solubility-Controlling Solid Phases in a Large Fly Ash Field Lysimeter.
W91-00621 5B

MACROPHYTES
Macrophyte Associated Invertebrates and the Effect of Habitat Permanence.
W91-00052 2H

Effects of Nutrients and Water Levels on Emergent Macrophyte Biomass in a Prairie Marsh.
W91-00673 2H

MAGNESIUM
Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

MAHARASHTRA
Acquisition of Hydrogeologic Data for the Mapping of Shallow Unconfined Deccan Basaltic Aquifers from Maharashtra, India.
W91-00266 2F

MAINE
Hydrogeology and Water Quality of Significant Sand and Gravel Aquifers in Parts of Aroostook County, Maine: Significant Sand and Gravel Aquifer Maps 75, 76, 77, 78, 84, and 85.
W91-00435 2F

Sources of Water-Use Information in Maine.
W91-00443 6D

MAINTENANCE
Reducing Maintenance in a Water Treatment Plant.
W91-00629 5F

MALAYSIA
Heavy Metal Contamination in the River Toad, Bufo juxtasper (Inger), Near a Copper Mine in East Malaysia.
W91-00209 5B

MAMMALS
Mutagenic Activity of Concentrated Water Extracts in Cultured Mammalian Cells and Drosophila melanogaster.
W91-00495 5C

Association Between Chlorinated Drinking Water and Decreased Serum HDLc in Two Monkey Species During Dietary Atherogenic Stress.
W91-00498 5C

MANAGEMENT PLANNING
Competitive Assessment of the U.S. Water Resources Industry.
W91-00561 6D

Combined Sewer Overflow: A Management Study.
W91-00568 5D

Toward Empirical Estimation of the Total Value of Protecting Rivers.
W91-00584 6B

Benefits of an Irrigation Water Rental Market in a Saline Stream-Aquifer System.
W91-00586 3F

MANGANESE
Manganese Deposition in Chlorinated Power Plant Cooling Water.
W91-00518 5F

MANITOBA
Analysis of Geophysical Well Logs and Flowmeter Measurements in Boreholes Penetrating Subhorizontal Fracture Zones, Lac Du Bonnet Batholith, Manitoba, Canada.
W91-00354 2F

MANNINGS EQUATION
Reconstruction of the Recent Flow History of a Braided Gravel River.
W91-00079 2E

Guide for Selecting Manning's Roughness Coefficients for Natural Channels and Flood Plains.
W91-00335 2E

MAPPING
Some Fundamental Weak Spots of Kriging Technique and Their Consequences.
W91-00159 7C

SPOT and Environmental Studies: An Advanced System to Collect Up to Date Geographic Information.
W91-00793 7B

MAPS
Frequency Distributions of Heavy Rainstorms in Illinois.
W91-00553 2B

MARINAS
Slips Ahoy.
W91-00677 8A

MARINE ALGAE
Arsenic-induced Ultrastructural Changes in the Vegetative Cells of Cystoseira barbata forma repens Zinova et Kalugina (Fucophyceae, Fucales).
W91-00202 5C

MARINE ANIMALS
Ecology of Marine Benthic Dipterans in a Tidal Creek of Hooghly Estuary, Sagar Island, India.
W91-00051 2L

Macrofauna Distributions and Sediment Analyses from the Brunswick, Georgia Ocean Dredged Material Disposal Site and Environs.
W91-00444 5E

MARINE BACTERIA
Crude Oil and Hydrocarbon-degrading Strains of Rhodococcus rhodochrous Isolated from Soil and Marine Environments in Kuwait.
W91-00144 5B

Spectral Irradiance and Distribution of Pigments in a Highly Layered Marine Microbial Mat.
W91-00826 2L

MARINE ENVIRONMENT
Effects of Wastes on the Ocean: The Coastal Example.
W91-00385 5C

Detecting the Biological Effects of Deep-Sea Waste Disposal.
W91-00386 5A

Distribution and Correlation of Elements in Waters, Suspensions, Sediments, and Marine Organisms from the Black Sea.
W91-00797 5A

MARINE POLLUTION
Geochemical Study of Sediment Contamination in New Bedford Harbor, Massachusetts.
W91-00043 5B

Detecting the Biological Effects of Deep-Sea Waste Disposal.
W91-00386 5A

MARINE SEDIMENTS
Effects of Drill Cuttings on a Model Marine Sediment System.
W91-00044 5C

MARSH PLANTS
Comparison of Vesicular-Arbuscular Mycorrhizae in Plants from Disturbed and Adjacent Undisturbed Regions of a Coastal Salt Marsh in Clinton, Connecticut, USA.
W91-00029 2I

Effects of Nutrients and Water Levels on Species Composition in Prairie Whitetop (Scolochloa festucacea) Marshes.
W91-00674 2H

Ecology of a Mediterranean-Climate Estuarine Wetland at Carpinteria, California: Plant Distributions and Soil Salinity in the Upper Marsh.
W91-00675 2L

MARSHES
Effects of Nutrients and Water Levels on Emergent Macrophyte Biomass in a Prairie Marsh.
W91-00673 2H

MASS SPECTROMETRY
Determination of Gold at Femtomolar Levels in Natural Waters by Flow Injection Inductively Coupled Plasma Quadrupole Mass Spectrometry.
W91-00388 2K

MASSACHUSETTS
Geochemical Study of Sediment Contamination in New Bedford Harbor, Massachusetts.
W91-00043 5B

Computer-Operated Treatment Plant Provides Top Quality Water.
W91-00106 5F

Regional Flow-duration Curves for Ungauged Sites in Massachusetts.
W91-00185 2E

Hydrogeology and Simulation of Ground-Water Flow at Superfund-Site Wells G and H, Woburn, Massachusetts.
W91-00340 2F

Case-Control Study of Bladder Cancer in Massachusetts Among Populations Receiving Chlorinated and Chloraminated Drinking Water.
W91-00508 5C

MATERIALS TESTING
Strides in Nondestructive Testing.
W91-00676 8G

MATHEMATICAL ANALYSIS
Analysis of Pumping Test Data from Borewells in Fractured Rocks of Karnataka.
W91-00217 2F

Analysis of Test Pumping Data from Unconfined Aquifers by Simulation.
W91-00218 2F

Kriged Estimates of Water-Levels from the Sparse Measurements in a Hard Rock Aquifer.
W91-00245 2F

Evaluation of Automated Techniques for Base Flow and Recession Analyses.
W91-00593 2E

Analytical Solutions of the One-Dimensional Advection Equation and Two or Three-Dimensional Dispersion Equation.
W91-00594 5B

Fuzzy Regression in Hydrology.
W91-00596 7C

Specific Storage as a Poroelastic Coefficient.
W91-00607 2F

Capillarity Correction for Free Surface Flow Revisited.
W91-00614 4B

MATHEMATICAL EQUATIONS
Functional Relation for Capillary Suction vs. Moisture Content.
W91-00260 7C

MATHEMATICAL MODELS
Empirical Models for Predicting Water Quality, as Applied to Data on Lakes of Poland.
W91-00001 2H

Methods for Improving the Efficiency of Calibration of a Model of Phosphorus Cycling in a Lake Ecosystem.
W91-00004 2H

Mathematical Modelling of the Effect of Size Distribution on Suspended Particles in Deep-Bed Filtration.
W91-00022 5F

Depth-Integrated Model for Suspended Sediment Transport.
W91-00033 2J

Tides in the English Channel and Southern North Sea. A Frequency Domain Analysis Using Model TEA-NL.
W91-00045 2L

Comparison of Two Finite Element Models of Tidal Hydrodynamics Using a North Sea Data Set.
W91-00046 2L

Tidal Flow Simulation in the English Channel and Southern North Sea.
W91-00047 2L

Simulation of the Tidal Flow in the English Channel and the Southern North Sea by a Curvilinear Finite Difference Model.
W91-00048 2L

Three-Dimensional Analysis of Pressures on Dams.
W91-00057 8B

Nonlinear Hydrodynamic Pressure on Dams.
W91-00058 8B

Laterally Averaged Hydrodynamics Model for Reservoir Predictions.
W91-00062 2H

Dimensionless Analytical Solutions for Dam-Breach Erosion.
W91-00069 8A

One-Dimensional Model for the Transport of a Sediment Mixture in Non-Equilibrium Conditions.
W91-00070 2J

Water Waves Generated by Distant Landslides.
W91-00071 2H

Comprehensive Generalized Study of Scour at Cantilevered Pipe Outlets.
W91-00072 8B

Prediction of Flow Characteristics in Main Channel/Flood Plain Flows.
W91-00073 8B

Variable Lapse Rate Snowline Model for the Remarkables, Central Otago, New Zealand.
W91-00076 2C

Conversion of Braided Gravel-Bed Rivers to Single-Thread Channels of Equivalent Transport Capacity.
W91-00078 2J

Reconstruction of the Recent Flow History of a Braided Gravel River.
W91-00079 2E

PCG Solutions of Flow Problems in Random Porous Media Using Mixed Finite Elements.
W91-00117 2F

Modeling Infiltration in Hysteretic Soils.
W91-00118 2G

Theory of Subsurface Water-Borne Solute Transport.
W91-00119 5B

Numerical Model for Areal Migration of Water and Light Hydrocarbon in Unconfined Aquifers.
W91-00120 5B

Propagation of Periodic Waves in the Lido Channel of the Venice Lagoon.
W91-00121 2L

Variational Principle Method with Variable Domain in the Flow Problem with Free Surface.
W91-00122 8B

Three-Dimensional Boundary Element Reservoir Model for Seismic Analysis of Arch and Gravity Dams.
W91-00123 8D

Seismic Damage to Segmented Buried Pipelines.
W91-00124 8G

Simulation of Dispersion in Layered Coastal Aquifer Systems.

Estimation of Recharge and Pollutant Transfer to Groundwater by Modelling of Unsaturated Zone.
W91-00259 2F

Developing Accurate and Reliable Sediment Yields.
W91-00301 7C

Statistical Processor for Analyzing Simulations Made Using the Modular Finite-Difference Ground-Water Flow Model.
W91-00353 7C

Graphical Kernel System (GKS) Version of Computer Program MODPATH-PLOT for Displaying Path Lines Generated from the U.S. Geological Survey Three-Dimensional Ground-Water Flow Model.
W91-00361 7C

What Is a Leacher.
W91-00362 5B

Transport of Low-Concentration Contaminants in Saturated Earthen Barriers.
W91-00372 5E

Catastrophe Model for the Forced Hydraulic Jump.
W91-00373 8B

Locating and Identifying Hydraulic Controls for Layered Flow Over an Obstruction.
W91-00374 2L

State Space Approach to the Behavior of Sewer Systems.
W91-00375 5D

Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Exact Solution for Flow of Slightly Compressible Fluids Through Multiple-Porosity, Multiple-Permeability Media.
W91-00588 2F

Rainfall-Runoff Relations Derived from the Probability Theory of Storage.
W91-00592 2E

General Mass-Conservative Numerical Solution for the Unsaturated Flow Equation.
W91-00595 2G

Mathematical Modeling of Tracer Behavior in Short-Term Experiments in Fissured Rocks.
W91-00598 5B

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 1. Theory.
W91-00601 2F

Origin of Soluble Chemical Species in Bulk Precipitation Collected in Tokyo, Japan: Statistical Evaluation of Source Materials.
W91-00670 5B

Predicting Success of Walleye Stocking Programs in the United States and Canada.
W91-00691 8I

Evaluating the Probability of Violating Dissolved Oxygen Standard.
W91-00715 5G

Infiltration Under Ponded Conditions: 3. A Predictive Equation Based on Physical Parameters.
W91-00790 2G

Physics-Based Approach to Stochastic Hydrology of First-Order Drainage Basins.
W91-00968 2E

Use of Kinematic Wave Method to Assess Effects of Urban Development on Flood Peak Changes.
W91-00971 4C

Entropy Based Method for Flood Forecasting.
W91-00972 2E

Review of the Search for a Quantitative Link Between Hydrologic Response and Fluvial Geomorphology.
W91-00977 2E

Analytical Relationships Between Rainfall and Runoff for a Probability-Distributed Model of Basin Response.
W91-00980 2E

Modeling Snowfall-to-Snowmelt Delay.
W91-00982 2C

Operational Snow Accumulation and Snowmelt Modeling.
W91-00983 2B

MATHEMATICAL STUDIES
Fourier and Moment Methods Applied to Two-Dimensional Raindrop Images.
W91-00055 2B

PCG Solutions of Flow Problems in Random Porous Media Using Mixed Finite Elements.
W91-00117 2F

Mineralization, Pore Water Chemistry and Phosphorus Release from Peaty Sediments in the Eutrophic Loosdrecht Lakes, The Netherlands.
W91-00426 2H

Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

Perturbation Solution of the Flood-Routing Problem.
W91-00763 7C

Influence of Outliers on Results of Wet Deposition Measurements as a Function of Measurement Strategy.
W91-00849 5B

Source-Receptor Relationships for Wet SO4(2-) and NO3(-) Production.
W91-00851 5B

MEADOW RUN BASIN
Streamflow and Water-Quality Data for Meadow Run Basin, Fayette County, Pennsylvania, December 1987 - November 1988.
W91-00431 5B

MEASURING INSTRUMENTS
Effect of Irregularities in the Diameter Classification of Raindrops by the Joss-Waldvogel Disdrometer.
W91-00141 2B

Results of Qualification Tests on Water-Level Sensing Instruments, 1987.
W91-00356 7B

Soil-Gas Surveying for Subsurface Gasoline Contamination Using Total Organic Vapor Detection Instruments: Part I. Theory and Laboratory Experimentation.
W91-00368 5A

Investigating Septic Disposal Sites Using a Velocity Permeameter.
W91-00394 5D

Chlorine and Monochloramine Measurements Using a Pulsed Silver Iodide Electrode.
W91-00536 5A

Chloramine Interference in the Measurement of Free Chlorine by the Amperometric Membrane Electrode.
W91-00537 7B

Observations of Atmospheric Water Vapor with the SAGE II Instrument.
W91-00579 7B

Automated Determination of Silica in Surface and Ground Water (Die Outomatiese Bepaling van Silika in Oppervlak en Grondwater).
W91-00638 7B

Environmental Russian Roulette: Compliance at or Near the Detection Level.
W91-00802 5G

Comparison of Two Cloudwater/Fogwater Collectors: The Rotating Arm Collector and the Caltech Active Strand Cloudwater Collector.
W91-00844 7B

MEDICAL WASTES
Adsorption Removal of Cresol by Granular Activated Carbon for Medical Waste Water Treatment.
W91-00203 5D

MEDICINE BOW NATIONAL FOREST
Testing of Habitat Assessment Models for Small Trout Streams in the Medicine Bow National Forest, Wyoming.
W91-00014 8I

MEDITERRANEAN SEA
Comparative Data on Primary Productivity and Mineral Phosphorus Uptake in the Euphotic Zone of the Mediterranean and Black Sea.
W91-00710 2L

MEKONG RIVER BASIN
Daily Flow Forecasting with Regression Analysis.
W91-00634 2E

MEMBRANE PROCESSES
Cost and Performance of Membranes for Organic Control in Small Systems: Flagler Beach and Punta Gorda, Florida.
W91-00448 5F

SOC (Synthetic Organic Compounds) Rejection by Nanofiltration.
W91-00449 5F

Membrane Separation Technologies.
W91-00918 5D

MERCURY
Comparative Toxicity of an Effluent from a Chlor-Alkali Industry and HgCl2.
W91-00210 5C

Bioaccumulation of Mercury and Its Effect on Protein Metabolism of the Water Hyacinth Weevil Neochetina eichhornae (Warner).
W91-00212 5C

Using Seabirds to Monitor Mercury in Marine Environments: The Validity of Conversion Ratios for Tissue Comparisons.
W91-00704 5B

Determination of the Environmental Capacity of Haifa Bay with Respect to the Input of Mercury.
W91-00706 5B

MEROMICTIC LAKES
Vernal Microstratification Patterns in a Meromictic Saline Lake: Their Causes and Biological Significance.
W91-00745 2H

Production and Decomposition in a Saline Meromictic Lake.
W91-00746 2H

METAL COMPLEXES
Automated Preconcentration of Trace Metals from Seawater and Freshwater.
W91-00615 7B

METAL-FINISHING WASTES
Superfund Record of Decision: Independent Nail, SC.
W91-00446 5G

Superfund Record of Decision Midwest Manufacturing, IO.
W91-00556 5G

METALS
Metal Concentrations in Surficial Sediments from Hypersaline Lakes, Australia.
W91-00737 2K

Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

METAMORPHIC AQUIFERS
Hydrochemical Characterization of Groundwater Mixing in Sedimentary and Metamorphic Res-

ervoirs with Combined Use of Piper's Principle and Factor Analysis.
W91-00164 2K

METEOROLOGICAL DATA COLLECTION
Towards an Improved System for Weather Radar Calibration and Rainfall Forecasting Using Raingauge Data from a Regional Telemetry System.
W91-00963 2B

Use of Satellite Derived Rainfall Estimates as Inputs to Flow Prediction in the River Senegal.
W91-00964 2B

Areal Reduction Factors for Design Storm Construction: Joint Use of Raingauge and Radar Data.
W91-00965 2B

METEOROLOGY
Modelling Long-Term Rainfall Patterns in North-east England.
W91-00099 2B

Spatial and Temporal Variability of Precipitation Across Kentucky.
W91-00110 2B

Spatial Organisation of Daily Rainfall in Wales During Autumn-Winter.
W91-00115 2B

Remote Sensing and Large-Scale Global Processes.
W91-00454 7B

Physical Causes and Predictability of Variations in Seasonal Rainfall Over Sub-Saharan Africa.
W91-00464 2B

Potential Application of Satellite Data for Rainfall Estimation.
W91-00465 2B

Monitoring of Weather Conditions on Mesoscale to Improve a Precipitation Warning System for Hydrologic Purposes.
W91-00467 7B

Frequency Distributions of Heavy Rainstorms in Illinois.
W91-00553 2B

Effect of Global-Scale Divergent Circulation on the Atmospheric Water Vapor Transport and Maintenance.
W91-00577 2B

Cumulus Convection and Terrestrial Water-Vapor Distribution.
W91-00578 2B

Measurements of H2O in the Terrestrial Mesosphere and Implications for Extra-Terrestrial Sources.
W91-00580 2B

Rainfall Deficits: Distribution of Monthly Runs.
W91-00886 2B

Study on Short-term Rainfall Prediction by Radar Raingauge.
W91-00962 2B

ETHANE
Development of a New Methodology for the Assessment of Specific Methanogenic Activity.
W91-00805 5D

Effects of Anilines and Hydantoins on the Methanogenic Degradation of Selected Phenols.
W91-00818 5D

Variability of Biogenic Sulfur Flux from a Temperate Salt Marsh on Short Time and Space Scales.
W91-00847 2L

METHANOGENESIS
Development of a New Methodology for the Assessment of Specific Methanogenic Activity.
W91-00805 5D

Comparison of Media Types in Acetate Fed Expanded-Bed Anaerobic Reactors.
W91-00806 5D

METROPOLITAN WATER MANAGEMENT
Water Supply in Fast-Growing Cities: Tokyo, Japan.
W91-00021 6D

Effect of Drought on Urban Water Supplies. II: Water-Supply Analysis.
W91-00060 6D

MEXICO CITY
Water Supply for Mexico City.
W91-00020 3D

MICHIGAN
Ground-Water Data for Michigan 1988.
W91-00358 2F

MICROBIAL DEGRADATION
Activity and Adaptation of Nitrilotriacetate (NTA)-Degrading Bacteria: Field and Laboratory Studies.
W91-00811 5D

Dechlorination of Four Commercial Polychlorinated Biphenyl Mixtures (Aroclors) by Anaerobic Microorganisms from Sediments.
W91-00827 5B

Effect of Withdrawal of Morpholine from the Influent and Its Reinstatement on the Performance and Microbial Ecology of a Model Activated Sludge Plant Treating a Morpholine-Containing Influent.
W91-00874 5D

Instability of the Morpholine-Degradative Phenotype in Mycobacteria Isolated from Activated Sludge.
W91-00875 5D

MICROBIOLOGICAL STUDIES
Factors that Change Bacterial Resistance to Disinfection.
W91-00544 5F

Microbiological Investigations into an Outbreak of Pontiac Fever Due to Legionella micdadei Associated with Use of a Whirlpool.
W91-00840 5A

Incidence of Bdellovibrio spp. in Man-Made Water Systems: Coexistence with Legionellas.
W91-00876 5F

MICROBIOLOGY
Microbiological Perspective on Risks from Water Chlorination.
W91-00551 5F

MICROCOMPUTERS
Remote Data Collection and Control for Hydrogeologic Monitoring.
W91-00370 7B

Microcomputer Analysis of Pipe Networks.
W91-00630 5F

MICROORGANISMS
Emerging Issues for the Microbiology of Drinking Water.
W91-00627 5F

Seasonal Variation in the Structure of the Microbial Community Capable of Nitrate Respiration in an Intertidal Mud Flat Sediment from the Elbe Estuary.
W91-00650 2L

Lake Thetis, Western Australia: An Example of Saline Lake Sedimentation Dominated by Benthic Microbial Processes.
W91-00655 2H

Porewater Mixing by Microorganisms, Monitored by a Radiotracer Method.
W91-00693 2J

Effect of Withdrawal of Morpholine from the Influent and Its Reinstatement on the Performance and Microbial Ecology of a Model Activated Sludge Plant Treating a Morpholine-Containing Influent.
W91-00874 5D

MICROTUNNELING
Microtunneling Techniques Aid Sewer Installation.
W91-00773 8A

MICROWAVES
Use of Satellite Microwave Radiometers for Large-Scale Hydrology.
W91-00457 7B

Relationships Between the Hydrologic Balance of a Small Watershed and Remotely Sensed Soil Moisture.
W91-00463 2A

MIDGES
Influence of pH, Temperature and Sediment Type on the Toxicity, Accumulation and Degradation of Parathion in Aquatic Systems.
W91-00193 5B

Benthic Turfs vs Floating Mats of Algae in River Food Webs.
W91-00708 2H

MIDWEST MANUFACTURING SITE
Superfund Record of Decision Midwest Manufacturing, IO.
W91-00556 5G

MINE DISPOSAL
Disposal in Mines and Salt Domes.
W91-00953 5E

MINE WASTES
Heavy Metal Contamination in the River Toad, Bufo juxtasper (Inger), Near a Copper Mine in East Malaysia.
W91-00209 5B

Transport of Mine Tailings as Suspended Sediment in the Belle Fourche River, West-Central South Dakota, USA.
W91-00283 5B

Metal Dispersal in the Fluvial System of the River Geul: The Role of Discharge, Distance to the Source, and Floodplain Geometry.
W91-00286 5B

Placer Mining Operations and Modifications of the Physical Chemical Nature of the Waters of the Rio Kaka Drainage Basin (Andes, Bolivia).
W91-00293 5B

Relationships Between Copper Concentrations in Larvae of Plectrocnemia conspersa (Curtis) (Trichoptera) and in Mine Drainage Streams.
W91-00859 5B

Mining Wastes.
W91-00911 5E

MINERALIZATION
Mineralization, Pore Water Chemistry and Phosphorus Release from Peaty Sediments in the Eutrophic Loosdrecht Lakes, The Netherlands.
W91-00426 2H

MINNESOTA
Flooding Controlled by Bridge Relocation.
W91-00105 4A

Water Resources of the White Earth Indian Reservation, Northwestern Minnesota.
W91-00341 5F

MINNESOTA RIVER BASIN
Hydrologic and Water-Quality Data for Streams and Impoundments in the Coteau des Prairies--Upper Minnesota River Basin, 1979-84.
W91-00434 2E

MIRES
Periodic Moisture Fluctuation as a Factor Affecting Mire Vegetation.
W91-00644 2H

Constant or Increasing Nitrogen Concentrations in Sphagnum Mosses on Mires in Southern Sweden During the Last Few Decades.
W91-00645 2H

Divergent Successions in Mires, a Comparative Study.
W91-00646 2H

Synopsis and Numerical Analysis of the Pre-, Sub-, and Low-Alpine Mire Vegetation of the Uleberg-Skrubben Area, North Norway.
W91-00647 2H

MISSISSIPPI
Channel and Bank Stability of Osborne Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00437 2J

Channel and Bank Stability of Twentymile Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00439 2J

MISSISSIPPI RIVER
Hysteresis and Nonlinearity of Discharge-Sediment Relationships in the Atchafalaya and Lower Mississippi Rivers.
W91-00292 2J

MISSOURI
Hydrologic Parameter Effects on Small-Dam Risk Analysis in Missouri.
W91-00167 8A

Hydrogeologic Investigations Sampling Plan.
W91-00557 7A

MISSOURI RIVER
Effect of Toston Dam on Upstream Ice Conditions.
W91-00574 6G

MIXING
Qualitative and Numerical Analyses of the Effects of River Inflow Variations on Mixing Diagrams in Estuaries.
W91-00720 2L

Autumnal Mixing in Mahoney Lake, British Columbia.
W91-00747 2H

MODEL STUDIES
Simulation Model of Phosphorus Cycling in the Epilimnion of a Eutrophic Lake.
W91-00003 2H

Methods for Improving the Efficiency of Calibration of a Model of Phosphorus Cycling in a Lake Ecosystem.
W91-00004 2H

Testing of Habitat Assessment Models for Small Trout Streams in the Medicine Bow National Forest, Wyoming.
W91-00014 8I

Algorithm for Routing Unsteady Flows in Urban Drainage Networks.
W91-00031 4C

Depth-Integrated Model for Suspended Sediment Transport.
W91-00033 2J

Effects of Drill Cuttings on a Model Marine Sediment System.
W91-00044 5C

Tides in the English Channel and Southern North Sea. A Frequency Domain Analysis Using Model TEA-NL.
W91-00045 2L

Comparison of Two Finite Element Models of Tidal Hydrodynamics Using a North Sea Data Set.
W91-00046 2L

Tidal Flow Simulation in the English Channel and Southern North Sea.
W91-00047 2L

Simulation of the Tidal Flow in the English Channel and the Southern North Sea by a Curvilinear Finite Difference Model.
W91-00048 2L

Three-Dimensional Analysis of Pressures on Dams.
W91-00057 8B

Effect of Drought on Urban Water Supplies. I: Drought Analysis.
W91-00059 6D

Effect of Drought on Urban Water Supplies. II: Water-Supply Analysis.
W91-00060 6D

Air Entrainment by Spillway Aerators.
W91-00061 8B

Laterally Averaged Hydrodynamics Model for Reservoir Predictions.
W91-00062 2H

Three-Dimensional Scale Model of Ground-Water Solute Transport.
W91-00064 5B

Dimensionless Analytical Solutions for Dam-Breach Erosion.
W91-00069 8A

One-Dimensional Model for the Transport of a Sediment Mixture in Non-Equilibrium Conditions.
W91-00070 2J

Water Waves Generated by Distant Landslides.
W91-00071 2H

Comprehensive Generalized Study of Scour at Cantilevered Pipe Outlets.
W91-00072 8B

Prediction of Flow Characteristics in Main Channel/Flood Plain Flows.
W91-00073 8B

Groundwater Modelling as a Tool for Water Management: Waimea Plains, Nelson.
W91-00075 2F

Variable Lapse Rate Snowline Model for the Remarkables, Central Otago, New Zealand.
W91-00076 2C

Stream-Channel Incision Following Drainage-Basin Urbanization.
W91-00082 4C

Hydroclimatic Application Strategy for the Poisson Partial Duration Model.
W91-00084 2E

Errors in Estimated Streamflow Parameters and Storages for Ungauged Catchments.
W91-00085 2E

Targeting Remedial Measures to Control Non-point Source Pollution.
W91-00090 5G

Temporal Lag Effect in Bed Load Sediment Transport.
W91-00093 2J

Prediction of Entrainment Conditions for Non-uniform, Noncohesive Sediments.
W91-00094 2J

Modelling Long-Term Rainfall Patterns in North-east England.
W91-00099 2B

PCG Solutions of Flow Problems in Random Porous Media Using Mixed Finite Elements.
W91-00117 2F

Modeling Infiltration in Hysteretic Soils.
W91-00118 2G

Theory of Subsurface Water-Borne Solute Transport.
W91-00119 5B

Numerical Model for Areal Migration of Water and Light Hydrocarbon in Unconfined Aquifers.
W91-00120 5B

Propagation of Periodic Waves in the Lido Channel of the Venice Lagoon.
W91-00121 2L

Three-Dimensional Boundary Element Reservoir Model for Seismic Analysis of Arch and Gravity Dams.
W91-00123 8D

State Estimation in Wastewater Engineering: Application to an Anaerobic Process.
W91-00130 5D

One-dimensional Interactive Soil-atmosphere Model for Testing Formulations of Surface Hydrology.
W91-00145 2A

Menu of Coupled Velocity and Sediment-discharge Relations for Rivers.
W91-00149 2J

Stability Limits for Preissmann's Scheme.
W91-00150 2E

Explicit Methods for 2-D Transient Free-surface Flows.
W91-00151 2E

Design of Stable Alluvial Channels.
W91-00154 2J

Radar Rainfall Forecasting Method Designed for Hydrological Purposes.
W91-00156 7B

Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

Estimating Groundwater Recharge Using a Surface Watershed Modelling Approach.
W91-00160 2F

Estimating Groundwater Recharge Using a Surface Watershed Model: Sensitivity Analyses.
W91-00161 7C

Simulation of Land Use Changes and Impacts on the Water Balance: A Case Study for Belgium.
W91-00162 4C

Evaluation of Three Evapotranspiration Models in Terms of Their Applicability for an Arid Region.
W91-00165 2D

Drip Irrigation Nonlinear Optimization Model.
W91-00168 3F

Unsteady Drawdown of Water Table.
W91-00170 2F

Model of Flow in Regulated Open-channel Networks.
W91-00172 2E

Streamflow Simulation Using Deterministic Model.
W91-00174 2E

Rainfall-Reaeration Effects.
W91-00175 2A

2-D Bed Evolution in Natural Watercourses: New Simulation Approach.
W91-00177 2J

Optimal Planning and Operation of Multiaquifer System.
W91-00179 4B

Two-stage Ground-water Remediation Design.
W91-00184 5G

Regional Flow-duration Curves for Ungauged Sites in Massachusetts.
W91-00185 2E

Optimization of Freshwater Inflow to Estuaries.
W91-00187 2L

Modeling the Effect of Algal Biomass on Multispecies Aquatic Microcosms Response to Copper Toxicity.
W91-00197 5C

Parameter Estimation for a Quasi-Three-Dimensional Flow Model.
W91-00236 7C

Fracture Pattern Modelling for Groundwater Targetting in Hard Rock Terrain: A Study Aided by Remote Sensing Technique.
W91-00250 7C

Estimation of Recharge and Pollutant Transfer to Groundwater by Modelling of Unsaturated Zone.
W91-00259 2F

Hillslope and Channel Sediment Delivery and Impacts of Soil Erosion on Water Resources.
W91-00300 2J

Developing Accurate and Reliable Sediment Yields.
W91-00301 7C

Modelling Agricultural Runoff: Overview.
W91-00302 5B

Physical Habitat Simulation and Sedimentation.
W91-00303 4C

Using a Geographic Information System to Develop a Ground-Water Flow Model.
W91-00316 2F

Significance of Sediment Transport in Arroyo Development.
W91-00346 2J

Geohydrology and Simulated Effects of Pumpage on the New Orleans Aquifer System at New Orleans, Louisiana.
W91-00348 2F

Statistical Processor for Analyzing Simulations Made Using the Modular Finite-Difference Ground-Water Flow Model.
W91-00353 7C

SOLINPUT: A Computer Code to Create and Modify Input Files for the Geochemical Program SOLMINEQ.88.
W91-00359 7C

Graphical Kernel System (GKS) Version of Computer Program MODPATH-PLOT for Displaying Path Lines Generated from the U.S. Geological Survey Three-Dimensional Ground-Water Flow Model.
W91-00361 7C

Transport of Low-Concentration Contaminants in Saturated Earthen Barriers.
W91-00372 5E

Catastrophe Model for the Forced Hydraulic Jump.
W91-00373 8B

Locating and Identifying Hydraulic Controls for Layered Flow Over an Obstruction.
W91-00374 2L

State Space Approach to the Behavior of Sewer Systems.
W91-00375 5D

Simulation of One-Dimensional Dam-Break Flows.
W91-00399 8A

Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Spatial Allocation Factor Procedures for the 1980 NAPAP (National Acid Precipitation Assessment Program) Emissions Inventory Documentation.
W91-00453 5B

Effects of Climate Change on Snowmelt Runoff Patterns.
W91-00458 2C

Relationships Between the Hydrologic Balance of a Small Watershed and Remotely Sensed Soil Moisture.
W91-00463 2A

Physical Causes and Predictability of Variations in Seasonal Rainfall Over Sub-Saharan Africa.
W91-00464 2B

Hydrological Effects of Catchment Characteristics and Land Use Changes Determined by Satellite Imagery and GIS.
W91-00472 2A

Development and Calibration of a Model for Predicting Optimum Chlorination Scenarios for Biofouling Control.
W91-00516 5C

Modeling the Impact of Nitrogenous Compounds on Wastewater Disinfection.
W91-00546 5D

Qualitative Validation of Pollutant Transport Components of an Unsaturated Soil Zone Model (SESOIL).
W91-00573 5B

Users Manual for the SLUDGEMAN Model for the Groundwater Pathway in the Monofilling of Sewage Sludge.
W91-00575 5E

Exact Solution for Flow of Slightly Compressible Fluids Through Multiple-Porosity, Multiple-Permeability Media.
W91-00588 2F

Rainfall-Runoff Relations Derived from the Probability Theory of Storage.
W91-00592 2E

Analytical Solutions of the One-Dimensional Advection Equation and Two or Three-Dimensional Dispersion Equation.
W91-00594 5B

General Mass-Conservative Numerical Solution for the Unsaturated Flow Equation.
W91-00595 2G

Fuzzy Regression in Hydrology.
W91-00596 7C

Mathematical Modeling of Tracer Behavior in Short-Term Experiments in Fissured Rocks.
W91-00598 5B

Modeling the Movement of Volatile Organic Chemicals in Columns of Unsaturated Soil.
W91-00599 5B

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 1. Theory.
W91-00601 2F

Efficient Deterministic-Probabilistic Approach to Modeling Regional Groundwater Flow: 2. Application to Owens Valley, California.
W91-00602 2F

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 1. Models, Model Properties, and Experimental Design.
W91-00604 2A

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 2. Hydrologic Responses for Normal and Extreme Rainfall.
W91-00605 2A

Model of Organic Chemical Uptake and Clearance by Fish from Food and Water.
W91-00622 5B

Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

Use of Extant Populations of Scaled Chrysophytes for the Inference of Lakewater pH.
W91-00658 5A

Mesoscale Modeling of Acidity Production in Orographic Clouds and Rain.
W91-00671 5B

Effective Modelling of a Major Inland Oil Spill on the Ohio River.
W91-00714 5B

Steady Uniform Flow in Prismatic Channels with Flood Plains.
W91-00761 2E

Effect of Daytime Surface Evaporation on Pollution Dispersion.
W91-00848 5B

Mathematical Modelling of Sea Water Intrusion, Nauru Island.
W91-00865 2L

Transpiration of Plantation Pinus radiata Estimated by the Heat Pulse Method and the Bowen Ratio.
W91-00867 2D

Effects of Faults on Fluid Flow and Chloride Contamination in a Carbonate Aquifer System.
W91-00877 2F

MODEL STUDIES

Non-Linear System to Describe Movements of Water Masses at the LG-2 Reservoir (La Grande, Quebec).
W91-00885 2H

Rainfall Deficits: Distribution of Monthly Runs.
W91-00886 2B

Relative Performance of a Soil Moisture Accounting Model in Estimating Return Flow.
W91-00887 2G

Topographic Effects on Flow Path and Surface Water Chemistry of the Llyn Brianne Catchments in Wales.
W91-00888 2E

Evaluation and Prediction of Possible Man-Induced Changes in the Hydrological Cycle.
W91-00967 4C

Physics-Based Approach to Stochastic Hydrology of First-Order Drainage Basins.
W91-00968 2E

Influence of the Angle of Incidence of the Rainfall on the Overland Flow Process.
W91-00969 2J

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

Use of Kinematic Wave Method to Assess Effects of Urban Development on Flood Peak Changes.
W91-00971 4C

Entropy Based Method for Flood Forecasting.
W91-00972 2E

Assessment of Network Models in Flood Forecasting.
W91-00973 2E

Real-Time Intercomparison of Hydrological Models.
W91-00974 2A

Modelling of Hydrological Processes for a Mountainous Basin.
W91-00976 2A

Review of the Search for a Quantitative Link Between Hydrologic Response and Fluvial Geomorphology.
W91-00977 2E

Regionalization of Model Parameters for a Large Watershed.
W91-00979 2E

Analytical Relationships Between Rainfall and Runoff for a Probability-Distributed Model of Basin Response.
W91-00980 2E

Conceptual Model Simulating the Hydrological Processes on a Drainage Basin in a Plain Area.
W91-00981 2E

Modeling Snowfall-to-Snowmelt Delay.
W91-00982 2C

Operational Snow Accumulation and Snowmelt Modeling.
W91-00983 2B

New Perspectives on Developments in Modeling of Effective Rainfall by Applying the FDTF Method (Nouvelles Perspectives de Developpement dans la Modelisation des Pluies Efficases par Application de la Methode DPFT).
W91-00985 2E

Determination of Design Flood Hydrographs Based on Regional Hydrological Data.
W91-00987 2E

Regional Analysis of the Mean Annual Flood and of Flood Frequency Characteristics.
W91-00988 2E

Droughts and Floods: Their Definition and Modeling.
W91-00992 2E

Regionalization of Low Flow Characteristics Using Logistic and GLS Regression.
W91-00993 2E

Characteristics of Streamflow Drought.
W91-00994 2E

Development and Application of Simple Water Balance Models to Understand the Relationship Between Climate and Water Resources.
W91-00995 2A

Generalized Components of Complex Decision Support Systems for Water Resources Management in River Basins.
W91-00997 4A

Real Time Simulation Model as a Decision Support System for Surface Water Management.
W91-00998 4A

Object-Oriented Hydrological Modelling (Modelisation Hydrologique Orientee Object).
W91-00999 2A

Deriving Stream Parameters for Hydrologic Modeling from Digital Elevation Data.
W91-01000 2E

Intelligent Geographic Information Systems (IGIS) and Surface Water Modeling.
W91-01001 4A

EXSRM, an Expert System for Snowmelt Runoff Model (SRM).
W91-01002 2E

Using GIS to Assess Spatial Variability of SCS Curve Number at the Basin Scale.
W91-01004 2E

MODSIM MODEL

Effect of Drought on Urban Water Supplies. II: Water-Supply Analysis.
W91-00060 6D

MOLLUSKS

Effects of Low pH and Low Calcium Concentration on the Pulmonate Snail Planorbella trivolvis: A Laboratory Study.
W91-00838 5C

MOLTEN-GLASS PROCESSES

Molten-Glass Processes.
W91-00937 5D

MONITORING

Auditing the Quality of Effluent Discharges.
W91-00127 5G

Time Series Analysis of Unequally Spaced Observations-With Applications to Copper Contamination of the River Gaula in Central Norway.
W91-00128 5B

Some Comments on Analysis Techniques for Censored Water Quality Data.
W91-00131 5G

Status of the Niagara River Point Source Discharge Information: Sampling Design and Estimation of Loading.
W91-00134 5B

Inferences About Point Source Loading from Upstream/Downstream River Monitoring Data.
W91-00135 5B

Measures of Flow Variability for Great Lakes Tributaries.
W91-00136 2E

Development of a Software Package for Trend Detection in Temporal Series: Application to Water and Industrial Effluent Quality Data for the St. Lawrence River.
W91-00139 5B

High Water Level Installation of Monitoring Wells for Underground Storage Tanks.
W91-00364 5G

Proposal to Use Chlorine-36 for Monitoring the Movement of Radionuclides from Nuclear Explosions.
W91-00366 5A

Remote Data Collection and Control for Hydrogeologic Monitoring.
W91-00370 7B

Biomonitoring of Chemicals on Tropical Ecosystems.
W91-00823 5B

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

Sampling and Monitoring of Remedial-Action Sites.
W91-00955 5A

MONITORING WELLS

Some Fundamental Weak Spots of Kriging Technique and Their Consequences.
W91-00159 7C

Remote-Sensing Application to Well Monitoring.
W91-00169 2F

High Water Level Installation of Monitoring Wells for Underground Storage Tanks.
W91-00364 5G

MONOCHLORAMINE

Effect of Drinking Water Containing Chlorine and Monochloramine on Cholesterol and Triglyceride Levels in the Liver of the Pigeon and Rabbit.
W91-00500 5C

MONONGAHELA RIVER

Effective Modelling of a Major Inland Oil Spill on the Ohio River.
W91-00714 5B

MONTANA

Channel Changes at Cross Sections of the Powder River Between Moorhead and Broadus, Montana, 1975-88.
W91-00436 2J

Assessing Options for Stream Regulation Using Hydrologic Simulations and Cumulative Impact Analysis: Flathead River Basin, USA.
W91-00779 2E

MORINGA SEEDS

Improving the Sludge Conditioning Potential of Moringa Seed.
W91-00028 5D

MORPHOLINE

Effect of Withdrawal of Morpholine from the Influent and Its Reinstatement on the Performance and Microbial Ecology of a Model Activated Sludge Plant Treating a Morpholine-Containing Influent.
W91-00874 5D

Instability of the Morpholine-Degradative Phenotype in Mycobacteria Isolated from Activated Sludge.

MOSES LAKE
Moses Lake Clean Lake Project. Final Stage 3 Report.
W91-00554 5G

MOUNTAIN STREAMS
Hydrologic and Hydraulic Research in Mountain Rivers.
W91-00083 2E

Interactions Among Nutrients, Algae and Invertebrates in a New Zealand Mountain Stream.
W91-00422 2E

Sediment Yield and Discharge in Mountainous Small River Basins: Actual Condition of Sediment Discharge After Damage Caused by Sand and Stone Avalanches (in Japanese).
W91-00766 2J

Modelling of Hydrological Processes for a Mountainous Basin.
W91-00976 2A

MOUNTAINS
Effects of Climate Change on Snowmelt Runoff Patterns.
W91-00458 2C

Radar Data Processing for Hydrology in the Cevennes Region.
W91-00466 7B

MULTIPHASE FLOW
Numerical Model for Areal Migration of Water and Light Hydrocarbon in Unconfined Aquifers.
W91-00120 5B

MULTIVARIATE ANALYSIS
Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

MUNICIPAL WATER
Water Supply for Mexico City.
W91-00020 3D

Chlorinated Hydrocarbons and Water Quality Issues in the New York City Municipal Water Supply.
W91-00481 5F

MUNITIONS WASTES
Closure of an Unlined Evaporation Pond: A Case History.
W91-00855 5G

MUSSELS
Estimating the Carrying Capacity of a Coastal Inlet for Mussel Culture.
W91-00666 2L

Influence of Sewage Pollution on a Rocky Intertidal Community Dominated by the Mytilid Brachidontes rodriguezi.
W91-00764 5C

MUTAGENICITY
Genotoxicity of Drinking Water: Significance and Future Approach.
W91-00023 5C

MUTAGENS
Age-dependent Changes in Toxicity of N-Nitroso Compounds to Japanese Medaka (Oryzias latipes) Embryos.
W91-00194 5C

Comparison of Mutagenic Activity of Chlorinated Aquatic and Commercial Humic Substances.
W91-00488 5C

Comparison of Drinking Water Disinfectants Using Mutagenicity Testing.
W91-00493 5F

Organic Reactions of Chlorine Dioxide in Drinking Water-A Mutagenic Assessment.
W91-00494 5F

Mutagenic Activity of Concentrated Water Extracts in Cultured Mammalian Cells and Drosophila melanogaster.
W91-00495 5C

Evaluation of Protocol for Preparing Drinking Water Samples for Ames Mutagenicity Testing.
W91-00496 5A

MYCOBACTERIUM
Instability of the Morpholine-Degradative Phenotype in Mycobacteria Isolated from Activated Sludge.
W91-00875 5D

NATIONAL ACID PRECIPITATION ASSESSMENT
Spatial Allocation Factor Procedures for the 1980 NAPAP (National Acid Precipitation Assessment Program) Emissions Inventory Documentation.
W91-00453 5B

NATIONAL ASSOCIATION OF ENVIRONMENTAL P
National Association of Environmental Professionals--Certification Program.
W91-00275 6E

NATIONAL WATER INFORMATION SYSTEM
National Water Information System User's Manual Volume 2, Chapter 3. Automated Data Processing System.

Availability and Historical Development of Ground-Water Resources of Long Island, New York--An Introduction.
W91-00345 2F

Chlorinated Hydrocarbons and Water Quality Issues in the New York City Municipal Water Supply.
W91-00481 5F

Episodic Acidification of Adirondack Lakes During Snowmelt.
W91-00608 5B

Relationships Between Acidity and Benthic Invertebrates of Low-Order Woodland Streams in the Adirondack Mountains, New York.
W91-00657 5C

NEW ZEALAND
Interactions Among Nutrients, Algae and Invertebrates in a New Zealand Mountain Stream.
W91-00422 2E

NIAGARA RIVER
Estimation of Phosphorus from the Niagara River to Lake Ontario.
W91-00133 5E

Status of the Niagara River Point Source Discharge Information: Sampling Design and Estimation of Loading.
W91-00134 5B

NICARAGUA
Littoral Benthic Fauna of Lake Managua, Nicaragua: A Study Comparing Artificial and Natural Substrata.
W91-00681 2H

NICKEL
Gonadal Histopathology Following Nickel Intoxication in the Giant Gaurami Colisa fasciatus (Bloch and Schneider), a Freshwater Tropical Perch.
W91-00213 5C

Effects of Nickel on Daphnia Magna During Chronic Exposure and Alterations in the Toxicity to Generations Pre-Exposed to Nickel.
W91-00808 5C

NILE RIVER
Monitoring Lake Nasser by Space Sensing.
W91-00473 7B

NITRATES
Posttreatment Effects of Forest Fertilization on the Predominant Benthic Community of a Headwater Stream in Eastern Kentucky.
W91-00109 5C

Using Isotope Fractionation of Nitrate-Nitrogen and Nitrate-Oxygen for Evaluation of Microbial Denitrification in a Sandy Aquifer.
W91-00166 5B

Water and Nitrogen Management in Central Platte Valley of Nebraska.
W91-00173 3F

Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

Seasonal Variation in the Structure of the Microbial Community Capable of Nitrate Respiration in an Intertidal Mud Flat Sediment from the Elbe Estuary.
W91-00650 2L

Source-Receptor Relationships for Wet SO4(2-) and NO3(-) Production.
W91-00851 5B

Simulation of Nitrate Nitrogen Breakthrough Curves Stemming from Leaching of Ammonium Nitrate Through Soil.
W91-00896 5B

NITRIC ACID
Phytoplankton Communities of Lakes Experimentally Acidified with Sulfuric and Nitric Acids.
W91-00659 5C

Atmospheric Chemistry of Peroxides: A Review.
W91-00841 5B

NITRIFICATION
Detection and Analysis of Two Serotypes of Ammonia-Oxidizing Bacteria in Sewage Plants by Flow Cytometry.
W91-00831 5D

Carbon and Nitrogen Transformations in Wastewater During Treatment with Hydrocotyle umbellata L.
W91-00834 5D

NITRILOTRIACETIC ACID
Activity and Adaptation of Nitrilotriacetate (NTA)-Degrading Bacteria: Field and Laboratory Studies.
W91-00811 5D

NITROGEN
Water and Nitrogen Management in Central Platte Valley of Nebraska.
W91-00173 3F

Effect of Nitrogen Limitation on Pelletisation in Upflow Anaerobic Sludge Bed Systems.
W91-00632 5D

Phosphorus and Nitrogen Limitation of Phytoplankton Growth in the Freshwaters of North America: A Review and Critique of Experimental Enrichments.
W91-00664 2H

Transformation and Transport of Ammonium Nitrogen in a Flooded Organic Soil.
W91-00716 5B

NITROGEN COMPOUNDS
Influence of Organic Nitrogen Compounds on the Production of Organochlorine Compounds in the Chlorination of Humic Material.
W91-00534 5F

Modeling the Impact of Nitrogenous Compounds on Wastewater Disinfection.
W91-00546 5D

Simultaneous Determination of Nitrites, Nitrates and Amines by Ion-Interaction Reversed-Phase High-Performance Liquid Chromatography.
W91-00728 5A

NITROGEN CYCLE
Nitrous Oxide Dissolved in Soil Solution: An Insignificant Pathway of Nitrogen Loss from a Southeastern Hardwood Forest.
W91-00613 2G

Nitrogenous Nutrient Transformations in the Spring and Fall in the Chesapeake Bay.
W91-00718 2L

NITROGEN ISOTOPES
Natural Isotopic Composition of Dissolved Organic Nitrogen in the Chesapeake Bay.
W91-00719 2L

NITROGEN REMOVAL
Comparison of Growth and Nutrient Removal Efficiency of Chlorella pyrenoidosa in Settled and Activated Sewages.
W91-00857 5D

NITROSO COMPOUNDS
Age-dependent Changes in Toxicity of N-Nitroso Compounds to Japanese Medaka (Oryzias latipes) Embryos.
W91-00194 5C

NITROUS OXIDE
Nitrous Oxide Dissolved in Soil Solution: An Insignificant Pathway of Nitrogen Loss from a Southeastern Hardwood Forest.
W91-00613 2G

NIZAMABAD
Role of Hydrogeological Set Up in the Yield of Wells in Granite Terrain: Case Histories of Nizamabad, Warangal and Hindupur Areas.
W91-00253 2F

NOMOGRAPHS
Effect of Oblique Rain on Inclined Surfaces: A Nomograph for the Rain-Gauge Correction Factor.
W91-00899 7B

NONDESTRUCTIVE TESTS
Strides in Nondestructive Testing.

Transport and Sedimentation of Pollutants in a River Reach: A Chemical Mass Balance Approach.
W91-00600 5B

Water Quality in the Barycz River and Its Tributaries Within the Area of the Low Silesian Commercial Fishery Farm in Milicz (Jakosc Wody Rzeki Baryczy i Jej Doplywow na Obsazarze Dolnoslaskiego Kombinatu Rybackiego).
W91-00734 5B

State Agricultural Pollution Regulation: A Quantitative Analysis.
W91-00801 5G

Simulation of Nitrate Nitrogen Breakthrough Curves Stemming from Leaching of Ammonium Nitrate Through Soil.
W91-00896 5B

NONUNIFORM FLOW

Depth-Integrated Model for Suspended Sediment Transport.
W91-00033 2J

NORTH AFRICA

Physical Causes and Predictability of Variations in Seasonal Rainfall Over Sub-Saharan Africa.
W91-00464 2B

NORTH CAROLINA

Hydrologic and Chemical-Quality Data from Four Rural Basins in Guilford County, North Carolina, 1985-88.
W91-00433 5B

Hydrogeologic and Water-Quality Data from Well Clusters Near the Wastewater-Treatment Plant, U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-00438 5B

NORTH DAKOTA

Water Resources Data Collected During Water Year 1988 at Selected James River Basin Sites in North Dakota and South Dakota.
W91-00342 6G

NORTH HUDSON PARK LAKE

Lake Restoration Project, North Hudson Park Lake, Bergen, New Jersey.
W91-00563 5G

NORTH PARK LAKE

Dredging of North Park Lake, County of Allegheny, Pennsylvania.
W91-00564 5G

NORTH SEA

Tides in the English Channel and Southern North Sea. A Frequency Domain Analysis Using Model TEA-NL.
W91-00045 2L

Comparison of Two Finite Element Models of Tidal Hydrodynamics Using a North Sea Data Set.
W91-00046 2L

Tidal Flow Simulation in the English Channel and Southern North Sea.
W91-00047 2L

Simulation of the Tidal Flow in the English Channel and the Southern North Sea by a Curvilinear Finite Difference Model.
W91-00048 2L

Wet and Dry Deposition Fluxes Above the North Sea.
W91-00845 2B

NORWAY

Time Series Analysis of Unequally Spaced Observations-With Applications to Copper Contamination of the River Gaula in Central Norway.
W91-00128 5B

Synopsis and Numerical Analysis of the Pre-, Sub-, and Low-Alpine Mire Vegetation of the Uleberg-Skrubben Area, North Norway.
W91-00647 2H

Effects of Changes in Sewage Pollution on Soft-Bottom Macrofauna Communities in the Inner Oslofjord, Norway.
W91-00788 5C

NOVA SCOTIA

Plasma Electrolytes, Gill Aluminum Content, and Gill Morphology of Juvenile Atlantic Salmon (Salmo salar) and Brook Trout (Salvelinus fontinalis) Indigenous to Acidic Streams of Nova Scotia.
W91-00616 5C

NUCLEAR EXPLOSIONS

Proposal to Use Chlorine-36 for Monitoring the Movement of Radionuclides from Nuclear Explosions.
W91-00366 5A

NUMERICAL ANALYSIS

PCG Solutions of Flow Problems in Random Porous Media Using Mixed Finite Elements.
W91-00117 2F

Explicit Methods for 2-D Transient Free-surface Flows.
W91-00151 2E

Model of Flow in Regulated Open-channel Networks.
W91-00172 2E

NUTRIENT CONCENTRATIONS

Arsenate Sensitivity in Marine Periphyton Communities Established Under Various Nutrient Regimes.
W91-00700 5C

Survey of the Protein Content in Estuarine Waters.
W91-00795 2L

NUTRIENT REMOVAL

Herculean Labors to Clean Wastewater.
W91-00387 5D

Comparison of Growth and Nutrient Removal Efficiency of Chlorella pyrenoidosa in Settled and Activated Sewages.
W91-00857 5D

NUTRIENT TRANSPORT

Transformation and Transport of Ammonium Nitrogen in a Flooded Organic Soil.
W91-00716 5B

Nutrient Dynamics of Decomposing Leaves from Amazonian Floodplain Forest Species in Water.
W91-00824 2H

NUTRIENTS

Interactions Among Nutrients, Algae and Invertebrates in a New Zealand Mountain Stream.
W91-00422 2E

Nutrient Status of Ombrotrophic Peat Bogs.
W91-00640 2H

Constant or Increasing Nitrogen Concentrations in Sphagnum Mosses on Mires in Southern Sweden During the Last Few Decades.
W91-00645 2H

Retention and Resuspension of Phosphorus, Nitrogen, and Iron in a Central Ontario Lake.
W91-00656 2H

Influence of Upwellings, Storms, and Generating Station Operation on Water Chemistry and Plankton in the Nanticoke Region of Long Point Bay, Lake Erie.
W91-00662 2H

Phosphorus and Nitrogen Limitation of Phytoplankton Growth in the Freshwaters of North America: A Review and Critique of Experimental Enrichments.
W91-00664 2H

Effects of Nutrients and Water Levels on Emergent Macrophyte Biomass in a Prairie Marsh.
W91-00673 2H

Effects of Nutrients and Water Levels on Species Composition in Prairie Whitetop (Scolochloa festucacea) Marshes.
W91-00674 2H

Comparative Data on Primary Productivity and Mineral Phosphorus Uptake in the Euphotic Zone of the Mediterranean and Black Sea.
W91-00710 2L

Some Preliminary Data on the Nutrient Influx into the Western Black Sea.
W91-00712 5B

Nutrients in Pore Waters from Dead Sea Sediments.
W91-00742 2H

Control of Phytoplankton Growth in Nutrient Recycling Ecosystems. Theory and Terminology.
W91-00765 2H

Nutrient Dynamics of Decomposing Leaves from Amazonian Floodplain Forest Species in Water.
W91-00824 2H

Iron-Binding Compounds and Related Outer Membrane Proteins in Vibrio cholerae Non-O1 Strains from Aquatic Environments.
W91-00830 5B

OBSERVATION WELLS

Some Fundamental Weak Spots of Kriging Technique and Their Consequences.
W91-00159 7C

OCEAN DUMPING
Effects of Wastes on the Ocean: The Coastal Example.
W91-00385 5C

OCEANIC INCINERATION
Oceanic Incineration.

Optimization of Freshwater Inflow to Estuaries.
W91-00187 2L

OREGON
Geochemistry of Iron in a Sand Dune Aquifer, Near Coos Bay and North Bend, Oregon.
W91-00430 2K

ORGANIC ACIDS
Field Investigations on the Snow Chemistry in Central and Southern California-I. Inorganic Ions and Hydrogen Peroxide.
W91-00842 5B

Field Investigations on the Snow Chemistry in Central and Southern California-II. Carbonyls and Carboxylic Acids.
W91-00843 5B

Intensive Studies of Sierra Nevada Cloudwater Chemistry and Its Relationship to Precursor Aerosol and Gas Concentrations.
W91-00846 2B

ORGANIC COMPOUNDS
Production of Organic Chemicals and Mutagens during Chlorination of Amino Acids in Water.
W91-00485 5F

Identification of the Strong Mutagen 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone and Its Geometric Isomer E-2-Chloro-3-(dichloromethyl)-4-oxobutenoic Acid in Mutagenic Fractions of Chlorine-Treated Humic Water and in Drinking Waters.
W91-00487 5F

Correlations Between Measurements of Organic Halide and Specific Halogenated Volatile Organic Compounds in Contaminated Groundwater.
W91-00528 5B

Identification of Organic N-Chloramines in Wastewater.
W91-00533 5A

Qualitative Validation of Pollutant Transport Components of an Unsaturated Soil Zone Model (SESOIL).
W91-00573 5B

Model of Organic Chemical Uptake and Clearance by Fish from Food and Water.
W91-00622 5B

Determination of Resin and Fatty Acids in Pulp and Paper Mill Effluents and White Waters by Gas-Liquid Chromatography.
W91-00726 5A

Use of Membrane Extraction Disks for On-Line Trace Enrichment of Organic Compounds from Aqueous Samples.
W91-00839 5A

ORGANIC MATTER
Proposed Mechanism for the Reactions of Chlorine Dioxide with Aquatic Organic Materials.
W91-00541 5F

Isolation of Dissolved Organic Matter from the Suwannee River Using Reverse Osmosis.
W91-00816 5B

ORGANOCHLORINE PESTICIDES
Bioaccumulation of Kepone by Grass Shrimp (Palaemonetes pugio): Importance of Dietary Accumulation and Food Ration.
W91-00201 5B

ORGANOPHOSPHORUS PESTICIDES
In Vitro Inhibition of Acetylcholinesterase from Four Marine Species by Organophosphates and Carbamates.
W91-00206 5A

OROGRAPHIC PRECIPITATION
Mesoscale Modeling of Acidity Production in Orographic Clouds and Rain.
W91-00671 5B

OSBORNE CREEK
Channel and Bank Stability of Osborne Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00437 2J

OSTRACODS
Distribution Patterns of Ostracods in Iberian Saline Lakes. Influence of Ecological Factors.
W91-00753 2H

OUSE RIVER
Effect of Regulation on 0+ Fish Recruitment in the Great Ouse, A Lowland River.
W91-00777 6G

OVERLAND FLOW
Influence of the Angle of Incidence of the Rainfall on the Overland Flow Process.
W91-00969 2J

OWENS VALLEY
Estimates of Evapotranspiration in Alkaline Scrub and Meadow Communities of Owens Valley, California, Using the Bowen-Ratio, Eddy-Correlation, and Penman-Combination Methods.
W91-00333 2D

OXIDATION
Destruction of Hazardous Chemical Waste by Oxidation in Supercritical Water.
W91-00450 5D

Oxidation of S(IV) in Rain-Water Collected in Japan.
W91-00668 5B

Chemical Oxidation and Reduction.
W91-00925 5D

Wet Oxidation.
W91-00934 5D

Deep-Shaft Wet-Air Oxidation.
W91-00938 5D

Supercritical-Water Oxidation.
W91-00939 5D

OXYGEN
Measurements of Gas Concentration Fluctuations at Water Surface.
W91-00065 2K

Solubility of Oxygen in the Dead Sea Brine.
W91-00744 2K

Commercial Oxygen Use in Water-Quality Management.
W91-00770 5D

OXYGEN ISOTOPES
Using Isotope Fractionation of Nitrate-Nitrogen and Nitrate-Oxygen for Evaluation of Microbial Denitrification in a Sandy Aquifer.
W91-00166 5B

Chemical Studies of Chloride and Stable Oxygen Isotopes in Two Conifer Afforested and Moorland Sites in the British Uplands.
W91-00890 2D

Method to Extract Soil Water for Stable Isotope Analysis.
W91-00898 2G

OXYGEN REQUIREMENTS
Estimation of the Critical Oxygen Tension for and Recovering Capabilities of Red Tilapia (Oreochromis niloticus X Oreochromis mossambicus) Hybrids.
W91-00683 2H

OXYGEN TRANSFER
Increase in the Oxygen Concentration in Amazon Waters Resulting from the Root Exudation of Two Notorious Water Plants, Eichhornia crassipes (Pontederiaceae) and Pistia stratiotes (Araceae).
W91-00822 2H

OXYGEN UPTAKE
Estimation of the Critical Oxygen Tension for and Recovering Capabilities of Red Tilapia (Oreochromis niloticus X Oreochromis mossambicus) Hybrids.
W91-00683 2H

OXYGENATION
Rainfall-Reaeration Effects.
W91-00175 2A

Commercial Oxygen Use in Water-Quality Management.
W91-00770 5D

OYSTERS
Field Evaluation of the Effect of Chlorinated Treated Sewage on Settlement of Oysters (Crassostrea virginica Gmelin) and Barnacles (Balanus sp).
W91-00511 5C

Incidence of Vibrio parahaemolyticus in U.S. Coastal Waters and Oysters.
W91-00825 5B

OZONATION
Effect of Preozonation on Trihalomethane and Total Organic Halogen Formation at the Louisville Water Company.
W91-00523 5F

Ozonation of Alachlor: Effects and Suitability as a Treatment Technology.
W91-00543 5F

Ozonation.
W91-00927 5D

PALEOCLIMATOLOGY
Global Water Balance and Global Climate Model in the Pleistocene.
W91-00459 2C

Comparative Development of Bogs and Fens in Central Sweden: Evaluating the Role of Climate Change and Ecosystem Development.
W91-00641 2H

PALEOECOLOGY
Vegetation and Paleoecology of a Bog Complex in S Finland.
W91-00642 2H

PALEOHYDROLOGY
Hydrologic and Hydraulic Research in Mountain Rivers.
W91-00083 2E

Global Water Balance and Global Climate Model in the Pleistocene.
W91-00459 2C

Palaeoflood Hydrology: A Tool for South Africa--An Example from the Crocodile River near Brits, Transvaal, South Africa.
W91-00636 2E

PALEOLIMNOLOGY
Use of Extant Populations of Scaled Chrysophytes for the Inference of Lakewater pH.
W91-00658 5A

Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

PALEOZOIC ROCKS
Geophysically Determined Porosity of Paleozoic Rocks in the Upper Colorado River Basin.
W91-00314 2F

Porosity and Permeability of the Paleozoic Rocks in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00315 2F

PARAMETRIC HYDROLOGY
One-dimensional Interactive Soil-atmosphere Model for Testing Formulations of Surface Hydrology.
W91-00145 2A

PARASITES
Human Activities Leading to Contact with Water in a Schistosomiasis Endemic Area, Southwest Saudi Arabia: Preliminary Observations.
W91-00678 5C

PARATHION
Influence of pH, Temperature and Sediment Type on the Toxicity, Accumulation and Degradation of Parathion in Aquatic Systems.
W91-00193 5B

PARTICLE SIZE
Mathematical Modelling of the Effect of Size Distribution on Suspended Particles in Deep-Bed Filtration.
W91-00022 5F

Concentration of Very Fine Silts in a Steady Vortex.
W91-00035 2J

Experimental Investigation of Size Distribution of Suspended Particles in Granular Bed Filtration.
W91-00819 5F

PATH OF POLLUTANTS
Geochemical Study of Sediment Contamination in New Bedford Harbor, Massachusetts.
W91-00043 5B

Effects of Drill Cuttings on a Model Marine Sediment System.
W91-00044 5C

Three-Dimensional Scale Model of Ground-Water Solute Transport.
W91-00064 5B

Theory of Subsurface Water-Borne Solute Transport.
W91-00119 5B

Numerical Model for Areal Migration of Water and Light Hydrocarbon in Unconfined Aquifers.
W91-00120 5B

Time Series Analysis of Unequally Spaced Observations-With Applications to Copper Contamination of the River Gaula in Central Norway.
W91-00128 5B

Estimation of Phosphorus from the Niagara River to Lake Ontario.
W91-00133 5E

Inferences About Point Source Loading from Upstream/Downstream River Monitoring Data.
W91-00135 5B

Statistical Zonation of Sediment Samples Using Ratio Matching and Cluster Analysis.
W91-00137 2J

Acid Precursor Concentrations Above the Northeastern United States during Summer 1987: Three Case Studies.
W91-00148 5B

Influence of pH, Temperature and Sediment Type on the Toxicity, Accumulation and Degradation of Parathion in Aquatic Systems.
W91-00193 5B

Bioaccumulation of Kepone by Grass Shrimp (Palaemonetes pugio): Importance of Dietary Accumulation and Food Ration.
W91-00201 5B

Potential for Agricultural Pesticide Runoff to a Puget Sound Estuary: Padilla Bay, Washington.
W91-00204 5B

Heavy Metal Contamination in the River Toad, Bufo juxtasper (Inger), Near a Copper Mine in East Malaysia.
W91-00209 5B

Bioaccumulation of Mercury and Its Effect on Protein Metabolism of the Water Hyacinth Weevil Neochetina eichhornae (Warner).
W91-00212 5C

Estimation of Recharge and Pollutant Transfer to Groundwater by Modelling of Unsaturated Zone.
W91-00259 2F

Computer Simulation of an Injected Tracer Movement.
W91-00262 2F

Sediment and the Environment.
W91-00280 2J

Role of Sediment in Metolachlor Transport from Agricultural Fields.
W91-00282 5B

Transport of Mine Tailings as Suspended Sediment in the Belle Fourche River, West-Central South Dakota, USA.
W91-00283 5B

Sediment-Associated Transport and Redistribution of Chernobyl Fallout Radionuclides.
W91-00285 5B

Metal Dispersal in the Fluvial System of the River Geul: The Role of Discharge, Distance to the Source, and Floodplain Geometry.
W91-00286 5B

Flocculation of Suspended Solids in Southern Ontario Rivers.
W91-00291 2J

Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-00336 5B

Hydrogeology and Ground-Water-Quality Conditions at the Geary County Landfill, Northeast Kansas, 1988.
W91-00338 5B

Storm Runoff and its Effects on the Water Quality and Bottom-Material Quality of Cedar Creek, West-Central Illinois, 1985-6.
W91-00339 5B

Hydrogeology and Simulation of Ground-Water Flow at Superfund-Site Wells G and H, Woburn, Massachusetts.
W91-00340 2F

What Is a Leacher.
W91-00362 5B

Subsurface Transport of Inorganic and Organic Solutes from Experimental Road Spreading of Oil-Field Brine.
W91-00365 5B

Proposal to Use Chlorine-36 for Monitoring the Movement of Radionuclides from Nuclear Explosions.
W91-00366 5A

Ground Water Recharge and Pollution Potential of Dry Wells in Pima County, Arizona.
W91-00367 5B

Modeling the Potential Effect of Additives on Enhancing the Solubility of Aromatic Solutes Contained in Gasoline.
W91-00369 5B

Effects of Wastes on the Ocean: The Coastal Example.
W91-00385 5C

Detecting the Biological Effects of Deep-Sea Waste Disposal.
W91-00386 5A

Bacterial Pollution of the River Tigris.
W91-00392 5B

Hydrogeologic and Water-Quality Data from Well Clusters Near the Wastewater-Treatment Plant, U.S. Marine Corps Air Station, Cherry Point, North Carolina.
W91-00438 5B

Hydrologic and Chemical Data from Selected Wells and Springs in Southern Elmore County, Including Mountain Home Air Force Base, Southwestern Idaho, Fall 1989.
W91-00440 5B

Fate and Transport of Petroleum Released from Underground Storage Tanks.
W91-00452 5B

Measurement of Chlorine Residuals in Chlorinated Cooling Waters: Effect of Organic Nitrogen.
W91-00517 5B

Trihalomethane Formation and Distribution in Bromide-Rich and Ammonia-Containing Lake Water.
W91-00526 5B

Chlorinated Organic By-products of the Reaction of N-Chloropiperidine with Stomach Fluid from Laboratory Animals.
W91-00538 5B

Some Physical and Chemical Characteristics of an Unidentified Product of Inorganic Chloramine Decomposition.
W91-00539 5F

Proposed Mechanism for the Reactions of Chlorine Dioxide with Aquatic Organic Materials.
W91-00541 5F

Hydrolysis Constants of Chlorine Monoxide and Bromine Chloride in Water.
W91-00542 5B

Hydrogeologic Investigations Sampling Plan.
W91-00557 7A

Interactions of Contaminants with Sediment and Water in Reservoirs.
W91-00560 5B

Qualitative Validation of Pollutant Transport Components of an Unsaturated Soil Zone Model (SESOIL).
W91-00573 5B

Users Manual for the SLUDGEMAN Model for the Groundwater Pathway in the Monofilling of Sewage Sludge.
W91-00575 5E

Cokriging to Assess Regional Stream Quality in the Southern Blue Ridge Province.
W91-00589 5B

Comparative Analysis of Aluminum Biogeochemistry in a Northeastern and a Southeastern Forested Watershed.
W91-00590 2K

Analytical Solutions of the One-Dimensional Advection Equation and Two or Three-Dimensional Dispersion Equation.
W91-00594 5B

Mathematical Modeling of Tracer Behavior in Short-Term Experiments in Fissured Rocks.
W91-00598 5B

Modeling the Movement of Volatile Organic Chemicals in Columns of Unsaturated Soil.
W91-00599 5B

Transport and Sedimentation of Pollutants in a River Reach: A Chemical Mass Balance Approach.
W91-00600 5B

Episodic Acidification of Adirondack Lakes During Snowmelt.
W91-00608 5B

Contaminant Dissolution and Diffusional Transport with a Stationary Precipitation Front.
W91-00612 5E

Measurement of In Situ Rates of Selenate Removal by Dissimilatory Bacterial Reduction in Sediments.
W91-00620 5B

Identification of Solubility-Controlling Solid Phases in a Large Fly Ash Field Lysimeter.
W91-00621 5B

Model of Organic Chemical Uptake and Clearance by Fish from Food and Water.
W91-00622 5B

Fluorescent Polycyclic Aromatic Hydrocarbons as Probes for Studying the Impact of Colloids on Pollutant Transport in Groundwater.
W91-00623 5B

Po210 and Pb210 Remobilization from Lake Sediments in Relation to Iron and Manganese Cycling.
W91-00624 5B

Fate of Aquatic and Wetland Habitats in an Industrially Contaminated Section of the Elbe Floodplain in Hamburg.
W91-00648 5B

Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

Oxidation of S(IV) in Rain-Water Collected in Japan.
W91-00668 5B

Wet Deposition of Volcanic Gases and Ash in the Vicinity of Mount Sakurajima.
W91-00669 5B

Origin of Soluble Chemical Species in Bulk Precipitation Collected in Tokyo, Japan: Statistical Evaluation of Source Materials.
W91-00670 5B

Resistance to Antibiotics and Heavy Metals of Pseudomonas aeruginosa Isolated from Natural Waters.
W91-00698 5C

Heavy Metals Distribution and Enrichment in the Sediments of Southern East Coast of India.
W91-00701 5B

Beach Tar Contamination in Jamaica.
W91-00702 5B

Determination of the Environmental Capacity of Haifa Bay with Respect to the Input of Mercury.
W91-00706 5B

Effective Modelling of a Major Inland Oil Spill on the Ohio River.
W91-00714 5B

Transformation and Transport of Ammonium Nitrogen in a Flooded Organic Soil.
W91-00716 5B

Long-term Survival of and Plasmid Stability in Pseudomonas and Klebsiella Species and the Appearance of Nonculturable Cells in Agricultural Drainage Water.
W91-00733 5B

Effects of Changes in Sewage Pollution on Soft-Bottom Macrofauna Communities in the Inner Oslofjord, Norway.
W91-00788 5C

Radioactivity Level of Black Sea Marine Algae Before and After the Chernobyl Accident.
W91-00796 5B

Distribution and Correlation of Elements in Waters, Suspensions, Sediments, and Marine Organisms from the Black Sea.
W91-00797 5A

Water Masses and Eutrophication in a Greek Anoxic Marine Bay.
W91-00798 5B

Urban Storm-Induced Discharge Impacts.
W91-00803 4A

Distribution and Transport of Sediment-Bound Metal Contaminants in the Rio Grande de Tarcoles, Costa Rica (Central America).
W91-00804 5A

Incidence of Vibrio parahaemolyticus in U.S. Coastal Waters and Oysters.
W91-00825 5B

Field Investigations on the Snow Chemistry in Central and Southern California-I. Inorganic Ions and Hydrogen Peroxide.
W91-00842 5B

Field Investigations on the Snow Chemistry in Central and Southern California-II. Carbonyls and Carboxylic Acids.
W91-00843 5B

Intensive Studies of Sierra Nevada Cloudwater Chemistry and Its Relationship to Precursor Aerosol and Gas Concentrations.
W91-00846 2B

Influence of Outliers on Results of Wet Deposition Measurements as a Function of Measurement Strategy.
W91-00849 5B

Chemical Characterization of Acid Precipitation in Albany, New York.
W91-00850 5A

Source-Receptor Relationships for Wet SO4(2-) and NO3(-) Production.
W91-00851 5B

Trace Metal Wet Deposition in Sweden: Insight Gained from Daily Wet Only Collection.
W91-00853 5B

Release of Heavy Metals from Snowpacks on the Japan Sea Side of Japan.
W91-00858 5B

Relationships Between Copper Concentrations in Larvae of Plectrocnemia conspersa (Curtis) (Trichoptera) and in Mine Drainage Streams.
W91-00859 5B

Movement and Fate of Atrazine and Bromide in Central Kansas Croplands.
W91-00882 5B

Simulation of Nitrate Nitrogen Breakthrough Curves Stemming from Leaching of Ammonium Nitrate Through Soil.
W91-00896 5B

PATHOGENIC BACTERIA

Emerging Issues for the Microbiology of Drinking Water.
W91-00627 5F

Detection of Vibrio cholerae O1 in the Aquatic Environment by Fluorescent-Monoclonal Antibody and Culture Methods.
W91-00828 5A

Iron-Binding Compounds and Related Outer Membrane Proteins in Vibrio cholerae Non-O1 Strains from Aquatic Environments.
W91-00830 5B

PEAT

Mineralization, Pore Water Chemistry and Phosphorus Release from Peaty Sediments in the Eutrophic Loosdrecht Lakes, The Netherlands.
W91-00426 2H

Preservation of Plant Polymers in Peat and Liberation of Their Monomers Due to Artificial Drainage.
W91-00643 2H

PEAT BOGS

Nutrient Status of Ombrotrophic Peat Bogs.
W91-00640 2H

Comparative Development of Bogs and Fens in Central Sweden: Evaluating the Role of Climate Change and Ecosystem Development.
W91-00641 2H

PEAT SOILS

Spectroscopic Investigations of Peat-Water Interactions: An ESR, FT-IR, and NMR Study.
W91-00789 2H

PENNSYLVANIA

Streamflow and Water-Quality Data for Little Scrubgrass Creek Basin, Venango and Butler Counties, Pennsylvania, December 1987 - November 1988.
W91-00357 2E

Streamflow and Water-Quality Data for Meadow Run Basin, Fayette County, Pennsylvania, December 1987 - November 1988.
W91-00431 5B

Dredging of North Park Lake, County of Allegheny, Pennsylvania.
W91-00564 5G

PERCH

Gill Lesions in the Perch, Anabas testudineus, Subjected to Sewage Toxicity.
W91-00205 5C

Gonadal Histopathology Following Nickel Intoxication in the Giant Gaurami Colisa fasciatus (Bloch and Schneider), a Freshwater Tropical Perch.
W91-00213 5C

PERFORMANCE EVALUATION

Results of Qualification Tests on Water-Level Sensing Instruments, 1987.
W91-00356 7B

PERIODIC WAVES

Propagation of Periodic Waves in the Lido Channel of the Venice Lagoon.
W91-00121 2L

PERIPHYTON

Resource Limitation in a Stream Community: Phosphorus Enrichment Effects on Periphyton and Grazers.
W91-00618 2H

Arsenate Sensitivity in Marine Periphyton Communities Established Under Various Nutrient Regimes.
W91-00700 5C

PERMEABILITY

Pumping Test in a Low Permeability Claystone Aquifer Executed with High-Resolution Electronic Water Level Recorders and Evaluated with the Versatile Computer Program HYDROPAR.
W91-00216 2F

Porosity and Permeability of the Paleozoic Rocks in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00315 2F

PERMEAMETERS

Investigating Septic Disposal Sites Using a Velocity Permeameter.
W91-00394 5D

PESTICIDE DRIFT

What Is a Leacher.
W91-00362 5B

PESTICIDES

Treatment Options for Water Supplies Contaminated with DBCP and Other Pesticides.
W91-00103 5F

Potential for Agricultural Pesticide Runoff to a Puget Sound Estuary: Padilla Bay, Washington.
W91-00204 5B

Effects of Deltamethrin and Ethanol on Survival, and Mechanical Response of Daphnia spinulata.
W91-00208 5C

What Is a Leacher.
W91-00362 5B

Automated High-Performance Liquid Chromatography for the Determination of Pesticides in Water Using Solid Phase Extraction.
W91-00390 5A

SOC (Synthetic Organic Compounds) Rejection by Nanofiltration.
W91-00449 5F

Pesticides in Ground Water Data Base: 1988 Interim Report.
W91-00569 5B

Pesticides and Wetlands Overseas: A Framework for Mitigating Adverse Impacts.
W91-00570 5G

Determination of Warfarin in Drinking Water by High-Performance Liquid Chromatography after Solid-Phase Extraction.
W91-00723 5A

Biomonitoring of Chemicals on Tropical Ecosystems.
W91-00823 5B

Movement and Fate of Atrazine and Bromide in Central Kansas Croplands.
W91-00882 5B

PETROLEUM PRODUCTS

Soil-Gas Surveying for Subsurface Gasoline Contamination Using Total Organic Vapor Detection Instruments: Part I. Theory and Laboratory Experimentation.
W91-00368 5A

Modeling the Potential Effect of Additives on Enhancing the Solubility of Aromatic Solutes Contained in Gasoline.
W91-00369 5B

PHENOLS

Adsorption Removal of Cresol by Granular Activated Carbon for Medical Waste Water Treatment.
W91-00203 5D

Behavioral Changes in Gammarus pulex and Its Significance in the Toxicity Assessment of Very Low Levels of Environmental Pollutants.
W91-00207 5C

Biodegradation Kinetics of Substituted Phenolics: Demonstrations of a Protocol Based on Electrolytic Respirometry.
W91-00809 5B

Effects of Anilines and Hydantoins on the Methanogenic Degradation of Selected Phenols.
W91-00818 5D

Degradation of Polyphenols in Five Plant Species in the Aquatic Environment (Degradacao de Ploifenois em Cinco Especies Vegetais em Ambientes Aquaticos).
W91-00821 2H

Bacteria Degrading Phenolic Acids Isolated on a Polymeric Phenolic Pigment.
W91-00873 5D

PHOSPHATASES

Study of Phosphatase Activity in Anaerobic Sludge Digestion.
W91-00817 5D

PHOSPHATES
Influence of Salinity on the Concentration and Rate of Interchange of Dissolved Phosphate between Water and Sediment in Fuente Piedra Lagoon (S. Spain).
W91-00743 2L

PHOSPHORUS
Empirical Models for Predicting Water Quality, as Applied to Data on Lakes of Poland.
W91-00001 2H

Numerical Model of Phosphorus Exchange Between the Sediments and the Near-Bottom Water in a Lake.
W91-00002 2H

Simulation Model of Phosphorus Cycling in the Epilimnion of a Eutrophic Lake.
W91-00003 2H

Methods for Improving the Efficiency of Calibration of a Model of Phosphorus Cycling in a Lake Ecosystem.
W91-00004 2H

Evaluation of Phosphorus Loads from Ontario Municipal Wastewater Treatment Plants.
W91-00132 5D

Estimation of Phosphorus from the Niagara River to Lake Ontario.
W91-00133 5E

Mineralization, Pore Water Chemistry and Phosphorus Release from Peaty Sediments in the Eutrophic Loosdrecht Lakes, The Netherlands.
W91-00426 2H

Resource Limitation in a Stream Community: Phosphorus Enrichment Effects on Periphyton and Grazers.
W91-00618 2H

Potential Bio-available Phosphorus in Sediments of the River Elbe in Northern Germany.
W91-00651 2L

Phosphorus and Nitrogen Limitation of Phytoplankton Growth in the Freshwaters of North America: A Review and Critique of Experimental Enrichments.
W91-00664 2H

Comparative Data on Primary Productivity and Mineral Phosphorus Uptake in the Euphotic Zone of the Mediterranean and Black Sea.
W91-00710 2L

PHOSPHORUS REMOVAL
Reduction of Phosphorus and Chlorophyll a Concentrations Following CaCO3 and Ca(OH)2 Additions to Hypereutrophic Figure Eight Lake, Alberta, Canada.
W91-00625 5F

PHOTOLYSIS
Photolysis.
W91-00924 5D

PHOTOSYNTHESIS
Arsenate Sensitivity in Marine Periphyton Communities Established Under Various Nutrient Regimes.
W91-00700 5C

Photosynthesis of Dunaliella parva Lerche as a Function of Temperature, Light and Salinity.
W91-00750 2H

PHOTOTROPISM
Spectral Irradiance and Distribution of Pigments in a Highly Layered Marine Microbial Mat.
W91-00826 2L

PHYSICAL MODELS
New Directions for Surface Water Modeling.
W91-00961 7C

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

PHYSICAL PROPERTIES
Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Physical Chemical Properties of Uncharged Water Clusters and One-Dimensional Ice Based on Quantal Calculations.
W91-00667 2C

PHYSICOCHEMICAL PROPERTIES
Benthic Macrofauna and Ancillary Data for San Francisco Bay, California, January to November 1988.
W91-00343 2L

Distribution of Micro-Arthropods in Some Southern English Streams: The Influence of Physicochemistry.
W91-00419 2H

Physicochemistry and Vegetation of Piccaninnie Ponds, a Coastal Aquifer-Fed Pond in Southeastern South Australia.
W91-00653 2H

Water Chemistry of the Solimoes/Amazon River (A Hidroquimica do Rio Solimoes/Amazonas).
W91-00820 2K

PHYSICOCHEMICAL TREATMENT
Alternate Technologies for Wastewater Treatment.
W91-00403 5D

Solidification and Stabilization Technology.
W91-00929 5D

PHYTOPLANKTON
Methods for Improving the Efficiency of Calibration of a Model of Phosphorus Cycling in a Lake Ecosystem.
W91-00004 2H

Phosphorus and Nitrogen Limitation of Phytoplankton Growth in the Freshwaters of North America: A Review and Critique of Experimental Enrichments.
W91-00664 2H

Microphytoplankton of Upwelling Coastal Waters (State of Rio de Janeiro): List of Species and Ecological Aspects (O Microfitoplancton das Aguas Costeiras do Litoral Fluminense (Estado do Rio de Janeiro)): Lista de Especies e Aspectos Ecologicos.
W91-00689 2L

Natural Isotopic Composition of Dissolved Organic Nitrogen in the Chesapeake Bay.
W91-00719 2L

Control of Phytoplankton Growth in Nutrient Recycling Ecosystems. Theory and Terminology.
W91-00765 2H

PHYTOTOXICITY
Determination of Borate at Trace Levels in Environmental Samples by Ion-Exclusion Chromatography.
W91-00725 5A

PIERS
Local Scour Around Bridge Piers.
W91-00397 2J

PIGMENTS
Pigment Stratigraphy and Trophic Status: An Evaluation of Radionuclide-Dated Lacustrine Sediment.
W91-00692 2H

Spectral Irradiance and Distribution of Pigments in a Highly Layered Marine Microbial Mat.
W91-00826 2L

PINE TREES
Transpiration of Plantation Pinus radiata Estimated by the Heat Pulse Method and the Bowen Ratio.
W91-00867 2D

PIPE FLOW
Modified Element Method for Pipe Network Analysis.
W91-00398 8B

PIPELINES
Seismic Damage to Segmented Buried Pipelines.
W91-00124 8G

PIPES
Comprehensive Generalized Study of Scour at Cantilevered Pipe Outlets.
W91-00072 8B

Seismic Damage to Segmented Buried Pipelines.
W91-00124 8G

Siphon Quenches.
W91-00142 8A

Modified Element Method for Pipe Network Analysis.
W91-00398 8B

Stainless Steel in Wastewater Treatment Plants.
W91-00628 5D

Microcomputer Analysis of Pipe Networks.
W91-00630 5F

PLANKTON
Short-Term Productivity Responses of Algae and Bacteria to Zooplankton Grazing in Two Freshwater Lakes.
W91-00418 2H

Responses of Zooplankton and Zoobenthos to Experimental Acidification in a High-Elevation Lake (Sierra Nevada, California, U.S.A).
W91-00425 5C

Nitrogenous Nutrient Transformations in the Spring and Fall in the Chesapeake Bay.
W91-00718 2L

PLANNING
Effect of Drought on Urban Water Supplies. II: Water-Supply Analysis.
W91-00060 6D

Present and Future Perspectives of Water Resources in Developed Countries.
W91-00067 6A

Hydrology and Management of Drought in the United States.
W91-00991 2E

PLANT GROWTH
Effects of Nutrients and Water Levels on Species Composition in Prairie Whitetop (Scolochloa festucacea) Marshes.
W91-00674 2H

Vegetative Growth of Spirodela polyrrhiza as Affected by Medium Concentration, Daylight Intensity and Age.
W91-00684 2H

Effect of Water Depth and Clipping Frequency on the Growth and Survival of Four Wetland Plant Species.
W91-00836 2J

PLANT PHYSIOLOGY
Degradation of Polyphenols in Five Plant Species in the Aquatic Environment (Degradacao de Ploifenois em Cinco Especies Vegetais em Ambientes Aquaticos).
W91-00821 2H

Increase in the Oxygen Concentration in Amazon Waters Resulting from the Root Exudation of Two Notorious Water Plants, Eichhornia crassipes (Pontederiaceae) and Pistia stratiotes (Araceae).
W91-00822 2H

Interception Loss and Rainfall Redistribution by Three Semi-Arid Growing Shrubs in Northeastern Mexico.
W91-00878 2I

PLASMA SYSTEMS
Plasma Systems.
W91-00940 5D

PLASMAVARC
Plasma Systems.
W91-00940 5D

PLASMIDS
Instability of the Morpholine-Degradative Phenotype in Mycobacteria Isolated from Activated Sludge.
W91-00875 5D

PLASTICS
Reducing Maintenance in a Water Treatment Plant.
W91-00629 5F

PLATTE RIVER
Decision-Making Process on the Danube and the Platte.
W91-00088 6B

PLATYHELMINTHES
Predation on and by Pelagic Turbellaria in Some Lakes in Brazil.
W91-00695 2H

PLAYAS
Sediment Storage and Movement on the Southern High Plains of Texas as Indicated by Beryllium-Ten.
W91-00299 2J

Sediment-Water Interaction as a Control on Geochemical Evolution of Playa Lake Systems in the Australian Arid Interior.
W91-00736 2H

PLUMBING
Corrosion and Water Quality.
W91-00411 5B

PMS PROBES
Fourier and Moment Methods Applied to Two-Dimensional Raindrop Images.
W91-00055 2B

POINT-OF-ENTRY WATER TREATMENT
Point-of-Entry Drinking Water Treatment Systems for Superfund Applications.
W91-00572 5F

POISSON RATIO
Hydroclimatic Application Strategy for the Poisson Partial Duration Model.
W91-00084 2E

POLAND
Numerical Model of Phosphorus Exchange Between the Sediments and the Near-Bottom Water in a Lake.
W91-00002 2H

Simulation Model of Phosphorus Cycling in the Epilimnion of a Eutrophic Lake.
W91-00003 2H

Methods for Improving the Efficiency of Calibration of a Model of Phosphorus Cycling in a Lake Ecosystem.
W91-00004 2H

Development and Structure of the Goczalkowice Reservoir Ecosystem. XIX. Suspended-Matter Sedimentation.
W91-00005 2H

Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

Populations, Growth, Biomass and Production of Fish in a Small Stream in North-West Poland.
W91-00007 2H

Water Quality in the Barycz River and Its Tributaries Within the Area of the Low Silesian Commercial Fishery Farm in Milicz (Jakosc Wody Rzeki Baryczy i Jej Doplywow na Obsazarze Dolnoslaskiego Kombinatu Rybackiego).
W91-00734 5B

Seasonal Changes of the Environmental Conditions in Dimictic Lakes Differing as to Their Trophic State (Sezonowe Zmiany Warunkow Srodowiska w Jeziorach Dymiktycznych o Roznym Stopniu Eutrofizacji).
W91-00735 2H

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: I. Characteristics and Evaluation of Feeding Conditions (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: I. Charakterystyka I Ocena Warunkow Pokarmowych).
W91-00783 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: II. Qualitative and Quantitative Analyses of Nutrition and Nutritional Selectivity (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: II. Jakosciowa I Ilosciowa Analiza Pokarmu Oraz Wybiorczosc Pokarmowa).
W91-00784 8I

Feeding of Silver Carp in Eutrophic Lake Paprotecki in the Mazurian Lake Region: III. Attempt to Evaluate the Pressure on Plankton of the Introduced Fish Population (Odzywianie Sie Tolpygi Bialej (Hypophthalmichthys molitrix Val.) W Eutroficznym Jeziorze Paproteckim Na Mazurach: III. Proba Oceny Presji Introdukowanej Populacji Ryb Na Plankton).
W91-00785 8I

Microbiological Investigations of Lake Niegocin (Badania Mikrobiologiczne Jeziora Niegocin).
W91-00787 5B

POLITICAL ASPECTS
Decision-Making Process on the Danube and the Platte.
W91-00088 6B

POLLUTANT IDENTIFICATION
Summertime Sampling.
W91-00111 5A

In Vitro Inhibition of Acetylcholinesterase from Four Marine Species by Organophosphates and Carbamates.
W91-00206 5A

Soil-Gas Surveying for Subsurface Gasoline Contamination Using Total Organic Vapor Detection Instruments: Part I. Theory and Laboratory Experimentation.
W91-00368 5A

Measurement of Biodegradable Organic Matter and Bacterial Growth Potential in Drinking Water.
W91-00381 5F

Determination of Gold at Femtomolar Levels in Natural Waters by Flow Injection Inductively Coupled Plasma Quadrupole Mass Spectrometry.
W91-00388 2K

Determination of Chloroaniline Traces in Environmental Waters by Selective Extraction with Two Traps in Tandem and Liquid Chromatography.
W91-00389 5A

Automated High-Performance Liquid Chromatography for the Determination of Pesticides in Water Using Solid Phase Extraction.
W91-00390 5A

Performance Evaluation Materials for the Analysis of Volatile Organic Contaminants in Soil: A Preliminary Assessment.
W91-00393 5A

Current Status of Disinfectant Residual Measurement Methods for Free and Combined Chloride and Oxychlorine Species.
W91-00479 5A

Measurement of Chlorine Residuals in Chlorinated Cooling Waters: Effect of Organic Nitrogen.
W91-00517 5B

Trihalomethane Formation Potential and Organic Content: A New Analytical Approach.
W91-00524 5F

Identification of Organic N-Chloramines in Wastewater.
W91-00533 5A

Chlorine and Monochloramine Measurements Using a Pulsed Silver Iodide Electrode.
W91-00536 5A

Chloramine Interference in the Measurement of Free Chlorine by the Amperometric Membrane Electrode.
W91-00537 7B

Pesticides in Ground Water Data Base: 1988 Interim Report.
W91-00569 5B

Comparative Study of Toxic Lead Effect on Gill and Hemoglobin of Tilapia Fish.
W91-00722 5A

Determination of Warfarin in Drinking Water by High-Performance Liquid Chromatography after Solid-Phase Extraction.
W91-00723 5A

Determination of Fungistatic Quaternary Ammonium Compounds in Beverages and Water Samples by High-Performance Liquid Chromatography.
W91-00724 5A

Determination of Borate at Trace Levels in Environmental Samples by Ion-Exclusion Chromatography.
W91-00725 5A

Determination of Resin and Fatty Acids in Pulp and Paper Mill Effluents and White Waters by Gas-Liquid Chromatography.
W91-00726 5A

Simple Device for the Determination of Volatile Chlorinated Hydrocarbons in Water by Gas Chromatography.
W91-00727 5A

Simultaneous Determination of Nitrites, Nitrates and Amines by Ion-Interaction Reversed-Phase High-Performance Liquid Chromatography.
W91-00728 5A

Environmental Russian Roulette: Compliance at or Near the Detection Level.
W91-00802 5G

Microbial Sensor for BOD.
W91-00812 5A

Sequential Inoculation as an Adjunct in Enteric Virus Plaque Enumeration.
W91-00815 5A

Isolation of Dissolved Organic Matter from the Suwannee River Using Reverse Osmosis.
W91-00816 5B

Detection of Vibrio cholerae O1 in the Aquatic Environment by Fluorescent-Monoclonal Antibody and Culture Methods.
W91-00828 5A

Use of Membrane Extraction Disks for On-Line Trace Enrichment of Organic Compounds from Aqueous Samples.
W91-00839 5A

Microbiological Investigations into an Outbreak of Pontiac Fever Due to Legionella micdadei Associated with Use of a Whirlpool.
W91-00840 5A

Release of Heavy Metals from Snowpacks on the Japan Sea Side of Japan.
W91-00858 5B

Further Discussion on the Intercomparison of the Trace Metal Concentrations and Particle Size of Fluvial Sediment Recovered from Two Centrifuge Systems.
W91-00866 5A

F-specific RNA Bacteriophages and Sensitive Host Strains in Faeces and Wastewater of Human and Animal Origin.
W91-00872 5A

POLLUTION LOAD

Evaluation of Phosphorus Loads from Ontario Municipal Wastewater Treatment Plants.
W91-00132 5D

Estimation of Phosphorus from the Niagara River to Lake Ontario.
W91-00133 5E

Status of the Niagara River Point Source Discharge Information: Sampling Design and Estimation of Loading.
W91-00134 5B

Inferences About Point Source Loading from Upstream/Downstream River Monitoring Data.
W91-00135 5B

Transport and Sedimentation of Pollutants in a River Reach: A Chemical Mass Balance Approach.
W91-00600 5B

POLONIUM RADIOISOTOPES

Po210 and Pb210 Remobilization from Lake Sediments in Relation to Iron and Manganese Cycling.
W91-00624 5B

POLYCHAETES

Distributions and Population Structures of Two Intertidal Estuarine Polychaetes in the Lower St. Lawrence Estuary, with Special Reference to Environmental Factors.
W91-00383 2L

Colonization of Amphipods and Polychaetes to Sediments Experimentally Exposed to Oil Hydrocarbons.
W91-00707 5C

POLYCHLORINATED BIPHENYLS

Geochemical Study of Sediment Contamination in New Bedford Harbor, Massachusetts.
W91-00043 5B

Dechlorination of Four Commercial Polychlorinated Biphenyl Mixtures (Aroclors) by Anaerobic Microorganisms from Sediments.
W91-00827 5B

Dehalogenation.
W91-00926 5D

POLYCYCLIC AROMATIC HYDROCARBONS

Induced Cytochrome P-450 in Intestine and Liver of Spot (Leiostomus xanthurus) from a Polycyclic Aromatic Hydrocarbon Contaminated Environment.
W91-00198 5C

Fluorescent Polycyclic Aromatic Hydrocarbons as Probes for Studying the Impact of Colloids on Pollutant Transport in Groundwater.
W91-00623 5B

POLYMERS

Optimizing Polymer Dosage in Sludge Dewatering Process.
W91-00112 5D

Specifer's Guide to Polymer Feed Systems.
W91-00402 5D

POLYPHENOLS

Degradation of Polyphenols in Five Plant Species in the Aquatic Environment (Degradacao de Ploifenois em Cinco Especies Vegetais em Ambientes Aquaticos).
W91-00821 2H

POLYVINYL CHLORIDE PIPE

Borehole Resistivity Logging in PVC Screened Well.
W91-00264 2F

PONDING

Infiltration Under Ponded Conditions: 3. A Predictive Equation Based on Physical Parameters.
W91-00790 2G

PONDS

Physicochemistry and Vegetation of Piccaninnie Ponds, a Coastal Aquifer-Fed Pond in Southeastern South Australia.
W91-00653 2H

Ecology of Cyclopoid Copepods (Copepoda: Crustacea) in a Tropical Backwater Pond.
W91-00682 2H

POPULATION DYNAMICS

Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

Populations, Growth, Biomass and Production of Fish in a Small Stream in North-West Poland.
W91-00007 2H

Endpoints for Regional Ecological Risk Assessments.
W91-00025 6G

Ecology of Cyclopoid Copepods (Copepoda: Crustacea) in a Tropical Backwater Pond.
W91-00682 2H

Waterbirds Dynamics at Bool Lagoon, South Australia, 1983-87.
W91-00686 2H

Magpie Goose, Anseranus semipalmata, Nesting on the Mary River Floodplain, Northern Territory, Australia: Extent and Frequency of Flooding Losses.
W91-00688 2H

Biology and Ecology of Brachyuran Decapod Crustaceans in the Bay/Estuary System of Santos and Sao Vincente (Sao Paulo): 1. Occurrence and Species Composition (Bioecologia de Crustaceos Decapodos, Braquiuros, No Sistema Baia-Estuario de Santos e Sao Vincente, SP: 1. Ocorrencia e Composicao).
W91-00690 2L

Creating Conditions for Changes in Prey Community Structure by Chaoborus spp. in a Lake in Sweden.
W91-00697 2H

Remarks on the Zooplankton Population Structure near Wastewater Outfalls on the Romanian Shore of the Black Sea (Remarques sur la Structuration des Populations Zooplanctoniques dans les Zones des Emissaires d'Eaux Usees du Littoral Roumain de la Mer Noire).
W91-00711 5C

POPULATION EXPOSURE

Relationships Between Copper Concentrations in Larvae of Plectrocnemia conspersa (Curtis) (Trichoptera) and in Mine Drainage Streams.
W91-00859 5B

POROSITY

Geophysically Determined Porosity of Paleozoic Rocks in the Upper Colorado River Basin.
W91-00314 2F

Porosity and Permeability of the Paleozoic Rocks in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00315 2F

POROUS MEDIA

PCG Solutions of Flow Problems in Random Porous Media Using Mixed Finite Elements.
W91-00117 2F

Exact Solution for Flow of Slightly Compressible Fluids Through Multiple-Porosity, Multiple-Permeability Media.
W91-00588 2F

Analytical Solutions of the One-Dimensional Advection Equation and Two or Three-Dimensional Dispersion Equation.
W91-00594 5B

PORT HOPE

Statistical Zonation of Sediment Samples Using Ratio Matching and Cluster Analysis.
W91-00137 2J

POTABLE WATER

Water Resources of the White Earth Indian Reservation, Northwestern Minnesota.
W91-00341 5F

Point-of-Entry Drinking Water Treatment Systems for Superfund Applications.
W91-00572 5F

Reclaimed Water Helps Fight Drought.
W91-00772 3C

POWDER RIVER

Channel Changes at Cross Sections of the Powder River Between Moorhead and Broadus, Montana, 1975-88.
W91-00436 2J

POWERPLANTS
Chlorine Sensitivity of Early Life Stages of Freshwater Fish.
W91-00514 5C

PRAIRIES
Distribution and Abundance of Littoral Benthic Fauna in Canadian Prairie Saline Lakes.
W91-00751 2H

PRECIPITATION
Spatial and Temporal Variability of Precipitation Across Kentucky.
W91-00110 2B

Spatial Organisation of Daily Rainfall in Wales During Autumn-Winter.
W91-00115 2B

Effect of Irregularities in the Diameter Classification of Raindrops by the Joss-Waldvogel Disdrometer.
W91-00141 2B

Empirical Data on Contemporary Global Climate Changes (Temperature and Precipitation).
W91-00146 2B

Effects of Climate Change on Snowmelt Runoff Patterns.
W91-00458 2C

Frequency Distributions of Heavy Rainstorms in Illinois.
W91-00553 2B

Deterministic Signals in Precipitation in the Northwestern United States.
W91-00609 2B

Development and Application of Simple Water Balance Models to Understand the Relationship Between Climate and Water Resources.
W91-00995 2A

PRECIPITATION FORECASTING
Spatial Organisation of Daily Rainfall in Wales During Autumn-Winter.
W91-00115 2B

PRECIPITATION GAGES
Comparison of Two Cloudwater/Fogwater Collectors: The Rotating Arm Collector and the Caltech Active Strand Cloudwater Collector.
W91-00844 7B

PRECIPITATION MAPPING
Spatial and Temporal Variability of Precipitation Across Kentucky.
W91-00110 2B

Differential Reflectivity Radar Hail Measurement Technique: Observations During the Denver Hailstorm of 13 June 1984.
W91-00140 2C

PRECIPITATION SCAVENGING
Intensive Studies of Sierra Nevada Cloudwater Chemistry and Its Relationship to Precursor Aerosol and Gas Concentrations.
W91-00846 2B

PRECONCENTRATION
Automated Preconcentration of Trace Metals from Seawater and Freshwater.
W91-00615 7B

PREDATION
Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

Predation on and by Pelagic Turbellaria in Some Lakes in Brazil.
W91-00695 2H

Cyclomorphosis in Daphnia: An Adaptation to Avoid Invertebrate Predation.
W91-00696 2H

Creating Conditions for Changes in Prey Community Structure by Chaoborus spp. in a Lake in Sweden.
W91-00697 2H

PRETREATMENT OF WASTEWATER
Adsorption Removal of Cresol by Granular Activated Carbon for Medical Waste Water Treatment.
W91-00203 5D

PRETREATMENT OF WATER
Effect of Preozonation on Trihalomethane and Total Organic Halogen Formation at the Louisville Water Company.
W91-00523 5F

PRIMARY PRODUCTIVITY
Comparative Data on Primary Productivity and Mineral Phosphorus Uptake in the Euphotic Zone of the Mediterranean and Black Sea.
W91-00710 2L

Impact of Heavy Metals on the Primary Production.
W91-00713 5C

PROBABILISTIC PROCESS
Rainfall Deficits: Distribution of Monthly Runs.
W91-00886 2B

PROBABILITY DISTRIBUTION
Rainfall-Runoff Relations Derived from the Probability Theory of Storage.
W91-00592 2E

PRODUCTIVITY
Short-Term Productivity Responses of Algae and Bacteria to Zooplankton Grazing in Two Freshwater Lakes.
W91-00418 2H

Production and Decomposition in a Saline Meromictic Lake.
W91-00746 2H

PROFESSIONAL CERTIFICATION
Professional Certification and Registration for Water-Resources and Related Disciplines.
W91-00267 6E

PROFESSIONAL PERSONNEL
Professional Certification and Registration for Water-Resources and Related Disciplines.
W91-00267 6E

Case for State Certification of Water Experts.
W91-00268 6E

American Institute of Hydrology.
W91-00269 6E

Professional Registration for Geologists and Engineering Geologists.
W91-00270 6E

American Institute of Professional Geologists: Competence, Integrity, Ethics.
W91-00271 6E

Certification in the American Meteorological Society.
W91-00272 6E

Agronomists: Evaluation of Professional Competence.
W91-00273 6E

American Society for Photogrammetry and Remote Sensing Voluntary Certification Program.
W91-00274 6E

National Association of Environmental Professionals--Certification Program.
W91-00275 6E

Credentialing in the Forestry Profession.
W91-00276 6E

History of Registration of Geologists and Geophysicists in California.
W91-00277 6E

Professional Registration for Hydrologists in Arizona: A Proposal Prepared by the Arizona Hydrological Society.
W91-00278 6E

Engineering Specialty Certification.
W91-00279 6E

PROJECT PLANNING
Upgrading the Owl's Head Wastewater Treatment Plant.
W91-00107 5D

Hydrogeologic Investigations Sampling Plan.
W91-00557 7A

PROTEINS
Pelletisation in a UASB System with Protein (Casein) as Substrate.
W91-00633 5D

Survey of the Protein Content in Estuarine Waters.
W91-00795 2L

PSEUDOMONAS
Long-term Survival of and Plasmid Stability in Pseudomonas and Klebsiella Species and the Appearance of Nonculturable Cells in Agricultural Drainage Water.
W91-00733 5B

PUBLIC HEALTH
Satellite Teletransmission: Technology Applied to Hydrological Forecasting. An Example of the Fight against Onchocercosis (La Teletransmission par Satellite: Une Technologie Adaptee a la Prevision Hydrologique. Exemple de la Lutte contre l'Onchocerose).
W91-00475 7B

Water Chlorination: Chemistry, Environmental Impact and Health Effects. Volume 6.
W91-00476 5F

Water Chlorination: The Challenge.
W91-00478 5F

South Australian Water: A Disinfection Problem.
W91-00480 5F

Health Effects of Disinfectants and Disinfection By-Products: A Regulatory Perspective.
W91-00482 5F

Regulatory Effects on the Practice of Drinking Water Treatment.
W91-00483 5F

Trihalomethanes: Is Swimming Pool Water Hazardous.
W91-00484 5F

Review of Recent Epidemiological Studies Reporting Associations between Drinking Water Disinfection and Cancer.
W91-00505 5F

Case-Control Study of Multiple Cancer Sites and Water Chlorination in Iowa.
W91-00507 5C

Case-Control Study of Bladder Cancer in Massachusetts Among Populations Receiving Chlorinated and Chloraminated Drinking Water.
W91-00508 5C

Bladder Cancer, Tap Water Consumption, and Drinking Water Source.
W91-00509 5C

Serum Lipid Levels in Neighboring Communities with Chlorinated and Nonchlorinated Drinking Water.
W91-00510 5C

By-Products of Chlorination at Ten Operating Utilities.
W91-00521 5B

Incidence of Bdellovibrio spp. in Man-Made Water Systems: Coexistence with Legionellas.
W91-00876 5F

Health Effects of Hazardous Waste.
W91-00908 5C

PUBLIC POLICY
Decision-Making Process on the Danube and the Platte.
W91-00088 6B

Case Study of a Successful Facility Siting.
W91-00910 5E

PUERTO RICO
Using Rn222 to Examine Groundwater/Surface Discharge Interaction in the Rio Grande de Manati, Puerto Rico.
W91-00893 2F

PULP AND PAPER INDUSTRY
Formation and Properties of 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone, A Potent Mutagen in Chlorinated Waters.
W91-00486 5B

PULP WASTES
Determination of Resin and Fatty Acids in Pulp and Paper Mill Effluents and White Waters by Gas-Liquid Chromatography.
W91-00726 5A

PUMPAGE
Geohydrology and Simulated Effects of Pumpage on the New Orleans Aquifer System at New Orleans, Louisiana.
W91-00348 2F

PUMPING TESTS
Pumping Test in a Low Permeability Claystone Aquifer Executed with High-Resolution Electronic Water Level Recorders and Evaluated with the Versatile Computer Program HYDROPAR.
W91-00216 2F

Analysis of Pumping Test Data from Borewells in Fractured Rocks of Karnataka.
W91-00217 2F

Analysis of Test Pumping Data from Unconfined Aquifers by Simulation.
W91-00218 2F

Critical Evaluation of Pumping Test Data from Fractured Crystalline Formation.
W91-00219 2F

Computation of Transmissivity from Step-Drawdown Tests.
W91-00220 2F

Submersible Pump Tests Conducted on Bores Drilled by D.T.H. Compressor Rigs and the Comparison of Two Discharges.
W91-00232 2F

Techniques of Aquifer Parameter Evaluation Using Pocket Computers.
W91-00265 2F

PUSHKAR LAKE
Prospecting Groundwater in Pushkar Lake Region Through Remote Sensing - A Case Study.
W91-00244 7B

PYRAMID LAKE
Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

PYROLYSIS
Pyrolysis.
W91-00935 5D

QUALITY ASSURANCE
Selected Quality Assurance Data for Water Samples Collected by the U.S. Geological Survey, Idaho National Engineering Laboratory, Idaho, 1980 to 1988.
W91-00334 7B

QUEBEC
Non-Linear System to Describe Movements of Water Masses at the LG-2 Reservoir (La Grande, Quebec).
W91-00885 2H

RADAR
Measurement of Raindrop Size Distributions Using a Small Doppler Radar.
W91-00056 2B

Differential Reflectivity Radar Hail Measurement Technique: Observations During the Denver Hailstorm of 13 June 1984.
W91-00140 2C

Radar Rainfall Forecasting Method Designed for Hydrological Purposes.
W91-00156 7B

Radar Data Processing for Hydrology in the Cevennes Region.
W91-00466 7B

Monitoring of Weather Conditions on Mesoscale to Improve a Precipitation Warning System for Hydrologic Purposes.
W91-00467 7B

Study on Short-term Rainfall Prediction by Radar Raingauge.
W91-00962 2B

Towards an Improved System for Weather Radar Calibration and Rainfall Forecasting Using Raingauge Data from a Regional Telemetry System.
W91-00963 2B

Areal Reduction Factors for Design Storm Construction: Joint Use of Raingauge and Radar Data.
W91-00965 2B

RADIOACTIVE DATING
Absolute Dating of Sedimentation on Lake Torres with Spring Deposits, South Australia.
W91-00760 2H

RADIOACTIVE TRACERS
Application of Radioactive Tracer Techniques for Determining Groundwater Velocity and Direction.
W91-00223 7B

Environmental Isotope-Aided Studies on Water Resources in the Region of Cheju Island.
W91-00224 2F

Groundwater Recharge Estimation by Tritium Tracer Technique in Sathupally Area, Andhra Pradesh, India.
W91-00225 2F

Specific Yield Estimations by Radio-Active Tracer in Indo-Gangetic Plain.
W91-00227 2F

Management and Conservation of Ground Water Resource Through Point Dilution Technique Using Radiotracer - Some Case Histories.
W91-00229 4B

Use of Single Well Dilution Technique for Seepage Measurements from Canals Using Radio-Active Tracer.
W91-00230 2F

Proposal to Use Chlorine-36 for Monitoring the Movement of Radionuclides from Nuclear Explosions.
W91-00366 5A

Gas Exchange Rates for a First-Order Stream Determined with Deliberate and Natural Tracers.
W91-00606 2A

Measurement of In Situ Rates of Selenate Removal by Dissimilatory Bacterial Reduction in Sediments.
W91-00620 5B

Po210 and Pb210 Remobilization from Lake Sediments in Relation to Iron and Manganese Cycling.
W91-00624 5B

Porewater Mixing by Microorganisms, Monitored by a Radiotracer Method.
W91-00693 2J

RADIOACTIVE WASTE DISPOSAL
Implications of Environmental Program Planning for Siting a Nuclear Waste Repository at Yucca Mountain, Nevada, USA.
W91-00026 5E

Geohydrologic Aspects for Siting and Design of Low-Level Radioactive-Waste Disposal.
W91-00347 5E

Water Levels in Periodically Measured Wells in the Yucca Mountain Area, Nevada, 1988.
W91-00441 2F

Contaminant Dissolution and Diffusional Transport with a Stationary Precipitation Front.
W91-00612 5E

RADIOACTIVE WASTES
Geologic and Hydrologic Issues Related to Siting a Repository for High-level Nuclear Waste at Yucca Mountain, Nevada, U.S.A.
W91-00030 5E

Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-00336 5B

RADIOACTIVITY
Radioactivity Level of Black Sea Marine Algae Before and After the Chernobyl Accident.
W91-00796 5B

RADIOMETRY
Effects of the Dry Season on the Vegetation Canopy of some River Basins of West Africa as Deduced from NOAA-AVHRR Data.
W91-00410 2I

Radiometric Studies of Clear Air Attenuation and Atmospheric Water Vapor at 22.235 GHz over Calcutta (Lat. 22 degrees 32 minutes N, Long. 88 degrees 20 minutes E).
W91-00852 2B

RADIONUCLIDES
Pigment Stratigraphy and Trophic Status: An Evaluation of Radionuclide-Dated Lacustrine Sediment.
W91-00692 2H

RADON RADIOISOTOPES
Using Rn222 to Examine Groundwater/Surface Discharge Interaction in the Rio Grande de Manati, Puerto Rico.
W91-00893 2F

RAIN
Fourier and Moment Methods Applied to Two-Dimensional Raindrop Images.
W91-00055 2B

Measurement of Raindrop Size Distributions Using a Small Doppler Radar.
W91-00056 2B

Effect of Irregularities in the Diameter Classification of Raindrops by the Joss-Waldvogel Disdrometer.
W91-00141 2B

RAIN FORESTS
Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

RAIN GAGES
Deterministic Signals in Precipitation in the Northwestern United States.
W91-00609 2B

Comparison of Two Cloudwater/Fogwater Collectors: The Rotating Arm Collector and the Caltech Active Strand Cloudwater Collector.
W91-00844 7B

Effect of Oblique Rain on Inclined Surfaces: A Nomograph for the Rain-Gauge Correction Factor.
W91-00899 7B

Study on Short-term Rainfall Prediction by Radar Raingauge.
W91-00962 2B

Towards an Improved System for Weather Radar Calibration and Rainfall Forecasting Using Raingauge Data from a Regional Telemetry System.
W91-00963 2B

Areal Reduction Factors for Design Storm Construction: Joint Use of Raingauge and Radar Data.
W91-00965 2B

RAINFALL
Measurement of Raindrop Size Distributions Using a Small Doppler Radar.
W91-00056 2B

Modelling Long-Term Rainfall Patterns in North-east England.
W91-00099 2B

Physical Causes and Predictability of Variations in Seasonal Rainfall Over Sub-Saharan Africa.
W91-00464 2B

Potential Application of Satellite Data for Rainfall Estimation.
W91-00465 2B

Monitoring of Weather Conditions on Mesoscale to Improve a Precipitation Warning System for Hydrologic Purposes.
W91-00467 7B

Rainfall Deficits: Distribution of Monthly Runs.
W91-00886 2B

Effect of Oblique Rain on Inclined Surfaces: A Nomograph for the Rain-Gauge Correction Factor.
W91-00899 7B

New Directions for Surface Water Modeling.
W91-00961 7C

Study on Short-term Rainfall Prediction by Radar Raingauge.
W91-00962 2B

Towards an Improved System for Weather Radar Calibration and Rainfall Forecasting Using Raingauge Data from a Regional Telemetry System.
W91-00963 2B

Use of Satellite Derived Rainfall Estimates as Inputs to Flow Prediction in the River Senegal.
W91-00964 2B

Areal Reduction Factors for Design Storm Construction: Joint Use of Raingauge and Radar Data.
W91-00965 2B

Influence of the Angle of Incidence of the Rainfall on the Overland Flow Process.
W91-00969 2J

New Perspectives on Developments in Modeling of Effective Rainfall by Applying the FDTF Method (Nouvelles Perspectives de Developpement dans la Modelisation des Pluies Efficases par Application de la Methode DPFT).
W91-00985 2E

RAINFALL DISPOSITION
Rainfall-Reaeration Effects.
W91-00175 2A

RAINFALL DISTRIBUTION
Modelling Long-Term Rainfall Patterns in North-east England.
W91-00099 2B

Spatial Organisation of Daily Rainfall in Wales During Autumn-Winter.
W91-00115 2B

Frequency Distributions of Heavy Rainstorms in Illinois.
W91-00553 2B

Interception Loss and Rainfall Redistribution by Three Semi-Arid Growing Shrubs in Northeastern Mexico.
W91-00878 2I

RAINFALL FORECASTING
Radar Rainfall Forecasting Method Designed for Hydrological Purposes.
W91-00156 7B

Study on Short-term Rainfall Prediction by Radar Raingauge.
W91-00962 2B

Towards an Improved System for Weather Radar Calibration and Rainfall Forecasting Using Raingauge Data from a Regional Telemetry System.
W91-00963 2B

RAINFALL IMPACT
Climatic Change in Sunderland.
W91-00190 2B

Influence of the Angle of Incidence of the Rainfall on the Overland Flow Process.
W91-00969 2J

RAINFALL INFILTRATION
Modeling Infiltration in Hysteretic Soils.
W91-00118 2G

RAINFALL INTENSITY
Rainfall-Reaeration Effects.
W91-00175 2A

RAINFALL RATE
Analysis of Instantaneous Rainfall Rate during Flash Floods in Barcelona.
W91-00189 2B

RAINFALL-REAERATION RELATIONS
Rainfall-Reaeration Effects.
W91-00175 2A

RAINFALL-RUNOFF RELATIONSHIPS
Hydrologic and Hydraulic Research in Mountain Rivers.
W91-00083 2E

Errors in Estimated Streamflow Parameters and Storages for Ungauged Catchments.
W91-00085 2E

Stormflow and Sediment Loss from Intensively Managed Forest Watersheds in East Texas.
W91-00087 4C

Radar Rainfall Forecasting Method Designed for Hydrological Purposes.
W91-00156 7B

Estimating Groundwater Recharge Using a Surface Watershed Modelling Approach.
W91-00160 2F

Estimating Groundwater Recharge Using a Surface Watershed Model: Sensitivity Analyses.
W91-00161 7C

Analysis of Instantaneous Rainfall Rate during Flash Floods in Barcelona.
W91-00189 2B

Effects of Suburbanization upon Snowmelt Runoff.
W91-00408 2E

Hydrological Remote Sensing Research with Large-Scale Applications in Western Europe.
W91-00455 7B

Relationships Between the Hydrologic Balance of a Small Watershed and Remotely Sensed Soil Moisture.
W91-00463 2A

Radar Data Processing for Hydrology in the Cevennes Region.
W91-00466 7B

Hydrological Effects of Catchment Characteristics and Land Use Changes Determined by Satellite Imagery and GIS.
W91-00472 2A

Rainfall-Runoff Relations Derived from the Probability Theory of Storage.
W91-00592 2E

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 1. Models, Model Properties, and Experimental Design.
W91-00604 2A

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 2. Hydrologic Responses for Normal and Extreme Rainfall.
W91-00605 2A

Logging Effects on Streamflow: Storm Runoff at Caspar Creek in Northwestern California.
W91-00610 4C

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

RAINFALL-RUNOFF RELATIONSHIPS

Chemical Studies of Chloride and Stable Oxygen Isotopes in Two Conifer Afforested and Moorland Sites in the British Uplands.
W91-00890 2D

Physics-Based Approach to Stochastic Hydrology of First-Order Drainage Basins.
W91-00968 2E

Influence of the Angle of Incidence of the Rainfall on the Overland Flow Process.
W91-00969 2J

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

Entropy Based Method for Flood Forecasting.
W91-00972 2E

Assessment of Network Models in Flood Forecasting.
W91-00973 2E

Real-Time Intercomparison of Hydrological Models.
W91-00974 2A

Floods and Droughts in Labe River Basin: The Hydrograph Shape.
W91-00975 2E

Modelling of Hydrological Processes for a Mountainous Basin.
W91-00976 2A

Geomorphoclimatic Derivation of Flood Frequency (Peak and Volume) at the Basin and Regional Scale.
W91-00978 2E

Regionalization of Model Parameters for a Large Watershed.
W91-00979 2E

Analytical Relationships Between Rainfall and Runoff for a Probability-Distributed Model of Basin Response.
W91-00980 2E

Conceptual Model Simulating the Hydrological Processes on a Drainage Basin in a Plain Area.
W91-00981 2E

Effects of Recharge Systems on Hydrological Information Transfer Along Rivers.
W91-00984 2E

New Perspectives on Developments in Modeling of Effective Rainfall by Applying the FDTF Method (Nouvelles Perspectives de Developpement dans la Modelisation des Pluies Efficases par Application de la Methode DPFT).
W91-00985 2E

Regional Methods for Estimation of Design Floods for Small to Medium Sized Drainage Basins in Australia.
W91-00986 2E

Determination of Design Flood Hydrographs Based on Regional Hydrological Data.
W91-00987 2E

Regional Analysis of the Mean Annual Flood and of Flood Frequency Characteristics.
W91-00988 2E

Assessment of the US Conservation Service Method for Estimating Design Floods.
W91-00989 2E

Using GIS to Assess Spatial Variability of SCS Curve Number at the Basin Scale.
W91-01004 2E

RAINFALL SIMULATION

Dynamic Model for Short-scale Rainfall Disaggregation.
W91-00409 2B

RAINSTORMS

Frequency Distributions of Heavy Rainstorms in Illinois.
W91-00553 2B

Water Quality and PAM interactions in Reducing Surface Sealing.
W91-00791 4D

Accuracy of the Maximum Recorded Depth in Extreme Rainstorms.
W91-00966 2B

RAPID FLOW

Vortex Drop Inlet for Supercritical Approaching Flow.
W91-00153 8A

Simulation of One-Dimensional Dam-Break Flows.
W91-00399 8A

Satellite Teletransmission: Technology Applied to Hydrological Forecasting. An Example of the Fight against Onchocercosis (La Teletransmission par Satellite: Une Technologie Adaptee a la Prevision Hydrologique. Exemple de la Lutte contre l'Onchocerose).
W91-00475 7B

RATON BASIN

Ground-Water Hydrology of the Central Raton Basin, Colorado and New Mexico.
W91-00349 2F

RAW WATER

Efficacy of a Small-Quantity Water Treatment Method for Inactivating Giardia Cysts in Raw Water.
W91-00637 5F

REAERATION

Gas Exchange Rates for a First-Order Stream Determined with Deliberate and Natural Tracers.
W91-00606 2A

RECESSION

Evaluation of Automated Techniques for Base Flow and Recession Analyses.
W91-00593 2E

RECHARGE

Depletion and Recharge of Soil Water in Two Stands of Norway Spruce (Picea abies (L.) Karst).
W91-00860 2G

RECLAIMED WATER

Reclaimed Water Helps Fight Drought.
W91-00772 3C

Groundwater Recharge with Reclaimed Water in California.
W91-00800 4B

RECREATION DEMAND

Toward Empirical Estimation of the Total Value of Protecting Rivers.
W91-00584 6B

RECREATION FACILITIES

Slips Ahoy.
W91-00677 8A

RECREATION IMPACT

Lead Poisoning in Magpie Geese Anseranus semipalmata from Ingested Lead Pellet at Bool Lagoon Game Reserve (South Australia).
W91-00687 5C

RECREATIONAL EFFECTS

Pilot Studies for Designs of Surveys of Human Disturbance of Intertidal Habitats in New South Wales.
W91-00685 4C

RED SEA

Impact of Heavy Metals on the Primary Production.
W91-00713 5C

REFORESTATION

Groundwater Response to Reforestation in the Darling Range of Western Australia.
W91-00892 2F

REGIONAL ANALYSIS

Regional Water Quality: Evaluation of Data for Assessing Conditions and Trends.
W91-00619 7A

Regional Methods for Estimation of Design Floods for Small to Medium Sized Drainage Basins in Australia.
W91-00986 2E

Determination of Design Flood Hydrographs Based on Regional Hydrological Data.
W91-00987 2E

Regional Analysis of the Mean Annual Flood and of Flood Frequency Characteristics.
W91-00988 2E

Regional Flood Frequency Analysis Using Ridge Regression.
W91-00990 2E

REGIONAL AQUIFER-SYSTEMS ANALYSIS

Aquifers of the Western Mountain Area.
W91-00304 2F

Regional Bedrock Aquifers of the Northern Great Plains, North-Central United States.
W91-00305 2F

Snake River Plain Regional Aquifer System Study.
W91-00306 2F

Ground-Water Flow Systems of Western Utah.
W91-00307 2F

Upper Colorado River Basin Regional Aquifer-Systems Analysis: Mesozoic Rocks in Colorado, Utah, and Wyoming, Arizona, and New Mexico.
W91-00308 2F

Sources of Hydrologic Data on Mesozoic Formations in the Upper Colorado River Basin and Comparison of Data Analysis Methods.
W91-00309 2F

Lithologic and Hydrologic Properties of Mesozoic Rocks in the Upper Colorado River Basin.
W91-00310 2F

Hydrology of the Navajo Sandstone in Southeastern and Southern Utah.
W91-00311 2F

Geochemistry of Water Associated with the Navajo Sandstone Aquifer, San Rafael Swell Area, Utah.
W91-00312 2F

Hydrostratigraphic Characterization of Paleozoic Formations in the Upper Colorado River Basin, Arizona, Colorado, New Mexico, Utah, and Wyoming.
W91-00313 2F

Geophysically Determined Porosity of Paleozoic Rocks in the Upper Colorado River Basin.
W91-00314 2F

Porosity and Permeability of the Paleozoic Rocks in the Upper Colorado River Basin, Ari-

zona, Colorado, New Mexico, Utah, and Wyoming.
W91-00315 2F

Using a Geographic Information System to Develop a Ground-Water Flow Model.
W91-00316 2F

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

Hydrogeology of the Dinaric Karst.
W91-00318 2F

Geology of Karst Terrains and Theory in the Works of Jovan Cvijic.
W91-00319 8E

Hydrogeologic Regional Classification of Karst in Yugoslavia.
W91-00320 2F

Hydrogeologic Features of the Dinaric Karst.
W91-00321 2F

Speleological Phenomena of Dinaric Karst.
W91-00322 2F

Karst Poljes in Dinarides.
W91-00323 2F

Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

Problems of Sea Water Intrusion into Aquifers of the Coastal Dinaric Karst.
W91-00325 2F

Application of Geophysical Methods to Hydrogeological Problems in Dinaric Karst of Yugoslavia.
W91-00326 7B

Some Methods of Hydrogeologic Exploration and Water Regulation in the Dinaric Karst with Special Reference to Their Application in Eastern Herzegovina.
W91-00327 2F

Hydrogeologic Features of Typical Karst Terrains in Montenegro.
W91-00328 2F

Hydrogeological Features of Some Northern Dalmatia Littoral Karst Parts, Lika and Croatian Littoral.
W91-00329 2F

Hydrogeologic Features of Some Karst Parts of Slovenia.
W91-00330 2F

Geohydrology and Regional Ground-Water Flow of the Coastal Lowlands Aquifer System in Parts of Louisiana, Mississippi, Alabama, and Florida--A Preliminary Analysis.
W91-00332 2F

REGIONAL FLOODS

Regional Methods for Estimation of Design Floods for Small to Medium Sized Drainage Basins in Australia.
W91-00986 2E

Determination of Design Flood Hydrographs Based on Regional Hydrological Data.
W91-00987 2E

REGIONAL PLANNING

Endpoints for Regional Ecological Risk Assessments.
W91-00025 6G

REGRESSION ANALYSIS

Fuzzy Regression in Hydrology.
W91-00596 7C

Daily Flow Forecasting with Regression Analysis.
W91-00634 2E

REGULATIONS

Improving the Effectiveness of Fisheries Agencies in Developing Hydropower Mitigation.
W91-00008 6E

Continuous Effluent Consents: Modelling and Compliance Testing.
W91-00126 5G

Regulatory Effects on the Practice of Drinking Water Treatment.
W91-00483 5F

Five Year Program Strategy for the Great Lakes National Program Office, FY 1989-1993.
W91-00552 5G

Response of the US EPA Region V States to the Nonpoint Source Reporting Requirements of the 1987 Clean Water Act Amendments.
W91-00565 5G

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly.
W91-00566 5G

Role of Standards in Iowa's Groundwater Protection Program: A Report to the Iowa General Assembly, Appendix 2 - Written Comments.
W91-00567 5G

Effect of Regulation on 0+ Fish Recruitment in the Great Ouse, A Lowland River.
W91-00777 6G

Assessing Options for Stream Regulation Using Hydrologic Simulations and Cumulative Impact Analysis: Flathead River Basin, USA.
W91-00779 2E

Summary of Resource Conservation and Recovery Act Legislation and Regulation.
W91-00902 6E

Summary of CERCLA Legislation and Regulations and the EPA Superfund Program.
W91-00903 6E

Quantities and Sources of Hazardous Wastes.
W91-00905 5E

Hazardous-Waste Management Capacity.
W91-00906 5E

REMOTE SENSING

Measurement of Raindrop Size Distributions Using a Small Doppler Radar.
W91-00056 2B

Differential Reflectivity Radar Hail Measurement Technique: Observations During the Denver Hailstorm of 13 June 1984.
W91-00140 2C

Remote-Sensing Application to Well Monitoring.
W91-00169 2F

Deciphering Groundwater Using Remote Sensing Techniques.
W91-00243 7B

Prospecting Groundwater in Pushkar Lake Region Through Remote Sensing - A Case Study.
W91-00244 7B

Description of Lineaments Found in Kalavad Taluka of Jamnagar District and Drilling Drilled for Water Supply.
W91-00248 2F

Fracture Pattern Modelling for Groundwater Targetting in Hard Rock Terrain: A Study Aided by Remote Sensing Technique.
W91-00250 7C

Digital Enhancement of Surface Geologic Features in a Part of Banas River Catchment for Ground Water Potential Characterization.
W91-00252 7C

Effects of the Dry Season on the Vegetation Canopy of some River Basins of West Africa as Deduced from NOAA-AVHRR Data.
W91-00410 2I

Remote Sensing and Large-Scale Global Processes.
W91-00454 7B

Hydrological Remote Sensing Research with Large-Scale Applications in Western Europe.
W91-00455 7B

HAPEX-MOBILHY: Results from a Large-Scale Field Experiment.
W91-00456 7B

Use of Satellite Microwave Radiometers for Large-Scale Hydrology.
W91-00457 7B

First ISLSCP Field Experiment: Experiment Execution and Preliminary Analyses.
W91-00460 7B

Relating Nimbus-7 GHz Data to Land Surface Evaporation.
W91-00461 7B

Relationships Between the Hydrologic Balance of a Small Watershed and Remotely Sensed Soil Moisture.
W91-00463 2A

Potential Application of Satellite Data for Rainfall Estimation.
W91-00465 2B

Satellite Determination of Coast Range, Alaskan Glacier Mass Balance Related to Atmospheric Circulation.
W91-00468 2C

Determination of Snow Water Equivalents by Using NOAA-Satellite Images, Gamma Ray Spectrometry and Field Measurements.
W91-00470 2C

Multispectral Snow Area Algorithm for Operational 7-Day Snow Cover Monitoring.
W91-00471 2C

Hydrological Effects of Catchment Characteristics and Land Use Changes Determined by Satellite Imagery and GIS.
W91-00472 2A

Monitoring Lake Nasser by Space Sensing.
W91-00473 7B

Flood Monitoring from Space in China.
W91-00474 7B

MECA Workshop on Atmospheric H2O Observations of Earth and Mars.
W91-00576 7B

Observations of Atmospheric Water Vapor with the SAGE II Instrument.
W91-00579 7B

Measurements of H2O in the Terrestrial Mesosphere and Implications for Extra-Terrestrial Sources.
W91-00580 2B

NIMBUS 7 LIMS Water Vapor Measurements.
W91-00581 2B

REMOTE SENSING

Synchronous Fluorescence Spectroscopy of Dissolved Organic Matter in Surface Waters: Application to Airborne Remote Sensing.
W91-00639 5A

Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

SPOT and Environmental Studies: An Advanced System to Collect Up to Date Geographic Information.
W91-00793 7B

Use of Satellite Derived Rainfall Estimates as Inputs to Flow Prediction in the River Senegal.
W91-00964 2B

Areal Reduction Factors for Design Storm Construction: Joint Use of Raingauge and Radar Data.
W91-00965 2B

RESEARCH PRIORITIES
Interim: Selected Chemical Research Reported Between Conferences Five and Six.
W91-00477 5F

RESERVOIR DESIGN
Single-Outlet Detention-Pond Analysis and Design.
W91-00171 8A

RESERVOIR OPERATION
Opportunities for Reservoir-storage Reallocation.
W91-00186 6E

RESERVOIR RELEASES
Report of the River Master of the Delaware River for the Period December 1, 1987 - November 30, 1988.
W91-00344 2E

RESERVOIR SEDIMENTS
Development and Structure of the Goczalkowice Reservoir Ecosystem. XIX. Suspended-Matter Sedimentation.
W91-00005 2H

Spatial Variations in the Rate of Fluvial Erosion (Sediment Production) over South Africa.
W91-00635 2J

RESERVOIR SILTING
Development and Structure of the Goczalkowice Reservoir Ecosystem. XIX. Suspended-Matter Sedimentation.
W91-00005 2H

RESERVOIR STORAGE
Opportunities for Reservoir-storage Reallocation.
W91-00186 6E

RESERVOIRS
Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

Laterally Averaged Hydrodynamics Model for Reservoir Predictions.
W91-00062 2H

Water Waves Generated by Distant Landslides.
W91-00071 2H

Hydrologic and Water-Quality Data for Streams and Impoundments in the Coteau des Prairies--Upper Minnesota River Basin, 1979-84.
W91-00434 2E

Interactions of Contaminants with Sediment and Water in Reservoirs.
W91-00560 5B

Occurrence of Hypolimnetic Blooms of the Purple Sulfur Bacterium, Thiopedia rosea, and the Green Sulfur Bacterium, Chlorobium limicola, in an Australian Reservoir.
W91-00652 5C

Predicting Success of Walleye Stocking Programs in the United States and Canada.
W91-00691 8I

Non-Linear System to Describe Movements of Water Masses at the LG-2 Reservoir (La Grande, Quebec).
W91-00885 2H

RESIDUAL CHLORINE
Current Status of Disinfectant Residual Measurement Methods for Free and Combined Chloride and Oxychlorine Species.
W91-00479 5A

Measurement of Chlorine Residuals in Chlorinated Cooling Waters: Effect of Organic Nitrogen.
W91-00517 5B

RESISTANCE
Resistance to Antibiotics and Heavy Metals of Pseudomonas aeruginosa Isolated from Natural Waters.
W91-00698 5C

RESISTIVITY
Investigations of Groundwater Resources at Selected Levels in Droughtprone Area of Pahari Block, District Mirzapur, U.P., India.
W91-00237 2F

Hydrogeophysical Studies for Characterizing the Crystalline Aquifers of Tambraparni Basin, Tamil Nadu, India.
W91-00242 2F

RESISTIVITY SURVEYS
Brisk Ground Water Investigation for Locating Bore Hole Site is Basaltic Terrain.
W91-00249 2F

Electrical Resistivity Survey for Ground Water in Varaha River Basin, A.P., India.
W91-00251 2F

Soil Moisture Studies in Soils of Delhi Territory Using the Resistivity Meter.
W91-00258 2G

Borehole Resistivity Logging in PVC Screened Well.
W91-00264 2F

RESOURCE ALLOCATION
Opportunities for Reservoir-storage Reallocation.
W91-00186 6E

RESOURCE CONSERVATION AND RECOVERY ACT
Hazardous-Waste Treatment Comes of Age.
W91-00901 5G

Summary of Resource Conservation and Recovery Act Legislation and Regulation.
W91-00902 6E

Quantities and Sources of Hazardous Wastes.
W91-00905 5E

Hazardous-Waste Management Capacity.
W91-00906 5E

RESPIRATION
Estimation of the Critical Oxygen Tension for and Recovering Capabilities of Red Tilapia (Oreochromis niloticus X Oreochromis mossambicus) Hybrids.
W91-00683 2H

RESPIROMETRY
Biodegradation Kinetics of Substituted Phenolics: Demonstrations of a Protocol Based on Electrolytic Respirometry.
W91-00809 5B

Respiration Inhibition Kinetic Analysis.
W91-00810 5D

RETURN FLOW
Relative Performance of a Soil Moisture Accounting Model in Estimating Return Flow.
W91-00887 2G

REVERSE OSMOSIS
Isolation of Dissolved Organic Matter from the Suwannee River Using Reverse Osmosis.
W91-00816 5B

REVIEWS
Hydrology Past and Present.
W91-00066 2A

Measurement of Biodegradable Organic Matter and Bacterial Growth Potential in Drinking Water.
W91-00381 5F

REYNOLDS NUMBER
Analysis of Scale Effects on Performance Characteristics of Hydraulic Turbines: Part 2: Effects of Surface Roughness, Runner Seal Clearance and Reynolds Number on Performance and Loss Distribution Coefficients.
W91-00098 8G

RHINE RIVER
Ecotoxicology: Contamination of the Rhine by the Sandoz Chemical Accident in Basel (Oekotoxikologie am Beispiel der Rheinverschmutzung durch den Chemie-Unfall bei Sadoz in Basel).
W91-00384 5C

RHODOPHYTA
Seasonal Variation of Sirodotia delicatula Skuja (Rhodophyta, Batrachospermaceae) in a Small Stream From Sao Paulo State, Southeastern Brazil.
W91-00782 2H

RIFFLES
Spatial and Temporal Variation in Fishes of Riffle Habitats: A Comparison of Analytical Approaches for the Roanoke River.
W91-00868 8I

RIPARIAN VEGETATION
Stream Canopy and Its Relationship to Salmonid Biomass in the Intermountain West.
W91-00013 8I

RISK ANALYSIS
Hydrologic Parameter Effects on Small-Dam Risk Analysis in Missouri.
W91-00167 8A

RISK ASSESSMENT
Endpoints for Regional Ecological Risk Assessments.
W91-00025 6G

Conceptual Basis for Environmental Monitoring Programs.
W91-00794 7A

Health Effects of Hazardous Waste.
W91-00908 5C

Environmental Risk-Assessment and Audit Principles.
W91-00909 5E

RIVER BASIN DEVELOPMENT
Decision-Making Process on the Danube and the Platte.
W91-00088 6B

RIVER BASINS
Ground-Water Resources of the Arkansas River Basin in Arkansas.
W91-00355 2F

Effects of the Dry Season on the Vegetation Canopy of some River Basins of West Africa as Deduced from NOAA-AVHRR Data.
W91-00410 2I

Floods and Droughts in Labe River Basin: The Hydrograph Shape.
W91-00975 2E

Modelling of Hydrological Processes for a Mountainous Basin.
W91-00976 2A

Review of the Search for a Quantitative Link Between Hydrologic Response and Fluvial Geomorphology.
W91-00977 2E

Regionalization of Model Parameters for a Large Watershed.
W91-00979 2E

Analytical Relationships Between Rainfall and Runoff for a Probability-Distributed Model of Basin Response.
W91-00980 2E

Conceptual Model Simulating the Hydrological Processes on a Drainage Basin in a Plain Area.
W91-00981 2E

Effects of Recharge Systems on Hydrological Information Transfer Along Rivers.
W91-00984 2E

Generalized Components of Complex Decision Support Systems for Water Resources Management in River Basins.
W91-00997 4A

Using GIS to Assess Spatial Variability of SCS Curve Number at the Basin Scale.
W91-01004 2E

RIVER BEDS
Constraints on Duration of Sediment Storage in a Wide, Gravel-Bed River, New Zealand.
W91-00298 2J

Coupled Simulation of Transient Bed Evolution in Alluvial Channels.
W91-00407 2J

RIVER FLOW
Stability Limits for Preissmann's Scheme.
W91-00150 2E

Daily Flow Forecasting with Regression Analysis.
W91-00634 2E

Qualitative and Numerical Analyses of the Effects of River Inflow Variations on Mixing Diagrams in Estuaries.
W91-00720 2L

Use of Satellite Derived Rainfall Estimates as Inputs to Flow Prediction in the River Senegal.
W91-00964 2B

Entropy Based Method for Flood Forecasting.
W91-00972 2E

Droughts and Floods: Their Definition and Modeling.
W91-00992 2E

Regionalization of Low Flow Characteristics Using Logistic and GLS Regression.
W91-00993 2E

RIVER FORECASTING
Experimental Study of Complex Response in River Channel Adjustment Downstream from a Reservoir.
W91-00050 2J

Daily Flow Forecasting with Regression Analysis.
W91-00634 2E

Use of Satellite Derived Rainfall Estimates as Inputs to Flow Prediction in the River Senegal.
W91-00964 2B

RIVER ICE
Effect of Toston Dam on Upstream Ice Conditions.
W91-00574 6G

RIVER MECHANICS
Experimental Study of Complex Response in River Channel Adjustment Downstream from a Reservoir.
W91-00050 2J

RIVER SEDIMENTS
Metal Dispersal in the Fluvial System of the River Geul: The Role of Discharge, Distance to the Source, and Floodplain Geometry.
W91-00286 5B

Cross-Sectional Variability in Suspended Sediment and Associated Trace Element Concentrations in Selected Rivers in the US.
W91-00287 2J

Hysteresis and Nonlinearity of Discharge-Sediment Relationships in the Atchafalaya and Lower Mississippi Rivers.
W91-00292 2J

Soil Erosion in the Yellow River Basin and Its Impacts on Reservoir Sedimentation and the Lower Yellow River.
W91-00294 2J

Constraints on Duration of Sediment Storage in a Wide, Gravel-Bed River, New Zealand.
W91-00298 2J

Developing Accurate and Reliable Sediment Yields.
W91-00301 7C

RIVER SYSTEMS
Heavy Metals Distribution and Enrichment in the Sediments of Southern East Coast of India.
W91-00701 5B

Benthic Turfs vs Floating Mats of Algae in River Food Webs.
W91-00708 2H

Classification of the Macroinvertebrate Fauna of Two River Systems in Southwestern Australia in Relation to Physical and Chemical Parameters.
W91-00774 2H

Effects of Sediment and Flow Regime on the Aquatic Insects of a High Mountain Stream.
W91-00776 2H

Effect of Regulation on 0+ Fish Recruitment in the Great Ouse, A Lowland River.
W91-00777 6G

Assessing Options for Stream Regulation Using Hydrologic Simulations and Cumulative Impact Analysis: Flathead River Basin, USA.
W91-00779 2E

Marginal Zoobenthos of a Southern Brazilian Dam (Zoobenthos Litoraneos de um Acude Sul-Brasileiro).
W91-00780 6G

RIVER TRAINING
Conversion of Braided Gravel-Bed Rivers to Single-Thread Channels of Equivalent Transport Capacity.
W91-00078 2J

RIVERS
Flocculation of Suspended Solids in Southern Ontario Rivers.
W91-00291 2J

ROAD CONSTRUCTION
Logging Effects on Streamflow: Storm Runoff at Caspar Creek in Northwestern California.
W91-00610 4C

ROANOKE RIVER
Spatial and Temporal Variation in Fishes of Riffle Habitats: A Comparison of Analytical Approaches for the Roanoke River.
W91-00868 8I

RODENTICIDES
Determination of Warfarin in Drinking Water by High-Performance Liquid Chromatography after Solid-Phase Extraction.
W91-00723 5A

ROMANIA
Remarks on the Zooplankton Population Structure near Wastewater Outfalls on the Romanian Shore of the Black Sea (Remarques sur la Structuration des Populations Zooplanctoniques dans les Zones des Emissaires d'Eaux Usees du Littoral Roumain de la Mer Noire).
W91-00711 5C

ROTARY KILNS
Rotary Kilns.
W91-00931 5D

ROUGHNESS COEFFICIENT
Analysis of Scale Effects on Performance Characteristics of Hydraulic Turbines: Part 2: Effects of Surface Roughness, Runner Seal Clearance and Reynolds Number on Performance and Loss Distribution Coefficients.
W91-00098 8G

Guide for Selecting Manning's Roughness Coefficients for Natural Channels and Flood Plains.
W91-00335 2E

ROUTING
Algorithm for Routing Unsteady Flows in Urban Drainage Networks.
W91-00031 4C

Perturbation Solution of the Flood-Routing Problem.
W91-00763 7C

RUNNING WATERS
Distribution of Micro-Arthropods in Some Southern English Streams: The Influence of Physicochemistry.
W91-00419 2H

RUNOFF
Nitrogen and Phosphorus in Eroded Sediment from Corn and Soybean Tillage Systems.
W91-00281 5B

Cropping Systems Effects on Runoff, Erosion, Water Quality, and Properties of a Savanna Soil at Ilorin, Nigeria.
W91-00288 5B

Effects of Climate Change on Snowmelt Runoff Patterns.
W91-00458 2C

Water Quality and PAM interactions in Reducing Surface Sealing.
W91-00791 4D

RUNOFF

Analytical Relationships Between Rainfall and Runoff for a Probability-Distributed Model of Basin Response.
W91-00980 2E

Effects of Recharge Systems on Hydrological Information Transfer Along Rivers.
W91-00984 2E

RUNOFF FORECASTING
Radar Rainfall Forecasting Method Designed for Hydrological Purposes.
W91-00156 7B

Design of Detention Basins for Industrial Sites.
W91-00188 5D

Rainfall-Runoff Relations Derived from the Probability Theory of Storage.
W91-00592 2E

Modeling Snowfall-to-Snowmelt Delay.
W91-00982 2C

Operational Snow Accumulation and Snowmelt Modeling.
W91-00983 2B

EXSRM, an Expert System for Snowmelt Runoff Model (SRM).
W91-01002 2E

RUNOFF VOLUME
Geomorphoclimatic Derivation of Flood Frequency (Peak and Volume) at the Basin and Regional Scale.
W91-00978 2E

SAHEL
Physical Causes and Predictability of Variations in Seasonal Rainfall Over Sub-Saharan Africa.
W91-00464 2B

SALINE-FRESHWATER INTERFACES
Simulation of Dispersion in Layered Coastal Aquifer Systems.
W91-00155 2F

Optimization of Freshwater Inflow to Estuaries.
W91-00187 2L

Locating and Identifying Hydraulic Controls for Layered Flow Over an Obstruction.
W91-00374 2L

Multilayered Sharp Interface Model of Coupled Freshwater and Saltwater Flow in Coastal Systems: Model Development and Application.
W91-00591 2F

SALINE LAKES
Lake Thetis, Western Australia: An Example of Saline Lake Sedimentation Dominated by Benthic Microbial Processes.
W91-00655 2H

Sediment-Water Interaction as a Control on Geochemical Evolution of Playa Lake Systems in the Australian Arid Interior.
W91-00736 2H

Metal Concentrations in Surficial Sediments from Hypersaline Lakes, Australia.
W91-00737 2K

Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

Evolution of Saline Lake Waters: Gradual and Rapid Biogeochemical Pathways in the Basotu Lake District, Tanzania.
W91-00739 2H

Hydrogeochemistry of Lake Gallocanta (Aragon, NE Spain).
W91-00740 2H

Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

Nutrients in Pore Waters from Dead Sea Sediments.
W91-00742 2H

Solubility of Oxygen in the Dead Sea Brine.
W91-00744 2K

Vernal Microstratification Patterns in a Meromictic Saline Lake: Their Causes and Biological Significance.
W91-00745 2H

Production and Decomposition in a Saline Meromictic Lake.
W91-00746 2H

Autumnal Mixing in Mahoney Lake, British Columbia.
W91-00747 2H

Changes in Lake Levels, Salinity and the Biological Community of Great Salt Lake (Utah, USA), 1847-1987.
W91-00748 2H

Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

Distribution and Abundance of Littoral Benthic Fauna in Canadian Prairie Saline Lakes.
W91-00751 2H

Distribution and Abundance of the Alkali Fly (Ephydra hians) Say at Mono Lake, California (USA) in Relation to Physical Habitat.
W91-00752 2H

Distribution Patterns of Ostracods in Iberian Saline Lakes. Influence of Ecological Factors.
W91-00753 2H

Anostraca, Cladocera and Copepoda of Spanish Saline Lakes.
W91-00754 2H

Artemia monica Cyst Production and Recruitment in Mono Lake, California, USA.
W91-00755 2H

Comparative Limnology of Sambhar and Didwana Lakes (Rajasthan, NW India).
W91-00756 2H

Salinity as a Determinant of Salt Lake Fauna: A Question of Scale.
W91-00757 2H

Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

SALINE SOILS
Ecology of a Mediterranean-Climate Estuarine Wetland at Carpinteria, California: Plant Distributions and Soil Salinity in the Upper Marsh.
W91-00675 2L

SALINE WATER
Simulating Physical Processes and Economic Behavior in Saline, Irrigated Agriculture: Model Development.
W91-00585 3C

SALINE WATER BARRIERS
Problems of Sea Water Intrusion into Aquifers of the Coastal Dinaric Karst.
W91-00325 2F

SALINE WATER INTRUSION
Simulation of Dispersion in Layered Coastal Aquifer Systems.
W91-00155 2F

Remote-Sensing Application to Well Monitoring.
W91-00169 2F

Application of Radioactive Tracer Techniques for Determining Groundwater Velocity and Direction.
W91-00223 7B

Environmental Isotope-Aided Studies on Water Resources in the Region of Cheju Island.
W91-00224 2F

Problems of Sea Water Intrusion into Aquifers of the Coastal Dinaric Karst.
W91-00325 2F

Multilayered Sharp Interface Model of Coupled Freshwater and Saltwater Flow in Coastal Systems: Model Development and Application.
W91-00591 2F

Mathematical Modelling of Sea Water Intrusion, Nauru Island.
W91-00865 2L

Effects of Faults on Fluid Flow and Chloride Contamination in a Carbonate Aquifer System.
W91-00877 2F

Theory and Application of an Approximate Model of Saltwater Upconing in Aquifers.
W91-00883 2F

Motion of Coastal Groundwater in Response to the Tide.
W91-00884 2F

SALINE-WATER IRRIGATION
Simulating Physical Processes and Economic Behavior in Saline, Irrigated Agriculture: Model Development.
W91-00585 3C

Benefits of an Irrigation Water Rental Market in a Saline Stream-Aquifer System.
W91-00586 3F

SALINITY
Ecology of a Mediterranean-Climate Estuarine Wetland at Carpinteria, California: Plant Distributions and Soil Salinity in the Upper Marsh.
W91-00675 2L

Influence of Salinity on the Concentration and Rate of Interchange of Dissolved Phosphate between Water and Sediment in Fuente Piedra Lagoon (S. Spain).
W91-00743 2L

Changes in Lake Levels, Salinity and the Biological Community of Great Salt Lake (Utah, USA), 1847-1987.
W91-00748 2H

Photosynthesis of Dunaliella parva Lerche as a Function of Temperature, Light and Salinity.
W91-00750 2H

Salinity as a Determinant of Salt Lake Fauna: A Question of Scale.
W91-00757 2H

SALMON
Stream Canopy and Its Relationship to Salmonid Biomass in the Intermountain West.
W91-00013 8I

Salmon Stocks and Salmon Fisheries in the Baltic Sea (Itameren Lohikannat ja Lohenkalastus).
W91-00015 8I

Salmon of the River Simojoki: Research and Management (Simojoen Lohi Tutkimuksen ja Hoidon Kohteena).
W91-00016 8I

Reintroduction of Salmon and Sea Trout into the Vantaanjoki and Kymijoki Rivers (Lohen ja Meritaimenen Palautttaminen Vantaanjokeen ja Kymijokeen).
W91-00017 8I

Cultivaton and Management of Landlocked Salmon and Charr in Lake Saimaa (Saimaan Jarvilohen ja Nierian Viljely ja Hoito).
W91-00018 8I

Plasma Electrolytes, Gill Aluminum Content, and Gill Morphology of Juvenile Atlantic Salmon (Salmo salar) and Brook Trout (Salvelinus fontinalis) Indigenous to Acidic Streams of Nova Scotia.
W91-00616 5C

Effect of Fluoride Complexation on Aluminum Toxicity Towards Juvenile Atlantic Salmon (Salmo salar).
W91-00663 5C

SALMONIDS
Water Temperature in a Stream Gravel Bed and Implications for Salmonid Incubation.
W91-00427 8I

SALT DOMES
Disposal in Mines and Salt Domes.
W91-00953 5E

SALT MARSHES
Comparison of Vesicular-Arbuscular Mycorrhizae in Plants from Disturbed and Adjacent Undisturbed Regions of a Coastal Salt Marsh in Clinton, Connecticut, USA.
W91-00029 2I

Ecology of a Mediterranean-Climate Estuarine Wetland at Carpinteria, California: Plant Distributions and Soil Salinity in the Upper Marsh.
W91-00675 2L

Spectral Irradiance and Distribution of Pigments in a Highly Layered Marine Microbial Mat.
W91-00826 2L

Variability of Biogenic Sulfur Flux from a Temperate Salt Marsh on Short Time and Space Scales.
W91-00847 2L

SALTATION
Saltation of Snow.
W91-00603 2C

SALTS
Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

SAMPLE PREPARATION
Evaluation of Protocol for Preparing Drinking Water Samples for Ames Mutagenicity Testing.
W91-00496 5A

SAMPLE PRESERVATION
Use of Chloroform in Sediment Traps: Caution Advised.
W91-00731 7B

SAMPLERS
Two Hydrodynamically Stable Self-Suspended Buoyant Sediment Traps.
W91-00721 2J

SAMPLING
Status of the Niagara River Point Source Discharge Information: Sampling Design and Estimation of Loading.
W91-00134 5B

Cross-Sectional Variability in Suspended Sediment and Associated Trace Element Concentrations in Selected Rivers in the US.
W91-00287 2J

Flocculation of Suspended Solids in Southern Ontario Rivers.
W91-00291 2J

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

Hydrogeologic Investigations Sampling Plan.
W91-00557 7A

Littoral Benthic Fauna of Lake Managua, Nicaragua: A Study Comparing Artificial and Natural Substrata.
W91-00681 2H

Two Hydrodynamically Stable Self-Suspended Buoyant Sediment Traps.
W91-00721 2J

Use of Chloroform in Sediment Traps: Caution Advised.
W91-00731 7B

Comparison of Two Cloudwater/Fogwater Collectors: The Rotating Arm Collector and the Caltech Active Strand Cloudwater Collector.
W91-00844 7B

Influence of Outliers on Results of Wet Deposition Measurements as a Function of Measurement Strategy.
W91-00849 5B

Method to Extract Soil Water for Stable Isotope Analysis.
W91-00898 2G

Sampling and Monitoring of Remedial-Action Sites.
W91-00955 5A

Sampling and Analysis of Hazardous Wastes.
W91-00958 5A

SAN FRANCISCO BAY
Benthic Macrofauna and Ancillary Data for San Francisco Bay, California, January to November 1988.
W91-00343 2L

SAND AQUIFERS
Using Isotope Fractionation of Nitrate-Nitrogen and Nitrate-Oxygen for Evaluation of Microbial Denitrification in a Sandy Aquifer.
W91-00166 5B

Geochemistry of Iron in a Sand Dune Aquifer, Near Coos Bay and North Bend, Oregon.
W91-00430 2K

SAPROPHYTIC BACTERIA
Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

SASKATCHEWAN
Dynamics of Simulated Effects of Irrigation over Dryland Farming in Saskatchewan.
W91-00091 3F

SATELLITE TECHNOLOGY
Remote Sensing and Large-Scale Global Processes.
W91-00454 7B

Hydrological Remote Sensing Research with Large-Scale Applications in Western Europe.
W91-00455 7B

Use of Satellite Microwave Radiometers for Large-Scale Hydrology.
W91-00457 7B

First ISLSCP Field Experiment: Experiment Execution and Preliminary Analyses.
W91-00460 7B

Relating Nimbus-7 GHz Data to Land Surface Evaporation.
W91-00461 7B

Potential Application of Satellite Data for Rainfall Estimation.
W91-00465 2B

Satellite Determination of Coast Range, Alaskan Glacier Mass Balance Related to Atmospheric Circulation.
W91-00468 2C

Determination of Snow Water Equivalents by Using NOAA-Satellite Images, Gamma Ray Spectrometry and Field Measurements.
W91-00470 2C

Multispectral Snow Area Algorithm for Operational 7-Day Snow Cover Monitoring.
W91-00471 2C

Hydrological Effects of Catchment Characteristics and Land Use Changes Determined by Satellite Imagery and GIS.
W91-00472 2A

Monitoring Lake Nasser by Space Sensing.
W91-00473 7B

Flood Monitoring from Space in China.
W91-00474 7B

Satellite Teletransmission: Technology Applied to Hydrological Forecasting. An Example of the Fight against Onchocercosis (La Teletransmission par Satellite: Une Technologie Adaptee a la Prevision Hydrologique. Exemple de la Lutte contre l'Onchocerose).
W91-00475 7B

Observations of Atmospheric Water Vapor with the SAGE II Instrument.
W91-00579 7B

NIMBUS 7 LIMS Water Vapor Measurements.
W91-00581 2B

Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

SPOT and Environmental Studies: An Advanced System to Collect Up to Date Geographic Information.
W91-00793 7B

Use of Satellite Derived Rainfall Estimates as Inputs to Flow Prediction in the River Senegal.
W91-00964 2B

SATHUPALLY
Groundwater Recharge Estimation by Tritium Tracer Technique in Sathupally Area, Andhra Pradesh, India.
W91-00225 2F

SATURATED FLOW
Theory of Subsurface Water-Borne Solute Transport.
W91-00119 5B

SATURATION INDEX
Suggested Methods for Calculating and Interpreting Calcium Carbonate Saturation Indexes.
W91-00380 2K

SAUDI ARABIA
Human Activities Leading to Contact with Water in a Schistosomiasis Endemic Area, Southwest Saudi Arabia: Preliminary Observations.
W91-00678 5C

SCALING
Manganese Deposition in Chlorinated Power Plant Cooling Water.
W91-00518 5F

SCHISTOSOMIASIS
Human Activities Leading to Contact with Water in a Schistosomiasis Endemic Area, Southwest Saudi Arabia: Preliminary Observations.
W91-00678 5C

SCOTLAND
Seasonal, Hydrological, and Land Management Factors Controlling Dissolved Organic Carbon Concentrations in the Loch Fleet Catchments, Southwest Scotland.
W91-00862 2H

Chemical Studies of Chloride and Stable Oxygen Isotopes in Two Conifer Afforested and Moorland Sites in the British Uplands.
W91-00890 2D

Effects of Catchment Liming and Afforestation on the Concentration and Fractional Composition of Aluminum in the Loch Fleet Catchment, SW Scotland.
W91-00897 5G

SCOUR
Comprehensive Generalized Study of Scour at Cantilevered Pipe Outlets.
W91-00072 8B

Local Scour Around Bridge Piers.
W91-00397 2J

SCREENED WELLS
Borehole Resistivity Logging in PVC Screened Well.
W91-00264 2F

SEA LEVEL
Potential Coastal Impacts of Contemporary Changing Climate on South Asian Seas States.
W91-00027 4C

SEASONAL VARIATION
Seasonal Variability in the Sensitivity of Freshwater Lentic Communities to a Chronic Copper Stress.
W91-00196 5C

Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

Vernal Microstratification Patterns in a Meromictic Saline Lake: Their Causes and Biological Significance.
W91-00745 2H

Autumnal Mixing in Mahoney Lake, British Columbia.
W91-00747 2H

Seasonal Variation of Sirodotia delicatula Skuja (Rhodophyta, Batrachospermaceae) in a Small Stream From Sao Paulo State, Southeastern Brazil.
W91-00782 2H

SEAWATER
Determination of Gold at Femtomolar Levels in Natural Waters by Flow Injection Inductively Coupled Plasma Quadrupole Mass Spectrometry.
W91-00388 2K

SECCHI DISKS
Empirical Models for Predicting Water Quality, as Applied to Data on Lakes of Poland.
W91-00001 2H

SEDIMENT ANALYSIS
Rate of Sedimentation and Geochemistry of Southeastern Hudson Bay, Canada.
W91-00284 2J

Cross-Sectional Variability in Suspended Sediment and Associated Trace Element Concentrations in Selected Rivers in the US.
W91-00287 2J

Case Study of Approaches for Determining Diffuse Suspended Sediment Sources and Processes.
W91-00290 2J

Flocculation of Suspended Solids in Southern Ontario Rivers.
W91-00291 2J

Macrofauna Distributions and Sediment Analyses from the Brunswick, Georgia Ocean Dredged Material Disposal Site and Environs.
W91-00444 5E

Studies on the Algae of a Small Softwater Stream III. Interaction between Discharge, Sediment Composition and Diatom Flora.
W91-00871 2H

SEDIMENT-CARRYING CAPACITY
Design of Settling Basins.
W91-00097 2J

SEDIMENT CHEMISTRY
Cross-Sectional Variability in Suspended Sediment and Associated Trace Element Concentrations in Selected Rivers in the US.
W91-00287 2J

Measurement of In Situ Rates of Selenate Removal by Dissimilatory Bacterial Reduction in Sediments.
W91-00620 5B

Porewater Mixing by Microorganisms, Monitored by a Radiotracer Method.
W91-00693 2J

Heavy Metals Distribution and Enrichment in the Sediments of Southern East Coast of India.
W91-00701 5B

Colonization of Amphipods and Polychaetes to Sediments Experimentally Exposed to Oil Hydrocarbons.
W91-00707 5C

SEDIMENT CONCENTRATION
Concentration of Very Fine Silts in a Steady Vortex.
W91-00035 2J

SEDIMENT CONTAMINATION
Geochemical Study of Sediment Contamination in New Bedford Harbor, Massachusetts.
W91-00043 5B

Statistical Zonation of Sediment Samples Using Ratio Matching and Cluster Analysis.
W91-00137 2J

Transport of Mine Tailings as Suspended Sediment in the Belle Fourche River, West-Central South Dakota, USA.
W91-00283 5B

Sediment-Associated Transport and Redistribution of Chernobyl Fallout Radionuclides.
W91-00285 5B

Metal Dispersal in the Fluvial System of the River Geul: The Role of Discharge, Distance to the Source, and Floodplain Geometry.
W91-00286 5B

Interactions of Contaminants with Sediment and Water in Reservoirs.
W91-00560 5B

Transport and Sedimentation of Pollutants in a River Reach: A Chemical Mass Balance Approach.
W91-00600 5B

Lead Poisoning in Magpie Geese Anseranus semipalmata from Ingested Lead Pellet at Bool Lagoon Game Reserve (South Australia).
W91-00687 5C

Distribution and Transport of Sediment-Bound Metal Contaminants in the Rio Grande de Tarcoles, Costa Rica (Central America).
W91-00804 5A

Activity and Adaptation of Nitrilotriacetate (NTA)-Degrading Bacteria: Field and Laboratory Studies.
W91-00811 5D

SEDIMENT CONTROL
Targeting Remedial Measures to Control Nonpoint Source Pollution.
W91-00090 5G

Soil Erosion in the Yellow River Basin and Its Impacts on Reservoir Sedimentation and the Lower Yellow River.
W91-00294 2J

SEDIMENT DISCHARGE
Stormflow and Sediment Loss from Intensively Managed Forest Watersheds in East Texas.
W91-00087 4C

Menu of Coupled Velocity and Sediment-discharge Relations for Rivers.
W91-00149 2J

Hillslope and Channel Sediment Delivery and Impacts of Soil Erosion on Water Resources.
W91-00300 2J

SEDIMENT DISTRIBUTION
Constraints on Duration of Sediment Storage in a Wide, Gravel-Bed River, New Zealand.
W91-00298 2J

SEDIMENT EROSION
Geomorphological Effects of Catastrophic Flooding on a Small Subtropical Estuary.
W91-00049 2J

Long and Short-term Episodic Storage and Removal of Sediment in Watersheds of Southwestern Wisconsin and Northwestern Illinois.
W91-00297 2J

Local Scour Around Bridge Piers.
W91-00397 2J

SEDIMENT LOAD
Constraints on Duration of Sediment Storage in a Wide, Gravel-Bed River, New Zealand.
W91-00298 2J

Developing Accurate and Reliable Sediment Yields.
W91-00301 7C

Bias and Variance of some Estimators of Suspended Sediment Load.
W91-00406 2J

SEDIMENT SAMPLER
Cross-Sectional Variability in Suspended Sediment and Associated Trace Element Concentrations in Selected Rivers in the US.
W91-00287 2J

Two Hydrodynamically Stable Self-Suspended Buoyant Sediment Traps.
W91-00721 2J

Use of Chloroform in Sediment Traps: Caution Advised.
W91-00731 7B

SEDIMENT STORAGE
Sediment Storage and Movement on the Southern High Plains of Texas as Indicated by Beryllium-Ten.
W91-00299 2J

SEDIMENT TRANSPORT
Local Scour Profiles Downstream of Hydraulic Jump.
W91-00032 8B

Depth-Integrated Model for Suspended Sediment Transport.
W91-00033 2J

Concentration of Very Fine Silts in a Steady Vortex.
W91-00035 2J

Velocity Distribution in Alluvial Channel Flow.
W91-00036 8B

Bed Form Resistances in Open Channel Flows.
W91-00063 8B

One-Dimensional Model for the Transport of a Sediment Mixture in Non-Equilibrium Conditions.
W91-00070 2J

Conversion of Braided Gravel-Bed Rivers to Single-Thread Channels of Equivalent Transport Capacity.
W91-00078 2J

Reconstruction of the Recent Flow History of a Braided Gravel River.
W91-00079 2E

Temporal Lag Effect in Bed Load Sediment Transport.
W91-00093 2J

Prediction of Entrainment Conditions for Non-uniform, Noncohesive Sediments.
W91-00094 2J

Menu of Coupled Velocity and Sediment-discharge Relations for Rivers.
W91-00149 2J

Design of Stable Alluvial Channels.
W91-00154 2J

Longshore-Transport Model for South Indian and Sri Lankan Coasts.
W91-00176 2L

2-D Bed Evolution in Natural Watercourses: New Simulation Approach.
W91-00177 2J

Sediment and the Environment.
W91-00280 2J

Transport of Mine Tailings as Suspended Sediment in the Belle Fourche River, West-Central South Dakota, USA.
W91-00283 5B

Sediment-Associated Transport and Redistribution of Chernobyl Fallout Radionuclides.
W91-00285 5B

Metal Dispersal in the Fluvial System of the River Geul: The Role of Discharge, Distance to the Source, and Floodplain Geometry.
W91-00286 5B

Case Study of Approaches for Determining Diffuse Suspended Sediment Sources and Processes.
W91-00290 2J

Hysteresis and Nonlinearity of Discharge-Sediment Relationships in the Atchafalaya and Lower Mississippi Rivers.
W91-00292 2J

Long and Short-term Episodic Storage and Removal of Sediment in Watersheds of Southwestern Wisconsin and Northwestern Illinois.
W91-00297 2J

Constraints on Duration of Sediment Storage in a Wide, Gravel-Bed River, New Zealand.
W91-00298 2J

Sediment Storage and Movement on the Southern High Plains of Texas as Indicated by Beryllium-Ten.
W91-00299 2J

Hillslope and Channel Sediment Delivery and Impacts of Soil Erosion on Water Resources.
W91-00300 2J

Significance of Sediment Transport in Arroyo Development.
W91-00346 2J

Coupled Simulation of Transient Bed Evolution in Alluvial Channels.
W91-00407 2J

Retention and Resuspension of Phosphorus, Nitrogen, and Iron in a Central Ontario Lake.
W91-00656 2H

SEDIMENT-WATER INTERFACES
Velocity Distribution in Alluvial Channel Flow.
W91-00036 8B

Sediment-Water Interaction as a Control on Geochemical Evolution of Playa Lake Systems in the Australian Arid Interior.
W91-00736 2H

SEDIMENT YIELD
Case Study of Approaches for Determining Diffuse Suspended Sediment Sources and Processes.
W91-00290 2J

Hillslope and Channel Sediment Delivery and Impacts of Soil Erosion on Water Resources.
W91-00300 2J

Developing Accurate and Reliable Sediment Yields.
W91-00301 7C

Bias and Variance of some Estimators of Suspended Sediment Load.
W91-00406 2J

Sediment Yield and Discharge in Mountainous Small River Basins: Actual Condition of Sediment Discharge After Damage Caused by Sand and Stone Avalanches (in Japanese).
W91-00766 2J

SEDIMENTARY AQUIFERS
Hydrochemical Characterization of Groundwater Mixing in Sedimentary and Metamorphic Reservoirs with Combined Use of Piper's Principle and Factor Analysis.
W91-00164 2K

SEDIMENTATION
Development and Structure of the Goczalkowice Reservoir Ecosystem. XIX. Suspended-Matter Sedimentation.
W91-00005 2H

Geomorphological Effects of Catastrophic Flooding on a Small Subtropical Estuary.
W91-00049 2J

Bed Form Resistances in Open Channel Flows.
W91-00063 8B

Weakly Depositing Turbidity Current on a Small Slope.
W91-00096 2J

Soil Erosion in the Yellow River Basin and Its Impacts on Reservoir Sedimentation and the Lower Yellow River.
W91-00294 2J

Cost Impacts of Sediments in South African Rivers.
W91-00295 2J

Physical Habitat Simulation and Sedimentation.
W91-00303 4C

Dredging of North Park Lake, County of Allegheny, Pennsylvania.
W91-00564 5G

Two Hydrodynamically Stable Self-Suspended Buoyant Sediment Traps.
W91-00721 2J

Recent Carbonate Sedimentation and Brine Evolution in the Saline Lake Basins of the Cariboo Plateau, British Columbia, Canada.
W91-00741 2H

Absolute Dating of Sedimentation on Lake Torres with Spring Deposits, South Australia.
W91-00760 2H

Sediment Yield and Discharge in Mountainous Small River Basins: Actual Condition of Sediment Discharge After Damage Caused by Sand and Stone Avalanches (in Japanese).
W91-00766 2J

Effects of Sediment and Flow Regime on the Aquatic Insects of a High Mountain Stream.
W91-00776 2H

SEDIMENTATION BASINS
Reducing Maintenance in a Water Treatment Plant.
W91-00629 5F

SEDIMENTATION RATES
Longshore-Transport Model for South Indian and Sri Lankan Coasts.
W91-00176 2L

Rate of Sedimentation and Geochemistry of Southeastern Hudson Bay, Canada.
W91-00284 2J

Long and Short-term Episodic Storage and Removal of Sediment in Watersheds of Southwestern Wisconsin and Northwestern Illinois.
W91-00297 2J

Sediment Storage and Movement on the Southern High Plains of Texas as Indicated by Beryllium-Ten.
W91-00299 2J

SEDIMENTS
Sediment and the Environment.
W91-00280 2J

Role of Sediment in Metolachlor Transport from Agricultural Fields.
W91-00282 5B

Cost Impacts of Sediments in South African Rivers.
W91-00295 2J

Mineralization, Pore Water Chemistry and Phosphorus Release from Peaty Sediments in the Eutrophic Loosdrecht Lakes, The Netherlands.
W91-00426 2H

Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

SEDIMENTS

Seasonal Variation in the Structure of the Microbial Community Capable of Nitrate Respiration in an Intertidal Mud Flat Sediment from the Elbe Estuary.
W91-00650 2L

Potential Bio-available Phosphorus in Sediments of the River Elbe in Northern Germany.
W91-00651 2L

Metal Concentrations in Surficial Sediments from Hypersaline Lakes, Australia.
W91-00737 2K

Nutrients in Pore Waters from Dead Sea Sediments.
W91-00742 2H

Influence of Salinity on the Concentration and Rate of Interchange of Dissolved Phosphate between Water and Sediment in Fuente Piedra Lagoon (S. Spain).
W91-00743 2L

Dechlorination of Four Commercial Polychlorinated Biphenyl Mixtures (Aroclors) by Anaerobic Microorganisms from Sediments.
W91-00827 5B

SEEPAGE
Use of Single Well Dilution Technique for Seepage Measurements from Canals Using Radio-Active Tracer.
W91-00230 2F

Computer Simulation of an Injected Tracer Movement.
W91-00262 2F

SEEPAGE CONTROL
Hydrogeological Study of Laterite at a Representative Dam Site in Malvan Valley of Konkan Region (Maharashtra-India) Using Seismic Refraction Method.
W91-00240 2F

SEISMIC PROPERTIES
Three-Dimensional Boundary Element Reservoir Model for Seismic Analysis of Arch and Gravity Dams.
W91-00123 8D

Hydrogeological Study of Laterite at a Representative Dam Site in Malvan Valley of Konkan Region (Maharashtra-India) Using Seismic Refraction Method.
W91-00240 2F

SEISMIC SURVEYS
Hydrogeological Study of Laterite at a Representative Dam Site in Malvan Valley of Konkan Region (Maharashtra-India) Using Seismic Refraction Method.
W91-00240 2F

SEISMIC WAVES
Seismic Damage to Segmented Buried Pipelines.
W91-00124 8G

SEISMOLOGY
Strides in Nondestructive Testing.
W91-00676 8G

SELENIUM
Measurement of In Situ Rates of Selenate Removal by Dissimilatory Bacterial Reduction in Sediments.
W91-00620 5B

SEMIARID LANDS
Interception Loss and Rainfall Redistribution by Three Semi-Arid Growing Shrubs in Northeastern Mexico.
W91-00878 2I

SENSITIVITY ANALYSIS
Estimating Groundwater Recharge Using a Surface Watershed Model: Sensitivity Analyses.
W91-00161 7C

SENSORS
Microbial Sensor for BOD.
W91-00812 5A

SEOUL
Environmental Isotope-Aided Study on River Water and Groundwater Interaction in the Region of Seoul and Taegu.
W91-00257 2A

SEPARATION TECHNIQUES
Automated Preconcentration of Trace Metals from Seawater and Freshwater.
W91-00615 7B

Membrane Separation Technologies.
W91-00918 5D

Filtration and Separation.
W91-00922 5D

SEPTIC TANKS
Investigating Septic Disposal Sites Using a Velocity Permeameter.
W91-00394 5D

SESTON
Empirical Models for Predicting Water Quality, as Applied to Data on Lakes of Poland.
W91-00001 2H

SETTLING BASINS
Design of Settling Basins.
W91-00097 2J

SEWAGE
Gill Lesions in the Perch, Anabas testudineus, Subjected to Sewage Toxicity.
W91-00205 5C

SEWER SYSTEMS
Energy Head Implications of the Installation of Circular Flap Gates on Drainage Outfalls.
W91-00068 8C

State Space Approach to the Behavior of Sewer Systems.
W91-00375 5D

Hydrogen Sulfide Treatment Systems in Sanitary Sewers.
W91-00769 5D

Microtunneling Techniques Aid Sewer Installation.
W91-00773 8A

SHEAR STRESS
Turbulence Measurements in a Shear Layer Region of a Compound Channel.
W91-00039 8B

SHELLFISH
Incidence of Vibrio parahaemolyticus in U.S. Coastal Waters and Oysters.
W91-00825 5B

SHRIMP
Effects of a Fixed-Crest Weir on Brown Shrimp Penaeus aztecus Growth, Mortality, and Emigration in a Louisiana Coastal Marsh.
W91-00010 8I

Bioaccumulation of Kepone by Grass Shrimp (Palaemonetes pugio): Importance of Dietary Accumulation and Food Ration.
W91-00201 5B

SIERRA NEVADA
Responses of Zooplankton and Zoobenthos to Experimental Acidification in a High-Elevation Lake (Sierra Nevada, California, U.S.A).
W91-00425 5C

SILICA
Automated Determination of Silica in Surface and Ground Water (Die Outomatiese Bepaling van Silika in Oppervlak en Grondwater).
W91-00638 7B

SILT
Concentration of Very Fine Silts in a Steady Vortex.
W91-00035 2J

SILTING
Longshore-Transport Model for South Indian and Sri Lankan Coasts.
W91-00176 2L

SILVER
Disinfection of Drinking Water by Filtration through Silver Impregnated Alumina.
W91-00391 5F

SIMOJOKI RIVER
Salmon of the River Simojoki: Research and Management (Simojoen Lohi Tutkimuksen ja Hoidon Kohteena).
W91-00016 8I

SIMULATION
Tidal Flow Simulation in the English Channel and Southern North Sea.
W91-00047 2L

Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

Rainfall Deficits: Distribution of Monthly Runs.
W91-00886 2B

Real Time Simulation Model as a Decision Support System for Surface Water Management.
W91-00998 4A

Intelligent Geographic Information Systems (IGIS) and Surface Water Modeling.
W91-01001 4A

SIMULATION ANALYSIS
Simulation Model of Phosphorus Cycling in the Epilimnion of a Eutrophic Lake.
W91-00003 2H

Nonparametric Flood-frequency Analysis with Historical Information.
W91-00152 2E

Simulation of Dispersion in Layered Coastal Aquifer Systems.
W91-00155 2F

Analysis of Test Pumping Data from Unconfined Aquifers by Simulation.
W91-00218 2F

Computer Simulation of an Injected Tracer Movement.
W91-00262 2F

Physical Habitat Simulation and Sedimentation.
W91-00303 4C

Geohydrology and Simulated Effects of Pumpage on the New Orleans Aquifer System at New Orleans, Louisiana.
W91-00348 2F

Statistical Processor for Analyzing Simulations Made Using the Modular Finite-Difference Ground-Water Flow Model.
W91-00353 7C

Simulation of One-Dimensional Dam-Break Flows.
W91-00399 8A

Coupled Simulation of Transient Bed Evolution in Alluvial Channels.
W91-00407 2J

SINKHOLES
Review of Some Significant Ponors in Sinjsko and Duvanjsko Poljes.
W91-00324 2F

SIPHONS
Siphon Quenches.
W91-00142 8A

SITE REMEDIATION
Two-stage Ground-water Remediation Design.
W91-00184 5G

Superfund Record of Decision: Velsicol Chemical Corporation, IL.
W91-00445 5G

Superfund Record of Decision: Independent Nail, SC.
W91-00446 5G

Superfund Record of Decision: French Limited, TX.
W91-00447 5G

Superfund Record of Decision, John Deere Dubuque Works, IA.
W91-00559 5G

Toxicity of 1,1,1-Trichloroethane and Trichloroethene on a Mixed Culture of Methane-Oxidizing Bacteria.
W91-00832 5G

Tetrachloroethene Transformation to Trichloroethene and cis-1,2-Dichloroethene by Sulfate-Reducing Enrichment Cultures.
W91-00833 5B

Sampling and Monitoring of Remedial-Action Sites.
W91-00955 5A

Site Remediation.
W91-00957 5G

SITE SELECTION
Geologic and Hydrologic Issues Related to Siting a Repository for High-level Nuclear Waste at Yucca Mountain, Nevada, U.S.A.
W91-00030 5E

Deep Geoelectrical Soundings and Shapes of Curves Used for Recommendations of Bore Sites in Basaltic Terrain.
W91-00247 7B

Geohydrologic Aspects for Siting and Design of Low-Level Radioactive-Waste Disposal.
W91-00347 5E

Investigating Septic Disposal Sites Using a Velocity Permeameter.
W91-00394 5D

Siting of Hazardous-Waste Facilities.
W91-00907 5E

Case Study of a Successful Facility Siting.
W91-00910 5E

LOPES
Geomorphic Design and Management of Disturbed Lands.
W91-00296 4C

Hillslope and Channel Sediment Delivery and Impacts of Soil Erosion on Water Resources.
W91-00300 2J

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.
W91-00864 2G

SLUDGE
Improving the Sludge Conditioning Potential of Moringa Seed.
W91-00028 5D

Improved Performance of Upflow Anaerobic Sludge Blanket (UASB) Reactors by Operating Alternatives.
W91-00416 5D

Sludge Management Systems.
W91-00771 5D

Development of a New Methodology for the Assessment of Specific Methanogenic Activity.
W91-00805 5D

SLUDGE BED
Growth of Biopellets on Glucose in Upflow Anaerobic Sludge Bed (UASB) Systems.
W91-00631 5D

Effect of Nitrogen Limitation on Pelletisation in Upflow Anaerobic Sludge Bed Systems.
W91-00632 5D

Pelletisation in a UASB System with Protein (Casein) as Substrate.
W91-00633 5D

SLUDGE CONDITIONING
Improving the Sludge Conditioning Potential of Moringa Seed.
W91-00028 5D

Optimizing Polymer Dosage in Sludge Dewatering Process.
W91-00112 5D

SLUDGE DISPOSAL
Sludge Disposal, Dallas Style.
W91-00143 5E

Users Manual for the SLUDGEMAN Model for the Groundwater Pathway in the Monofilling of Sewage Sludge.
W91-00575 5E

Closure of an Unlined Evaporation Pond: A Case History.
W91-00855 5G

SLUDGE DRYING
Optimizing Polymer Dosage in Sludge Dewatering Process.
W91-00112 5D

Moving Sludge.
W91-00113 5D

High-Solids Centrifuges Turn Out to Be Surprise Dewatering Choice.
W91-00114 5D

Sludge Disposal, Dallas Style.
W91-00143 5E

SLUDGE TREATMENT
Biological Treatment of Hazardous Wastes, Sludges and Wastewater.
W91-00404 5D

Sludge Management Systems.
W91-00771 5D

Development of a New Methodology for the Assessment of Specific Methanogenic Activity.
W91-00805 5D

SLUDGEMAN MODEL
Users Manual for the SLUDGEMAN Model for the Groundwater Pathway in the Monofilling of Sewage Sludge.
W91-00575 5E

SNAILS
Effects of Low pH and Low Calcium Concentration on the Pulmonate Snail Planorbella trivolvis: A Laboratory Study.
W91-00838 5C

SNAKE RIVER
Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-00336 5B

SNOW
Variable Lapse Rate Snowline Model for the Remarkables, Central Otago, New Zealand.
W91-00076 2C

Field Investigations on the Snow Chemistry in Central and Southern California-I. Inorganic Ions and Hydrogen Peroxide.
W91-00842 5B

Field Investigations on the Snow Chemistry in Central and Southern California-II. Carbonyls and Carboxylic Acids.
W91-00843 5B

SNOW ACCUMULATION
Modeling Snowfall-to-Snowmelt Delay.
W91-00982 2C

Operational Snow Accumulation and Snowmelt Modeling.
W91-00983 2B

SNOW COVER
Hydrological Remote Sensing Research with Large-Scale Applications in Western Europe.
W91-00455 7B

Use of Satellite Microwave Radiometers for Large-Scale Hydrology.
W91-00457 7B

Multispectral Snow Area Algorithm for Operational 7-Day Snow Cover Monitoring.
W91-00471 2C

Saltation of Snow.
W91-00603 2C

SNOWLINE
Variable Lapse Rate Snowline Model for the Remarkables, Central Otago, New Zealand.
W91-00076 2C

Satellite Determination of Coast Range, Alaskan Glacier Mass Balance Related to Atmospheric Circulation.
W91-00468 2C

SNOWMAKING
Estimated Runoff from Man-Made Snow.
W91-00092 2C

SNOWMELT
Effects of Suburbanization upon Snowmelt Runoff.
W91-00408 2E

Hydrological Remote Sensing Research with Large-Scale Applications in Western Europe.
W91-00455 7B

Effects of Climate Change on Snowmelt Runoff Patterns.
W91-00458 2C

SNOWMELT

Determination of Snow Water Equivalents by Using NOAA-Satellite Images, Gamma Ray Spectrometry and Field Measurements.
W91-00470 2C

Episodic Acidification of Adirondack Lakes During Snowmelt.
W91-00608 5B

Release of Heavy Metals from Snowpacks on the Japan Sea Side of Japan.
W91-00858 5B

Modeling Snowfall-to-Snowmelt Delay.
W91-00982 2C

Operational Snow Accumulation and Snowmelt Modeling.
W91-00983 2B

EXSRM, an Expert System for Snowmelt Runoff Model (SRM).
W91-01002 2E

SNOWPACK

Variable Lapse Rate Snowline Model for the Remarkables, Central Otago, New Zealand.
W91-00076 2C

Multispectral Snow Area Algorithm for Operational 7-Day Snow Cover Monitoring.
W91-00471 2C

Field Investigations on the Snow Chemistry in Central and Southern California-I. Inorganic Ions and Hydrogen Peroxide.
W91-00842 5B

Field Investigations on the Snow Chemistry in Central and Southern California-II. Carbonyls and Carboxylic Acids.
W91-00843 5B

Release of Heavy Metals from Snowpacks on the Japan Sea Side of Japan.
W91-00858 5B

SOIL ANALYSIS

Soil-Gas Surveying for Subsurface Gasoline Contamination Using Total Organic Vapor Detection Instruments: Part I. Theory and Laboratory Experimentation.
W91-00368 5A

Performance Evaluation Materials for the Analysis of Volatile Organic Contaminants in Soil: A Preliminary Assessment.
W91-00393 5A

Movement and Fate of Atrazine and Bromide in Central Kansas Croplands.
W91-00882 5B

SOIL BACTERIA

Crude Oil and Hydrocarbon-degrading Strains of Rhodococcus rhodochrous Isolated from Soil and Marine Environments in Kuwait.
W91-00144 5B

SOIL CHEMISTRY

Transformation and Transport of Ammonium Nitrogen in a Flooded Organic Soil.
W91-00716 5B

Spectroscopic Investigations of Peat-Water Interactions: An ESR, FT-IR, and NMR Study.
W91-00789 2H

Water Quality and PAM interactions in Reducing Surface Sealing.
W91-00791 4D

Simulation of Nitrate Nitrogen Breakthrough Curves Stemming from Leaching of Ammonium Nitrate Through Soil.
W91-00896 5B

SOIL CONTAMINATION

Qualitative Validation of Pollutant Transport Components of an Unsaturated Soil Zone Model (SESOIL).
W91-00573 5B

Movement and Fate of Atrazine and Bromide in Central Kansas Croplands.
W91-00882 5B

SOIL EROSION

Stormflow and Sediment Loss from Intensively Managed Forest Watersheds in East Texas.
W91-00087 4C

Targeting Remedial Measures to Control Nonpoint Source Pollution.
W91-00090 5G

Nitrogen and Phosphorus in Eroded Sediment from Corn and Soybean Tillage Systems.
W91-00281 5B

Cropping Systems Effects on Runoff, Erosion, Water Quality, and Properties of a Savanna Soil at Ilorin, Nigeria.
W91-00288 5B

Soil Erosion and Floodplain Soil Pollution: Related Problems in the Geographical Context of a River Basin.
W91-00289 5B

Soil Erosion in the Yellow River Basin and Its Impacts on Reservoir Sedimentation and the Lower Yellow River.
W91-00294 2J

Cost Impacts of Sediments in South African Rivers.
W91-00295 2J

Long and Short-term Episodic Storage and Removal of Sediment in Watersheds of Southwestern Wisconsin and Northwestern Illinois.
W91-00297 2J

Hillslope and Channel Sediment Delivery and Impacts of Soil Erosion on Water Resources.
W91-00300 2J

Preliminary Assessment of the Potential for Using Cesium-137 to Estimate Rates of Soil Erosion in the Loess Plateau of China.
W91-00405 2J

Hydrologic and Chemical-Quality Data from Four Rural Basins in Guilford County, North Carolina, 1985-88.
W91-00433 5B

Hydrologic and Water-Quality Data for Streams and Impoundments in the Coteau des Prairies--Upper Minnesota River Basin, 1979-84.
W91-00434 2E

SOIL FUNGI

Comparison of Vesicular-Arbuscular Mycorrhizae in Plants from Disturbed and Adjacent Undisturbed Regions of a Coastal Salt Marsh in Clinton, Connecticut, USA.
W91-00029 2I

SOIL GASES

Soil-Gas Surveying for Subsurface Gasoline Contamination Using Total Organic Vapor Detection Instruments: Part I. Theory and Laboratory Experimentation.
W91-00368 5A

SOIL LINERS

Soil Liners.
W91-00952 5E

SOIL MOISTURE

Relative Performance of a Soil Moisture Accounting Model in Estimating Return Flow.
W91-00887 2G

SOIL MOISTURE RETENTION

Note on the Analysis of Moisture-Depth Curves Obtained by the Hot-Air Method for the Determination of Soil Moisture Diffusivity.
W91-00889 2G

SOIL PROPERTIES

Investigating Septic Disposal Sites Using a Velocity Permeameter.
W91-00394 5D

SOIL SOLUTION

Nitrous Oxide Dissolved in Soil Solution: An Insignificant Pathway of Nitrogen Loss from a Southeastern Hardwood Forest.
W91-00613 2G

SOIL TEMPERATURE

Zero-Curtain Effect: Heat and Mass Transfer Across an Isothermal Region in Freezing Soil.
W91-00597 2C

SOIL TREATMENT

Toxicity of 1,1,1-Trichloroethane and Trichloroethene on a Mixed Culture of Methane-Oxidizing Bacteria.
W91-00832 5G

Tetrachloroethene Transformation to Trichloroethene and cis-1,2-Dichloroethene by Sulfate-Reducing Enrichment Cultures.
W91-00833 5B

SOIL TYPES

Longitudinal and Seasonal Water Chemistry Variations in a Northern Appalachian Stream.
W91-00089 2K

SOIL WATER

Moisture Variation Study by Neutron-Neutron Logging.
W91-00255 7C

Study of Soil Moisture Movement in the Vadose Zone Using Neutron Probe.
W91-00256 7B

Soil Moisture Studies in Soils of Delhi Territory Using the Resistivity Meter.
W91-00258 2G

Estimation of Recharge and Pollutant Transfer to Groundwater by Modelling of Unsaturated Zone.
W91-00259 2F

Functional Relation for Capillary Suction vs. Moisture Content.
W91-00260 7C

Use of Satellite Microwave Radiometers for Large-Scale Hydrology.
W91-00457 7B

Relationships Between the Hydrologic Balance of a Small Watershed and Remotely Sensed Soil Moisture.
W91-00463 2A

MECA Workshop on Atmospheric H2O Observations of Earth and Mars.
W91-00576 7B

General Mass-Conservative Numerical Solution for the Unsaturated Flow Equation.
W91-00595 2G

Modeling the Movement of Volatile Organic Chemicals in Columns of Unsaturated Soil.
W91-00599 5B

Periodic Moisture Fluctuation as a Factor Affecting Mire Vegetation.
W91-00644 2H

Transformation and Transport of Ammonium Nitrogen in a Flooded Organic Soil.
W91-00716 5B

Infiltration Under Ponded Conditions: 3. A Predictive Equation Based on Physical Parameters.
W91-00790 2G

Depletion and Recharge of Soil Water in Two Stands of Norway Spruce (Picea abies (L.) Karst).
W91-00860 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.
W91-00864 2G

Note on the Analysis of Moisture-Depth Curves Obtained by the Hot-Air Method for the Determination of Soil Moisture Diffusivity.
W91-00889 2G

Simulation of Nitrate Nitrogen Breakthrough Curves Stemming from Leaching of Ammonium Nitrate Through Soil.
W91-00896 5B

Method to Extract Soil Water for Stable Isotope Analysis.
W91-00898 2G

Analytical Relationships Between Rainfall and Runoff for a Probability-Distributed Model of Basin Response.
W91-00980 2E

Evaporation from Soil Surface in Presence of Shallow Water Tables.
W91-00996 2D

SOIL-WATER-PLANT RELATIONSHIPS

Diurnal Fluctuation in Stream Flow and in Specific Electric Conductance During Drought Periods.
W91-00881 2E

Groundwater Response to Reforestation in the Darling Range of Western Australia.
W91-00892 2F

SOIL WATER POTENTIAL

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.
W91-00864 2G

SOIL WATER SUCTION

Functional Relation for Capillary Suction vs. Moisture Content.
W91-00260 7C

SOLAR RADIATION

Photochemical Disinfection of Effluents-Pilot Plant Studies.
W91-00807 5D

SOLID WASTES

Mining Wastes.
W91-00911 5E

SOLIMOES RIVER

Water Chemistry of the Solimoes/Amazon River (A Hidroquimica do Rio Solimoes/Amazonas).
W91-00820 2K

SOLUBILITY

Modeling the Potential Effect of Additives on Enhancing the Solubility of Aromatic Solutes Contained in Gasoline.
W91-00369 5B

Solubility of Oxygen in the Dead Sea Brine.
W91-00744 2K

SOLUTE TRANSPORT

Three-Dimensional Scale Model of Ground-Water Solute Transport.
W91-00064 5B

Estimation of Recharge and Pollutant Transfer to Groundwater by Modelling of Unsaturated Zone.
W91-00259 2F

Modeling the Potential Effect of Additives on Enhancing the Solubility of Aromatic Solutes Contained in Gasoline.
W91-00369 5B

Transport of Low-Concentration Contaminants in Saturated Earthen Barriers.
W91-00372 5E

Qualitative Validation of Pollutant Transport Components of an Unsaturated Soil Zone Model (SESOIL).
W91-00573 5B

Analytical Solutions of the One-Dimensional Advection Equation and Two or Three-Dimensional Dispersion Equation.
W91-00594 5B

Mathematical Modeling of Tracer Behavior in Short-Term Experiments in Fissured Rocks.
W91-00598 5B

SOLUTES

Origin of Soluble Chemical Species in Bulk Precipitation Collected in Tokyo, Japan: Statistical Evaluation of Source Materials.
W91-00670 5B

SOLVENT EXTRACTION

Solvent Extraction.
W91-00917 5D

SOUNDING

Radial Vertical Electrical Soundings: A Case Study in Groundwater Exploration.
W91-00246 2F

Deep Geoelectrical Soundings and Shapes of Curves Used for Recommendations of Bore Sites in Basaltic Terrain.
W91-00247 7B

SOUTH AFRICA

Cost Impacts of Sediments in South African Rivers.
W91-00295 2J

Spatial Variations in the Rate of Fluvial Erosion (Sediment Production) over South Africa.
W91-00635 2J

Palaeoflood Hydrology: A Tool for South Africa--An Example from the Crocodile River near Brits, Transvaal, South Africa.
W91-00636 2E

SOUTH AMERICA

Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

SOUTH CAROLINA

Superfund Record of Decision: Independent Nail, SC.
W91-00446 5G

SOUTH DAKOTA

Water Resources Data Collected During Water Year 1988 at Selected James River Basin Sites in North Dakota and South Dakota.
W91-00342 6G

Sylvan Lake Restoration Project.
W91-00562 5G

SPAIN

Analysis of Instantaneous Rainfall Rate during Flash Floods in Barcelona.
W91-00189 2B

Hydrogeochemistry of Lake Gallocanta (Aragon, NE Spain).
W91-00740 2H

Influence of Salinity on the Concentration and Rate of Interchange of Dissolved Phosphate between Water and Sediment in Fuente Piedra Lagoon (S. Spain).
W91-00743 2L

Distribution Patterns of Ostracods in Iberian Saline Lakes. Influence of Ecological Factors.
W91-00753 2H

Anostraca, Cladocera and Copepoda of Spanish Saline Lakes.
W91-00754 2H

Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

SPARTINA

Variability of Biogenic Sulfur Flux from a Temperate Salt Marsh on Short Time and Space Scales.
W91-00847 2L

SPATIAL ALLOCATION

Spatial Allocation Factor Procedures for the 1980 NAPAP (National Acid Precipitation Assessment Program) Emissions Inventory Documentation.
W91-00453 5B

SPATIAL DISTRIBUTION

Spatial Organisation of Daily Rainfall in Wales During Autumn-Winter.
W91-00115 2B

Distributions and Population Structures of Two Intertidal Estuarine Polychaetes in the Lower St. Lawrence Estuary, with Special Reference to Environmental Factors.
W91-00383 2L

Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

SPATIAL VARIATION

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

SPAWNING

Seasonal Habitat Use by Walleye in a Warmwater River System, as Determined by Radiotelemetry.
W91-00009 8I

Patterns of Fish Spawning in Hudson River Tributaries: Response to an Urban Gradient.
W91-00617 8I

SPECIES COMPOSITION

Macrophyte Associated Invertebrates and the Effect of Habitat Permanence.
W91-00052 2H

SPECIES COMPOSITION

Competition and Coexistence in Submerged Aquatic Plant Communities: The Effects of Species Interactions Versus Abiotic Factors.
W91-00423 2H

Effects of Nutrients and Water Levels on Species Composition in Prairie Whitetop (Scolochloa festucacea) Marshes.
W91-00674 2H

Microphytoplankton of Upwelling Coastal Waters (State of Rio de Janeiro): List of Species and Ecological Aspects (O Microfitoplancton das Aguas Costeiras do Litoral Fluminense (Estado do Rio de Janeiro)): Lista de Especies e Aspectos Ecologicos.
W91-00689 2L

Biology and Ecology of Brachyuran Decapod Crustaceans in the Bay/Estuary System of Santos and Sao Vincente (Sao Paulo): 1. Occurrence and Species Composition (Bioecologia de Crustaceos Decapodos, Braquiuros, No Sistema Baia-Estuario de Santos e Sao Vincente, SP: 1. Ocorrencia e Composicao).
W91-00690 2L

Creating Conditions for Changes in Prey Community Structure by Chaoborus spp. in a Lake in Sweden.
W91-00697 2H

Classification of the Macroinvertebrate Fauna of Two River Systems in Southwestern Australia in Relation to Physical and Chemical Parameters.
W91-00774 2H

SPECIES DIVERSITY

Distribution of Micro-Arthropods in Some Southern English Streams: The Influence of Physicochemistry.
W91-00419 2H

Competition and Coexistence in Submerged Aquatic Plant Communities: The Effects of Species Interactions Versus Abiotic Factors.
W91-00423 2H

Relationships Between Acidity and Benthic Invertebrates of Low-Order Woodland Streams in the Adirondack Mountains, New York.
W91-00657 5C

Phytoplankton Communities of Lakes Experimentally Acidified with Sulfuric and Nitric Acids.
W91-00659 5C

Resistance of Lotic Ecosystems to a Light Elimination Disturbance: A Laboratory Stream Study.
W91-00709 2H

Salinity as a Determinant of Salt Lake Fauna: A Question of Scale.
W91-00757 2H

Classification of the Macroinvertebrate Fauna of Two River Systems in Southwestern Australia in Relation to Physical and Chemical Parameters.
W91-00774 2H

SPECIFIC STORAGE

Specific Storage as a Poroelastic Coefficient.
W91-00607 2F

SPECIFIC YIELD

Specific Yield Estimations by Radio-Active Tracer in Indo-Gangetic Plain.
W91-00227 2F

SPECTRAL ANALYSIS

Strides in Nondestructive Testing.
W91-00676 8G

SPECTROSCOPY

Synchronous Fluorescence Spectroscopy of Dissolved Organic Matter in Surface Waters: Application to Airborne Remote Sensing.
W91-00639 5A

SPHAGNUM

Constant or Increasing Nitrogen Concentrations in Sphagnum Mosses on Mires in Southern Sweden During the Last Few Decades.
W91-00645 2H

SPILLWAYS

Air Entrainment by Spillway Aerators.
W91-00061 8B

Comprehensive Generalized Study of Scour at Cantilevered Pipe Outlets.
W91-00072 8B

SPOIL DISPOSAL

Macrofauna Distributions and Sediment Analyses from the Brunswick, Georgia Ocean Dredged Material Disposal Site and Environs.
W91-00444 5E

SPONTANEOUS POTENTIAL LOGGING

Evaluation of Hydrogeochemical Parameters with Spontaneous Potential Logs.
W91-00157 7B

SPORT FISHING

Research on the Fisheries of Small Lakes (Pienten Jarvien Kalatutkimukset).
W91-00019 8I

SPOT SATELLITE

SPOT and Environmental Studies: An Advanced System to Collect Up to Date Geographic Information.
W91-00793 7B

SPRINGS

Hydrogeologic Features of Typical Karst Terrains in Montenegro.
W91-00328 2F

Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-00336 5B

Hydrologic and Chemical Data from Selected Wells and Springs in Southern Elmore County, Including Mountain Home Air Force Base, Southwestern Idaho, Fall 1989.
W91-00440 5B

Some Characteristics of Springs in High Elevation Alteritic Material: Their Contribution to the Understanding of the Intricacy of the Two-Layered 'Sand-Basement' Aquifer (Madagascar High Plateaux) (Caracteristiques d'Emergences en Milieu Alteritique d'Altitude: Leur Apport a la Comprehension de l'Aquifere Bicouche Arenes-socle (Hauts Plateaux de Madagascar)).
W91-00856 2F

SPRUCE TREES

Depletion and Recharge of Soil Water in Two Stands of Norway Spruce (Picea abies (L.) Karst).
W91-00860 2G

SRI LANKA

Longshore-Transport Model for South Indian and Sri Lankan Coasts.
W91-00176 2L

ST LAWRENCE ESTUARY

Distributions and Population Structures of Two Intertidal Estuarine Polychaetes in the Lower St. Lawrence Estuary, with Special Reference to Environmental Factors.
W91-00383 2L

ST LAWRENCE RIVER

Evaluation of Phosphorus Loads from Ontario Municipal Wastewater Treatment Plants.
W91-00132 5D

STABLE ISOTOPES

Geochemistry of Water Associated with the Navajo Sandstone Aquifer, San Rafael Swell Area, Utah.
W91-00312 2F

STAGE-DISCHARGE RELATIONS

Steady Uniform Flow in Prismatic Channels with Flood Plains.
W91-00761 2E

STANDARDS

Professional Certification and Registration for Water-Resources and Related Disciplines.
W91-00267 6E

Case for State Certification of Water Experts.
W91-00268 6E

American Institute of Hydrology.
W91-00269 6E

Professional Registration for Geologists and Engineering Geologists.
W91-00270 6E

American Institute of Professional Geologists: Competence, Integrity, Ethics.
W91-00271 6E

Certification in the American Meteorological Society.
W91-00272 6E

Agronomists: Evaluation of Professional Competence.
W91-00273 6E

American Society for Photogrammetry and Remote Sensing Voluntary Certification Program.
W91-00274 6E

National Association of Environmental Professionals--Certification Program.
W91-00275 6E

Credentialing in the Forestry Profession.
W91-00276 6E

History of Registration of Geologists and Geophysicists in California.
W91-00277 6E

Professional Registration for Hydrologists in Arizona: A Proposal Prepared by the Arizona Hydrological Society.
W91-00278 6E

Engineering Specialty Certification.
W91-00279 6E

Regulatory Effects on the Practice of Drinking Water Treatment.
W91-00483 5F

Evaluating the Probability of Violating Dissolved Oxygen Standard.
W91-00715 5G

STANDING WAVES

Wave Type Flow at Abrupt Drops.
W91-00042 2E

STATE JURISDICTION

Ground-water-management Areas in United States.
W91-00182 4B

Principles of a Ground-water Strategy.
W91-00183 6A

Case for State Certification of Water Experts.
W91-00268 6E

Credentialing in the Forestry Profession.
W91-00276 6E

Professional Registration for Hydrologists in Arizona: A Proposal Prepared by the Arizona Hydrological Society.
W91-00278 6E

STATISTICAL ANALYSIS
Hydroclimatic Application Strategy for the Poisson Partial Duration Model.
W91-00084 2E

Use of Statistical Methods in Industrial Water Pollution Control Regulations in the United States.
W91-00125 5G

Continuous Effluent Consents: Modelling and Compliance Testing.
W91-00126 5G

Auditing the Quality of Effluent Discharges.
W91-00127 5G

State Estimation in Wastewater Engineering: Application to an Anaerobic Process.
W91-00130 5D

Some Comments on Analysis Techniques for Censored Water Quality Data.
W91-00131 5G

Status of the Niagara River Point Source Discharge Information: Sampling Design and Estimation of Loading.
W91-00134 5B

Inferences About Point Source Loading from Upstream/Downstream River Monitoring Data.
W91-00135 5B

Measures of Flow Variability for Great Lakes Tributaries.
W91-00136 2E

Statistical Zonation of Sediment Samples Using Ratio Matching and Cluster Analysis.
W91-00137 2J

Development of a Software Package for Trend Detection in Temporal Series: Application to Water and Industrial Effluent Quality Data for the St. Lawrence River.
W91-00139 5B

Hysteresis and Nonlinearity of Discharge-Sediment Relationships in the Atchafalaya and Lower Mississippi Rivers.
W91-00292 2J

Bias and Variance of some Estimators of Suspended Sediment Load.
W91-00406 2J

Distribution of Micro-Arthropods in Some Southern English Streams: The Influence of Physicochemistry.
W91-00419 2H

Simplified Methods of Estimating Daily Mean Stream Water Temperature.
W91-00421 2E

Basis of Hydro-Climatic Time Series in Greenland.
W91-00469 7C

Toward Empirical Estimation of the Total Value of Protecting Rivers.
W91-00584 6B

Cokriging to Assess Regional Stream Quality in the Southern Blue Ridge Province.
W91-00589 5B

Multivariate Analysis of Diatoms and Water Chemistry in Bolivian Saline Lakes.
W91-00758 2H

Influence of Outliers on Results of Wet Deposition Measurements as a Function of Measurement Strategy.
W91-00849 5B

Source-Receptor Relationships for Wet SO4(2-) and NO3(-) Production.
W91-00851 5B

Monitoring Spatial Variability of Forest Interception.
W91-00861 2D

Geostatistical Methods for Detection of Outliers in Groundwater Quality Spatial Fields.
W91-00894 2F

Classification of Shallow Groundwater Types in a Dutch Coversand Landscape.
W91-00895 2K

Accuracy of the Maximum Recorded Depth in Extreme Rainstorms.
W91-00966 2B

STATISTICAL DISAGGREGATION
Dynamic Model for Short-scale Rainfall Disaggregation.
W91-00409 2B

STATISTICAL METHODS
Estimating Statistical Parameters for an N-Segment Discrete Hydrologic Data Series.
W91-00074 2E

Use of Statistical Methods in Industrial Water Pollution Control Regulations in the United States.
W91-00125 5G

Some Comments on Analysis Techniques for Censored Water Quality Data.
W91-00131 5G

Status of the Niagara River Point Source Discharge Information: Sampling Design and Estimation of Loading.
W91-00134 5B

Some Fundamental Weak Spots of Kriging Technique and Their Consequences.
W91-00159 7C

Fuzzy Regression in Hydrology.
W91-00596 7C

Depletion and Recharge of Soil Water in Two Stands of Norway Spruce (Picea abies (L.) Karst).
W91-00860 2G

STATISTICAL MODELS
Statistics-Based System for Treatment Plant Operation.
W91-00129 5D

State Estimation in Wastewater Engineering: Application to an Anaerobic Process.
W91-00130 5D

Dynamic Model for Short-scale Rainfall Disaggregation.
W91-00409 2B

Droughts and Floods: Their Definition and Modeling.
W91-00992 2E

STATISTICAL STUDIES
Estimation of Phosphorus from the Niagara River to Lake Ontario.
W91-00133 5E

STATISTICS
Statistics-Based System for Treatment Plant Operation.
W91-00129 5D

State Estimation in Wastewater Engineering: Application to an Anaerobic Process.
W91-00130 5D

Characteristics of Streamflow Drought.
W91-00994 2E

STEADY FLOW
Improved Method of Calculation for Steady Uniform Flow in Prismatic Main Channel/Flood Plain Sections.
W91-00038 8B

STEAM STRIPPING
Air Stripping and Steam Stripping.
W91-00919 5D

STEEL
Stainless Steel in Wastewater Treatment Plants.
W91-00628 5D

STILLING BASINS
Hydraulic Jumps at Positive and Negative Steps.
W91-00034 8B

STOCHASTIC HYDROLOGY
State Space Approach to the Behavior of Sewer Systems.
W91-00375 5D

Dynamic Model for Short-scale Rainfall Disaggregation.
W91-00409 2B

STOCHASTIC MODELS
Effect of Drought on Urban Water Supplies. I: Drought Analysis.
W91-00059 6D

Effect of Drought on Urban Water Supplies. II: Water-Supply Analysis.
W91-00060 6D

Modeling Infiltration in Hysteretic Soils.
W91-00118 2G

Physics-Based Approach to Stochastic Hydrology of First-Order Drainage Basins.
W91-00968 2E

Entropy Based Method for Flood Forecasting.
W91-00972 2E

STOMACH
Chlorinated Organic By-products of the Reaction of N-Chloropiperidine with Stomach Fluid from Laboratory Animals.
W91-00538 5B

STORAGE COEFFICIENT
Specific Storage as a Poroelastic Coefficient.
W91-00607 2F

STORAGE REQUIREMENTS
Errors in Estimated Streamflow Parameters and Storages for Ungauged Catchments.
W91-00085 2E

STORAGE TANKS
Underground Storage Tanks.
W91-00904 5G

STORM RUNOFF
Utility Approach to Stormwater Management.
W91-00104 4A

Storm Runoff and its Effects on the Water Quality and Bottom-Material Quality of Cedar Creek, West-Central Illinois, 1985-6.
W91-00339 5B

Logging Effects on Streamflow: Storm Runoff at Caspar Creek in Northwestern California.
W91-00610 4C

Sediment Yield and Discharge in Mountainous Small River Basins: Actual Condition of Sediment Discharge After Damage Caused by Sand and Stone Avalanches (in Japanese).
W91-00766 2J

Urban Storm-Induced Discharge Impacts.
W91-00803 4A

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

Using GIS to Assess Spatial Variability of SCS Curve Number at the Basin Scale.
W91-01004 2E

STORM WASTEWATER
Design of Detention Basins for Industrial Sites.
W91-00188 5D

STORM WATER
Design of Detention Basins for Industrial Sites.
W91-00188 5D

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

STORM WATER MANAGEMENT
Utility Approach to Stormwater Management.
W91-00104 4A

Radar Rainfall Forecasting Method Designed for Hydrological Purposes.
W91-00156 7B

Single-Outlet Detention-Pond Analysis and Design.
W91-00171 8A

STORMS
Influence of Upwellings, Storms, and Generating Station Operation on Water Chemistry and Plankton in the Nanticoke Region of Long Point Bay, Lake Erie.
W91-00662 2H

STRATIFICATION
Vernal Microstratification Patterns in a Meromictic Saline Lake: Their Causes and Biological Significance.
W91-00745 2H

STRATIFIED FLOW
Classification of Unidirectional Three-layer Flow Over a Hump.
W91-00041 8B

Locating and Identifying Hydraulic Controls for Layered Flow Over an Obstruction.
W91-00374 2L

STRATIGRAPHY
Pigment Stratigraphy and Trophic Status: An Evaluation of Radionuclide-Dated Lacustrine Sediment.
W91-00692 2H

STRATOSPHERIC AEROSOL AND GAS EXPERIMENT
Observations of Atmospheric Water Vapor with the SAGE II Instrument.
W91-00579 7B

STREAM BIOTA
Resource Limitation in a Stream Community: Phosphorus Enrichment Effects on Periphyton and Grazers.
W91-00618 2H

Response of a Brook Trout (Salvelinus fontinalis) Population to a Reduction in Stream Benthos Following an Insecticide Treatment.
W91-00660 5C

Effects of Sediment and Flow Regime on the Aquatic Insects of a High Mountain Stream.
W91-00776 2H

Studies on the Algae of a Small Softwater Stream I. Occurrence and Distribution with Particular Reference to the Diatoms.
W91-00869 2H

Studies on the Algae of a Small Softwater Stream II. Algal Standing Crop (Measured by Chlorophyll-a) on Soft and Hard Substrata.
W91-00870 2H

Studies on the Algae of a Small Softwater Stream III. Interaction between Discharge, Sediment Composition and Diatom Flora.
W91-00871 2H

STREAM DEGRADATION
Degradation of a Stream Crossing the City of Addis Ababa, Ethiopia.
W91-00680 5C

STREAM DISCHARGE
Measures of Flow Variability for Great Lakes Tributaries.
W91-00136 2E

Rainfall-Runoff Relations Derived from the Probability Theory of Storage.
W91-00592 2E

STREAM ECOLOGY
Seasonal Variation of Sirodotia delicatula Skuja (Rhodophyta, Batrachospermaceae) in a Small Stream From Sao Paulo State, Southeastern Brazil.
W91-00782 2H

STREAM EROSION
Influence of Sand or Gravel on the Erosion of Cohesive Sediment.
W91-00095 2J

Spatial Variations in the Rate of Fluvial Erosion (Sediment Production) over South Africa.
W91-00635 2J

STREAM FISHERIES
Populations, Growth, Biomass and Production of Fish in a Small Stream in North-West Poland.
W91-00007 2H

Seasonal Habitat Use by Walleye in a Warmwater River System, as Determined by Radiotelemetry.
W91-00009 8I

Evaluation of Trout Passage Through Six Highway Culverts in Montana.
W91-00012 8I

Stream Canopy and Its Relationship to Salmonid Biomass in the Intermountain West.
W91-00013 8I

Testing of Habitat Assessment Models for Small Trout Streams in the Medicine Bow National Forest, Wyoming.
W91-00014 8I

Salmon Stocks and Salmon Fisheries in the Baltic Sea (Itameren Lohikannat ja Lohenkalastus).
W91-00015 8I

Salmon of the River Simojoki: Research and Management (Simojoen Lohi Tutkimuksen ja Hoidon Kohteena).
W91-00016 8I

Reintroduction of Salmon and Sea Trout into the Vantaanjoki and Kymijoki Rivers (Lohen ja Meritaimenen Palautttaminen Vantaanjokeen ja Kymijokeen).
W91-00017 8I

Fishes of Bullitt County, Kentucky.
W91-00108 4C

STREAM GAGES
Cost Effectiveness of the Streamflow-Gaging Program in West Virginia.
W91-00331 2E

STREAM POLLUTION
Measures of Flow Variability for Great Lakes Tributaries.
W91-00136 2E

Degradation of a Stream Crossing the City of Addis Ababa, Ethiopia.
W91-00680 5C

Relationships Between Copper Concentrations in Larvae of Plectrocnemia conspersa (Curtis) (Trichoptera) and in Mine Drainage Streams.
W91-00859 5B

STREAM PROFILES
Deriving Stream Parameters for Hydrologic Modeling from Digital Elevation Data.
W91-01000 2E

STREAM REGULATION
Effect of Regulation on 0+ Fish Recruitment in the Great Ouse, A Lowland River.
W91-00777 6G

Assessing Options for Stream Regulation Using Hydrologic Simulations and Cumulative Impact Analysis: Flathead River Basin, USA.
W91-00779 2E

STREAMBEDS
Velocity Distribution in Alluvial Channel Flow.
W91-00036 8B

Bed Form Resistances in Open Channel Flows.
W91-00063 8B

Water Temperature in a Stream Gravel Bed and Implications for Salmonid Incubation.
W91-00427 8I

STREAMFLOW
Prediction of Flow Characteristics in Main Channel/Flood Plain Flows.
W91-00073 8B

Conversion of Braided Gravel-Bed Rivers to Single-Thread Channels of Equivalent Transport Capacity.
W91-00078 2J

Reconstruction of the Recent Flow History of a Braided Gravel River.
W91-00079 2E

Errors in Estimated Streamflow Parameters and Storages for Ungauged Catchments.
W91-00085 2E

Stormflow and Sediment Loss from Intensively Managed Forest Watersheds in East Texas.
W91-00087 4C

Temporal Lag Effect in Bed Load Sediment Transport.
W91-00093 2J

Explicit Methods for 2-D Transient Free-surface Flows.
W91-00151 2E

Cost Effectiveness of the Streamflow-Gaging Program in West Virginia.
W91-00331 2E

Comparison of Tracer-Dilution and Current-Meter Discharge Measurements in a Small Gravel-Bed Stream, Little Lost Man Creek, California.
W91-00337 2E

Logging Effects on Streamflow: Storm Runoff at Caspar Creek in Northwestern California.
W91-00610 4C

Logging Effects on Streamflow: Water Yield and Summer Low Flows at Caspar Creek in Northwestern California.
W91-00611 3B

Diurnal Fluctuation in Stream Flow and in Specific Electric Conductance During Drought Periods.
W91-00881 2E

Real-Time Intercomparison of Hydrological Models.
W91-00974 2A

Regionalization of Low Flow Characteristics Using Logistic and GLS Regression.
W91-00993 2E

Characteristics of Streamflow Drought.
W91-00994 2E

Deriving Stream Parameters for Hydrologic Modeling from Digital Elevation Data.
W91-01000 2E

STREAMFLOW DATA

Measures of Flow Variability for Great Lakes Tributaries.
W91-00136 2E

Streamflow and Water-Quality Data for Little Scrubgrass Creek Basin, Venango and Butler Counties, Pennsylvania, December 1987 - November 1988.
W91-00357 2E

Streamflow and Water-Quality Data for Meadow Run Basin, Fayette County, Pennsylvania, December 1987 - November 1988.
W91-00431 5B

STREAMFLOW FORECASTING

Errors in Estimated Streamflow Parameters and Storages for Ungauged Catchments.
W91-00085 2E

Streamflow Simulation Using Deterministic Model.
W91-00174 2E

Regional Flow-duration Curves for Ungauged Sites in Massachusetts.
W91-00185 2E

Evaluation of Automated Techniques for Base Flow and Recession Analyses.
W91-00593 2E

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 1. Models, Model Properties, and Experimental Design.
W91-00604 2A

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 2. Hydrologic Responses for Normal and Extreme Rainfall.
W91-00605 2A

Daily Flow Forecasting with Regression Analysis.
W91-00634 2E

Use of Satellite Derived Rainfall Estimates as Inputs to Flow Prediction in the River Senegal.
W91-00964 2B

Entropy Based Method for Flood Forecasting.
W91-00972 2E

STREAMS

Input and Depletion of Woody Debris in Alaska Streams and Implications for Streamside Management.
W91-00011 4C

Storm Runoff and its Effects on the Water Quality and Bottom-Material Quality of Cedar Creek, West-Central Illinois, 1985-6.
W91-00339 5B

Distribution of Micro-Arthropods in Some Southern English Streams: The Influence of Physicochemistry.
W91-00419 2H

Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

Simplified Methods of Estimating Daily Mean Stream Water Temperature.
W91-00421 2E

Interactions Among Nutrients, Algae and Invertebrates in a New Zealand Mountain Stream.
W91-00422 2E

Water Temperature in a Stream Gravel Bed and Implications for Salmonid Incubation.
W91-00427 8I

Hydrologic and Water-Quality Data for Streams and Impoundments in the Coteau des Prairies--Upper Minnesota River Basin, 1979-84.
W91-00434 2E

Cokriging to Assess Regional Stream Quality in the Southern Blue Ridge Province.
W91-00589 5B

Gas Exchange Rates for a First-Order Stream Determined with Deliberate and Natural Tracers.
W91-00606 2A

Resistance of Lotic Ecosystems to a Light Elimination Disturbance: A Laboratory Stream Study.
W91-00709 2H

STROMATOLITES

Lake Thetis, Western Australia: An Example of Saline Lake Sedimentation Dominated by Benthic Microbial Processes.
W91-00655 2H

STRONTIUM

Hydrochemistry from Sr and Mg Contents of Ostracodes in Pleistocene Lacustrine Deposits, Baza Basin (SE Spain).
W91-00759 2H

STRUCTURAL BEHAVIOR

Shake Table Test of Cylindrical Water Tanks in Base-Isolated Structures.
W91-00147 8E

STRUCTURE-ACTIVITY RELATIONSHIPS

Comparative QSAR Study on Freshwater and Estuarine Toxicity.
W91-00195 5C

SUBLETHAL EFFECTS

Acute Toxicity, Sublethal Effects, and Bioconcentration of Chlorination Products, Viruses, and Bacteria in Edible Shellfish: A Review.
W91-00515 5C

Effects of Nickel on Daphnia Magna During Chronic Exposure and Alterations in the Toxicity to Generations Pre-Exposed to Nickel.
W91-00808 5C

Relationships Between Copper Concentrations in Larvae of Plectrocnemia conspersa (Curtis) (Trichoptera) and in Mine Drainage Streams.
W91-00859 5B

SUBMERGED FLOW

Discharge characteristics of Local Discontinuous Contractions, II.
W91-00762 8B

SUBMERGED PLANTS

Competition and Coexistence in Submerged Aquatic Plant Communities: The Effects of Species Interactions Versus Abiotic Factors.
W91-00423 2H

SUBSTRATES

Biodegradation Kinetics of Substituted Phenolics: Demonstrations of a Protocol Based on Electrolytic Respirometry.
W91-00809 5B

SUBSURFACE IRRIGATION

Real Time Simulation Model as a Decision Support System for Surface Water Management.
W91-00998 4A

SUBSURFACE MAPPING

Ground-Water Data for Georgia, 1988.
W91-00432 2F

Hydrogeology and Water Quality of Significant Sand and Gravel Aquifers in Parts of Aroostook County, Maine: Significant Sand and Gravel Aquifer Maps 75, 76, 77, 78, 84, and 85.
W91-00435 2F

SUBTROPIC ZONE

Geomorphological Effects of Catastrophic Flooding on a Small Subtropical Estuary.
W91-00049 2J

SUBURBAN AREAS

Effects of Suburbanization upon Snowmelt Runoff.
W91-00408 2E

SUCCESSION

Divergent Successions in Mires, a Comparative Study.
W91-00646 2H

Phytoplankton Communities of Lakes Experimentally Acidified with Sulfuric and Nitric Acids.
W91-00659 5C

Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

SULFATES

Wet Deposition of Volcanic Gases and Ash in the Vicinity of Mount Sakurajima.
W91-00669 5B

Mesoscale Modeling of Acidity Production in Orographic Clouds and Rain.
W91-00671 5B

Chemical Characterization of Acid Precipitation in Albany, New York.
W91-00850 5A

Source-Receptor Relationships for Wet SO4(2-) and NO3(-) Production.
W91-00851 5B

Chemical Composition Differences in Fog and Cloud Droplets of Different Sizes.
W91-00854 2B

SULFIDES

Case Histories of Sulfide Corrosion: Problems and Treatments.
W91-00768 8G

SULFITES
Method for Determining the Completeness of Dechlorination with Sulfite.
W91-00532 5D

SULFUR
Oxidation of S(IV) in Rain-Water Collected in Japan.
W91-00668 5B

SULFUR BACTERIA
Occurrence of Hypolimnetic Blooms of the Purple Sulfur Bacterium, Thiopedia rosea, and the Green Sulfur Bacterium, Chlorobium limicola, in an Australian Reservoir.
W91-00652 5C

SULFUR COMPOUNDS
Variability of Biogenic Sulfur Flux from a Temperate Salt Marsh on Short Time and Space Scales.
W91-00847 2L

SULFURIC ACID
Phytoplankton Communities of Lakes Experimentally Acidified with Sulfuric and Nitric Acids.
W91-00659 5C

Atmospheric Chemistry of Peroxides: A Review.
W91-00841 5B

SUMMER
Summertime Sampling.
W91-00111 5A

SUPERCRITICAL WET OXIDATION
Supercritical-Water Oxidation.
W91-00939 5D

SUPERFUND
Five Worst Superfund Design Mistakes.
W91-00363 5G

Superfund Record of Decision, Broderick Wood Products Company.
W91-00555 5G

Superfund Record of Decision Midwest Manufacturing, IO.
W91-00556 5G

Superfund Record of Decision, John Deere Dubuque Works, IA.
W91-00559 5G

Point-of-Entry Drinking Water Treatment Systems for Superfund Applications.
W91-00572 5F

Hazardous-Waste Treatment Comes of Age.
W91-00901 5G

Summary of CERCLA Legislation and Regulations and the EPA Superfund Program.
W91-00903 6E

SUPERFUND SITES
Hydrogeology and Simulation of Ground-Water Flow at Superfund-Site Wells G and H, Woburn, Massachusetts.
W91-00340 2F

Superfund Record of Decision: Velsicol Chemical Corporation, IL.
W91-00445 5G

Superfund Record of Decision: Independent Nail, SC.
W91-00446 5G

Superfund Record of Decision: French Limited, TX.
W91-00447 5G

Superfund Record of Decision: Beachwood/Berkeley, NJ.
W91-00451 5G

SURFACE FLOW
Topographic Effects on Flow Path and Surface Water Chemistry of the Llyn Brianne Catchments in Wales.
W91-00888 2E

SURFACE-GROUNDWATER RELATIONS
Modeling Infiltration in Hysteretic Soils.
W91-00118 2G

One-dimensional Interactive Soil-atmosphere Model for Testing Formulations of Surface Hydrology.
W91-00145 2A

Estimating Groundwater Recharge Using a Surface Watershed Modelling Approach.
W91-00160 2F

Estimating Groundwater Recharge Using a Surface Watershed Model: Sensitivity Analyses.
W91-00161 7C

Spatially Continuous Determination of Groundwater Flow to Surface Water Bodies: Application to the Connecting Channels Between Lakes Huron and Erie.
W91-00163 2A

Management and Conservation of Ground Water Resource Through Point Dilution Technique Using Radiotracer - Some Case Histories.
W91-00229 4B

Use of Single Well Dilution Technique for Seepage Measurements from Canals Using Radio-Active Tracer.
W91-00230 2F

Role of Ground Water in Controlling Ecology of Area: A Case Study of Ghana Bird Sanctuary - District Bharatpur, Rajasthan.
W91-00234 6G

Environmental Isotope-Aided Study on River Water and Groundwater Interaction in the Region of Seoul and Taegu.
W91-00257 2A

Conjunctive Use for Irrigation Development in Alluvial Regions: Problems, Prospects and Research Issues.
W91-00261 3F

Subsurface Transport of Inorganic and Organic Solutes from Experimental Road Spreading of Oil-Field Brine.
W91-00365 5B

Gas Exchange Rates for a First-Order Stream Determined with Deliberate and Natural Tracers.
W91-00606 2A

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.
W91-00864 2G

Diurnal Fluctuation in Stream Flow and in Specific Electric Conductance During Drought Periods.
W91-00881 2E

Groundwater Response to Reforestation in the Darling Range of Western Australia.
W91-00892 2F

Using Rn222 to Examine Groundwater/Surface Discharge Interaction in the Rio Grande de Manati, Puerto Rico.
W91-00893 2F

Conceptual Model Simulating the Hydrological Processes on a Drainage Basin in a Plain Area.
W91-00981 2E

Effects of Recharge Systems on Hydrological Information Transfer Along Rivers.
W91-00984 2E

SURFACE IMPOUNDMENTS
Surface Impoundments.
W91-00951 5E

SURFACE RUNOFF
Design of Detention Basins for Industrial Sites.
W91-00188 5D

Soil Erosion and Floodplain Soil Pollution: Related Problems in the Geographical Context of a River Basin.
W91-00289 5B

Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

SURFACE WATER
Streamflow and Water-Quality Data for Little Scrubgrass Creek Basin, Venango and Butler Counties, Pennsylvania, December 1987 - November 1988.
W91-00357 2E

National Water Information System User's Manual Volume 2, Chapter 3. Automated Data Processing System.
W91-00442 7C

Synchronous Fluorescence Spectroscopy of Dissolved Organic Matter in Surface Waters: Application to Airborne Remote Sensing.
W91-00639 5A

New Directions for Surface Water Modeling.
W91-00961 7C

Real Time Simulation Model as a Decision Support System for Surface Water Management.
W91-00998 4A

Intelligent Geographic Information Systems (IGIS) and Surface Water Modeling.
W91-01001 4A

SURFACE WATER DATA
Streamflow and Water-Quality Data for Meadow Run Basin, Fayette County, Pennsylvania, December 1987 - November 1988.
W91-00431 5B

Regional Water Quality: Evaluation of Data for Assessing Conditions and Trends.
W91-00619 7A

SURVEYS
Pilot Studies for Designs of Surveys of Human Disturbance of Intertidal Habitats in New South Wales.
W91-00685 4C

Predicting Success of Walleye Stocking Programs in the United States and Canada.
W91-00691 8I

SUSPENDED LOAD
One-Dimensional Model for the Transport of a Sediment Mixture in Non-Equilibrium Conditions.
W91-00070 2J

Placer Mining Operations and Modifications of the Physical Chemical Nature of the Waters of the Rio Kaka Drainage Basin (Andes, Bolivia).
W91-00293 5B

SUSPENDED SEDIMENTS
Development and Structure of the Goczalkowice Reservoir Ecosystem. XIX. Suspended-Matter Sedimentation.
W91-00005 2H

Depth-Integrated Model for Suspended Sediment Transport.
W91-00033 2J

Concentration of Very Fine Silts in a Steady Vortex.
W91-00035 2J

Transport of Mine Tailings as Suspended Sediment in the Belle Fourche River, West-Central South Dakota, USA.
W91-00283 5B

Rate of Sedimentation and Geochemistry of Southeastern Hudson Bay, Canada.
W91-00284 2J

Cross-Sectional Variability in Suspended Sediment and Associated Trace Element Concentrations in Selected Rivers in the US.
W91-00287 2J

Case Study of Approaches for Determining Diffuse Suspended Sediment Sources and Processes.
W91-00290 2J

Benthic Macrofauna and Ancillary Data for San Francisco Bay, California, January to November 1988.
W91-00343 2L

Bias and Variance of some Estimators of Suspended Sediment Load.
W91-00406 2J

SUSPENDED SOLIDS
Mathematical Modelling of the Effect of Size Distribution on Suspended Particles in Deep-Bed Filtration.
W91-00022 5F

Flocculation of Suspended Solids in Southern Ontario Rivers.
W91-00291 2J

Placer Mining Operations and Modifications of the Physical Chemical Nature of the Waters of the Rio Kaka Drainage Basin (Andes, Bolivia).
W91-00293 5B

Specifer's Guide to Polymer Feed Systems.
W91-00402 5D

SWAMPS
Periodic Moisture Fluctuation as a Factor Affecting Mire Vegetation.
W91-00644 2H

Synopsis and Numerical Analysis of the Pre-, Sub-, and Low-Alpine Mire Vegetation of the Uleberg-Skrubben Area, North Norway.
W91-00647 2H

SWEDEN
Comparative Development of Bogs and Fens in Central Sweden: Evaluating the Role of Climate Change and Ecosystem Development.
W91-00641 2H

Constant or Increasing Nitrogen Concentrations in Sphagnum Mosses on Mires in Southern Sweden During the Last Few Decades.
W91-00645 2H

Creating Conditions for Changes in Prey Community Structure by Chaoborus spp. in a Lake in Sweden.
W91-00697 2H

Negative Oxygen Trends in Swedish Coastal Bottom Waters.
W91-00703 2K

Trace Metal Wet Deposition in Sweden: Insight Gained from Daily Wet Only Collection.
W91-00853 5B

SWIMMING POOLS
Trihalomethanes: Is Swimming Pool Water Hazardous.
W91-00484 5F

SYLVAN LAKE
Sylvan Lake Restoration Project.
W91-00562 5G

SYNTHETIC COMPOUNDS
SOC (Synthetic Organic Compounds) Rejection by Nanofiltration.
W91-00449 5F

SYSTEMS ANALYSIS
Present and Future Perspectives of Water Resources in Developed Countries.
W91-00067 6A

TAEGU
Environmental Isotope-Aided Study on River Water and Groundwater Interaction in the Region of Seoul and Taegu.
W91-00257 2A

TANZANIA
Evolution of Saline Lake Waters: Gradual and Rapid Biogeochemical Pathways in the Basotu Lake District, Tanzania.
W91-00739 2H

TAR
Beach Tar Contamination in Jamaica.
W91-00702 5B

TELEMETRY
Remote Data Collection and Control for Hydrogeologic Monitoring.
W91-00370 7B

Satellite Teletransmission: Technology Applied to Hydrological Forecasting. An Example of the Fight against Onchocercosis (La Teletransmission par Satellite: Une Technologie Adaptee a la Prevision Hydrologique. Exemple de la Lutte contre l'Onchocerose).
W91-00475 7B

Large-Scale Patterns of Nodularia spumigena Blooms in Pyramid Lake, Nevada, Determined from Landsat Imagery: 1972-1986.
W91-00749 2H

Towards an Improved System for Weather Radar Calibration and Rainfall Forecasting Using Raingauge Data from a Regional Telemetry System.
W91-00963 2B

TEMPERATURE EFFECTS
Relating Nimbus-7 GHz Data to Land Surface Evaporation.
W91-00461 7B

Photosynthesis of Dunaliella parva Lerche as a Function of Temperature, Light and Salinity.
W91-00750 2H

TEMPERATURE GRADIENT
Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

TEMPORAL DISTRIBUTION
Effects of Invertebrate Predation on the Seasonal Succession of a Zooplankton Community: A Two Year Study in Lake Aydat, France.
W91-00694 2H

TEMPORAL LAG
Temporal Lag Effect in Bed Load Sediment Transport.
W91-00093 2J

TERATOGENIC EFFECTS
Age-dependent Changes in Toxicity of N-Nitroso Compounds to Japanese Medaka (Oryzias latipes) Embryos.
W91-00194 5C

TESTING PROCEDURES
Simple Continuous-Flow Toxicity Test System for Microscopic Life Stages of Aquatic Organisms.
W91-00814 5A

Sampling and Analysis of Hazardous Wastes.
W91-00958 5A

TEXAS
Sludge Disposal, Dallas Style.
W91-00143 5E

Superfund Record of Decision: French Limited, TX.
W91-00447 5G

Microtunneling Techniques Aid Sewer Installation.
W91-00773 8A

THE NETHERLANDS
Mineralization, Pore Water Chemistry and Phosphorus Release from Peaty Sediments in the Eutrophic Loosdrecht Lakes, The Netherlands.
W91-00426 2H

Classification of Shallow Groundwater Types in a Dutch Coversand Landscape.
W91-00895 2K

THEORETICAL ANALYSIS
Specific Storage as a Poroelastic Coefficient.
W91-00607 2F

Perturbation Solution of the Flood-Routing Problem.
W91-00763 7C

Control of Phytoplankton Growth in Nutrient Recycling Ecosystems. Theory and Terminology.
W91-00765 2H

THERMAL OXIDATION
Fluidized-Bed Thermal Oxidation.
W91-00932 5D

THERMAL POLLUTION
Influence of Upwellings, Storms, and Generating Station Operation on Water Chemistry and Plankton in the Nanticoke Region of Long Point Bay, Lake Erie.
W91-00662 2H

THERMAL PROPERTIES
Zero-Curtain Effect: Heat and Mass Transfer Across an Isothermal Region in Freezing Soil.
W91-00597 2C

THERMAL RADIATION
HAPEX-MOBILHY: Results from a Large-Scale Field Experiment.
W91-00456 7B

THERMAL STRATIFICATION
Laterally Averaged Hydrodynamics Model for Reservoir Predictions.
W91-00062 2H

THERMODYNAMICS
Physical Chemical Properties of Uncharged Water Clusters and One-Dimensional Ice Based on Quantal Calculations.
W91-00667 2C

Monthly Variations in Entropy Production in Lake Biwa.
W91-00717 2H

THIN-FILM EVAPORATION
Thin-Film Evaporation.
W91-00920 5D

THROUGHFALL
Rainfall Interception in the Tai Forest, Ivory Coast: Application of Two Simulation Models to a Humid Tropical System.
W91-00158 2B

Estimates of Ion Sources in Deciduous and Coniferous Throughfall.
W91-00415 5B

TIDAL CURRENTS
Tidal Flow Simulation in the English Channel and Southern North Sea.
W91-00047 2L

Simulation of the Tidal Flow in the English Channel and the Southern North Sea by a Curvilinear Finite Difference Model.
W91-00048 2L

TIDAL EFFECTS
Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

Motion of Coastal Groundwater in Response to the Tide.
W91-00884 2F

TIDAL FLATS
Effect of Tidal Action on the Transformations of Nitrogen in Freshwater Tidal Flat Sediments.
W91-00649 5B

Seasonal Variation in the Structure of the Microbial Community Capable of Nitrate Respiration in an Intertidal Mud Flat Sediment from the Elbe Estuary.
W91-00650 2L

TIDAL RIVERS
Ecology of Marine Benthic Dipterans in a Tidal Creek of Hooghly Estuary, Sagar Island, India.
W91-00051 2L

TIDES
Tides in the English Channel and Southern North Sea. A Frequency Domain Analysis Using Model TEA-NL.
W91-00045 2L

Comparison of Two Finite Element Models of Tidal Hydrodynamics Using a North Sea Data Set.
W91-00046 2L

TIGRIS RIVER
Bacterial Pollution of the River Tigris.
W91-00392 5B

TILAPIA
Effect of Cadmium on Blood of Tilapia, Oreochromis mossambicus (Peters), During Prolonged Exposure.
W91-00214 5C

Estimation of the Critical Oxygen Tension for and Recovering Capabilities of Red Tilapia (Oreochromis niloticus X Oreochromis mossambicus) Hybrids.
W91-00683 2H

TILLAGE
Nitrogen and Phosphorus in Eroded Sediment from Corn and Soybean Tillage Systems.
W91-00281 5B

Cropping Systems Effects on Runoff, Erosion, Water Quality, and Properties of a Savanna Soil at Ilorin, Nigeria.
W91-00288 5B

TIME SERIES ANALYSIS
Time Series Analysis of Unequally Spaced Observations-With Applications to Copper Contamination of the River Gaula in Central Norway.
W91-00128 5B

Robust Graphical Methods for Diagnosing Trend in Irregularly Spaced Water Quality Time Series.
W91-00138 5B

Basis of Hydro-Climatic Time Series in Greenland.
W91-00469 7C

TOADS
Heavy Metal Contamination in the River Toad, Bufo juxtasper (Inger), Near a Copper Mine in East Malaysia.
W91-00209 5B

TOKYO
Water Supply in Fast-Growing Cities: Tokyo, Japan.
W91-00021 6D

TOPOGRAPHY
Topographic Effects on Flow Path and Surface Water Chemistry of the Llyn Brianne Catchments in Wales.
W91-00888 2E

TOSTON DAM
Effect of Toston Dam on Upstream Ice Conditions.
W91-00574 6G

TOXIC WASTES
Bioremediation Comes of Age.
W91-00400 5G

TOXICITY
Aspects of Carbon Metabolism in the Recovery of Selenastrum capricornutum Populations Exposed to Cadmium.
W91-00191 5C

Age-dependent Changes in Toxicity of N-Nitroso Compounds to Japanese Medaka (Oryzias latipes) Embryos.
W91-00194 5C

Comparative QSAR Study on Freshwater and Estuarine Toxicity.
W91-00195 5C

Modeling the Effect of Algal Biomass on Multispecies Aquatic Microcosms Response to Copper Toxicity.
W91-00197 5C

Functional and Pathological Impairment of Japanese Medaka (Oryzias latipes) by Long-term Asbestos Exposure.
W91-00199 5C

Arsenic-induced Ultrastructural Changes in the Vegetative Cells of Cystoseira barbata forma repens Zinova et Kalugina (Fucophyceae, Fucales).
W91-00202 5C

Carcinogenicity of Chlorinated Acetic Acids.
W91-00492 5C

Toxicological Effects Associated with Drinking Water Disinfectants and Their By-products.
W91-00497 5C

Biochemical Mechanisms of In Vitro Chloropropanone Toxicity.
W91-00502 5C

Toxicity and Fate of Total Residual Chlorine in Outdoor Experimental Streams.
W91-00513 5C

Chlorine Sensitivity of Early Life Stages of Freshwater Fish.
W91-00514 5C

Acute Toxicity, Sublethal Effects, and Bioconcentration of Chlorination Products, Viruses, and Bacteria in Edible Shellfish: A Review.
W91-00515 5C

Plasma Electrolytes, Gill Aluminum Content, and Gill Morphology of Juvenile Atlantic Salmon (Salmo salar) and Brook Trout (Salvelinus fontinalis) Indigenous to Acidic Streams of Nova Scotia.
W91-00616 5C

Inferred Effects of Lake Acidification on Daphnia galeata mendotae.
W91-00626 5C

Effect of Fluoride Complexation on Aluminum Toxicity Towards Juvenile Atlantic Salmon (Salmo salar).
W91-00663 5C

Lead Poisoning in Magpie Geese Anseranus semipalmata from Ingested Lead Pellet at Bool Lagoon Game Reserve (South Australia).
W91-00687 5C

Arsenate Sensitivity in Marine Periphyton Communities Established Under Various Nutrient Regimes.
W91-00700 5C

Comparative Study of Toxic Lead Effect on Gill and Hemoglobin of Tilapia Fish.
W91-00722 5A

Mechanism of Toxicity of Zinc to the Marine Diatom Nitzschia closterium.
W91-00729 5C

Implications of Heavy Metal Toxicity Related to EDTA Exposure.
W91-00792 5C

Effects of Nickel on Daphnia Magna During Chronic Exposure and Alterations in the Toxicity to Generations Pre-Exposed to Nickel.
W91-00808 5C

Simple Continuous-Flow Toxicity Test System for Microscopic Life Stages of Aquatic Organisms.
W91-00814 5A

Toxicity of 1,1,1-Trichloroethane and Trichloroethene on a Mixed Culture of Methane-Oxidizing Bacteria.
W91-00832 5G

Tetrachloroethene Transformation to Trichloroethene and cis-1,2-Dichloroethene by Sulfate-Reducing Enrichment Cultures.
W91-00833 5B

Tolerance of Scapania undulata (L.)Dum. to Fluoride.
W91-00835 5C

TOXICOLOGY
Comparative QSAR Study on Freshwater and Estuarine Toxicity.
W91-00195 5C

Ecotoxicology: Contamination of the Rhine by the Sandoz Chemical Accident in Basel (Oko-toxikologie am Beispiel der Rheinverschmutzung durch den Chemie-Unfall bei Sadoz in Basel).
W91-00384 5C

Fish Hepatocyte Model for Investigation of the Effects of Trihalomethanes.
W91-00503 7B

TRACE ELEMENTS
Cross-Sectional Variability in Suspended Sediment and Associated Trace Element Concentrations in Selected Rivers in the US.
W91-00287 2J

TRACE LEVELS
Acid Precursor Concentrations Above the Northeastern United States during Summer 1987: Three Case Studies.
W91-00148 5B

Simple Device for the Determination of Volatile Chlorinated Hydrocarbons in Water by Gas Chromatography.
W91-00727 5A

TRACE METALS
Automated Preconcentration of Trace Metals from Seawater and Freshwater.
W91-00615 7B

Trace Metal Wet Deposition in Sweden: Insight Gained from Daily Wet Only Collection.
W91-00853 5B

Further Discussion on the Intercomparison of the Trace Metal Concentrations and Particle Size of Fluvial Sediment Recovered from Two Centrifuge Systems.
W91-00866 5A

TRACERS
Application of Radioactive Tracer Techniques for Determining Groundwater Velocity and Direction.
W91-00223 7B

Environmental Isotope-Aided Studies on Water Resources in the Region of Cheju Island.
W91-00224 2F

Groundwater Recharge Estimation by Tritium Tracer Technique in Sathupally Area, Andhra Pradesh, India.
W91-00225 2F

Environmental Chloride Method for Groundwater Recharge Studies: Potentialities and Limitations.
W91-00226 2F

Specific Yield Estimations by Radio-Active Tracer in Indo-Gangetic Plain.
W91-00227 2F

Management and Conservation of Ground Water Resource Through Point Dilution Technique Using Radiotracer - Some Case Histories.
W91-00229 4B

Use of Single Well Dilution Technique for Seepage Measurements from Canals Using Radio-Active Tracer.
W91-00230 2F

Computer Simulation of an Injected Tracer Movement.
W91-00262 2F

Sediment Storage and Movement on the Southern High Plains of Texas as Indicated by Beryllium-Ten.
W91-00299 2J

Comparison of Tracer-Dilution and Current-Meter Discharge Measurements in a Small Gravel-Bed Stream, Little Lost Man Creek, California.
W91-00337 2E

Proposal to Use Chlorine-36 for Monitoring the Movement of Radionuclides from Nuclear Explosions.
W91-00366 5A

Preliminary Assessment of the Potential for Using Cesium-137 to Estimate Rates of Soil Erosion in the Loess Plateau of China.
W91-00405 2J

Mathematical Modeling of Tracer Behavior in Short-Term Experiments in Fissured Rocks.
W91-00598 5B

Fluorescent Polycyclic Aromatic Hydrocarbons as Probes for Studying the Impact of Colloids on Pollutant Transport in Groundwater.
W91-00623 5B

Po210 and Pb210 Remobilization from Lake Sediments in Relation to Iron and Manganese Cycling.
W91-00624 5B

Chemical Studies of Chloride and Stable Oxygen Isotopes in Two Conifer Afforested and Moorland Sites in the British Uplands.
W91-00890 2D

Using Rn222 to Examine Groundwater/Surface Discharge Interaction in the Rio Grande de Manati, Puerto Rico.
W91-00893 2F

TRANSMISSIVITY
Computation of Transmissivity from Step-Drawdown Tests.
W91-00220 2F

TRANSPIRATION
First ISLSCP Field Experiment: Experiment Execution and Preliminary Analyses.
W91-00460 7B

Transpiration of Plantation Pinus radiata Estimated by the Heat Pulse Method and the Bowen Ratio.
W91-00867 2D

Evaluation and Prediction of Possible Man-Induced Changes in the Hydrological Cycle.
W91-00967 4C

TREES
Effect of Drought on Urban Water Supplies. I: Drought Analysis.
W91-00059 6D

TRIHALOMETHANES
South Australian Water: A Disinfection Problem.
W91-00480 5F

Chlorinated Hydrocarbons and Water Quality Issues in the New York City Municipal Water Supply.
W91-00481 5F

Trihalomethanes: Is Swimming Pool Water Hazardous.
W91-00484 5F

Fish Hepatocyte Model for Investigation of the Effects of Trihalomethanes.
W91-00503 7B

Case-Control Study of Multiple Cancer Sites and Water Chlorination in Iowa.
W91-00507 5C

By-Products of Chlorination at Ten Operating Utilities.
W91-00521 5B

Organic Halide Formation During Water Treatment Under Free Chlorine Versus Chloramination Conditions.
W91-00522 5B

Effect of Preozonation on Trihalomethane and Total Organic Halogen Formation at the Louisville Water Company.
W91-00523 5F

Trihalomethane Formation Potential and Organic Content: A New Analytical Approach.
W91-00524 5F

Chloroform Formation by the Transfer of Active Chlorine from Monochloramine to Phloroacetophenone.
W91-00525 5B

Trihalomethane Formation and Distribution in Bromide-Rich and Ammonia-Containing Lake Water.
W91-00526 5B

Effects of Copper (II) on the Production of Trihalomethanes in Model and Natural Waters.
W91-00529 5B

TRITIUM
Groundwater Recharge Estimation by Tritium Tracer Technique in Sathupally Area, Andhra Pradesh, India.
W91-00225 2F

Environmental Isotope-Aided Study on River Water and Groundwater Interaction in the Region of Seoul and Taegu.
W91-00257 2A

Tritium Concentrations in Flow from Selected Springs that Discharge to the Snake River, Twin Falls-Hagerman Area, Idaho.
W91-00336 5B

TROPHIC LEVEL
Growth Responses of Planktonic Desmid Species in a Temperature-Light Gradient.
W91-00424 2H

Seasonal Changes of the Environmental Conditions in Dimictic Lakes Differing as to Their Trophic State (Sezonowe Zmiany Warunkow Srodowiska w Jeziorach Dymiktycznych o Roznym Stopniu Eutrofizacji).
W91-00735 2H

TROPICAL REGIONS
Satellite Teletransmission: Technology Applied to Hydrological Forecasting. An Example of the Fight against Onchocercosis (La Teletransmission par Satellite: Une Technologie Adaptee a la Prevision Hydrologique. Exemple de la Lutte contre l'Onchocerose).
W91-00475 7B

Ecology of Cyclopoid Copepods (Copepoda: Crustacea) in a Tropical Backwater Pond.
W91-00682 2H

Biomonitoring of Chemicals on Tropical Ecosystems.
W91-00823 5B

TROUT
Populations, Growth, Biomass and Production of Fish in a Small Stream in North-West Poland.
W91-00007 2H

Evaluation of Trout Passage Through Six Highway Culverts in Montana.
W91-00012 8I

Stream Canopy and Its Relationship to Salmonid Biomass in the Intermountain West.
W91-00013 8I

Testing of Habitat Assessment Models for Small Trout Streams in the Medicine Bow National Forest, Wyoming.
W91-00014 8I

Reintroduction of Salmon and Sea Trout into the Vantaanjoki and Kymijoki Rivers (Lohen ja Meritaimenen Palautttaminen Vantaanjokeen ja Kymijokeen).
W91-00017 8I

TROUT

Ambient Ammonia, Diet and Growth in Lake Trout.
W91-00200 5C

Effect of Humic Substances on the Toxicity of Aluminum to Adult Rainbow Trout, Oncorhynchus mykiss (Walbaum).
W91-00371 5C

Plasma Electrolytes, Gill Aluminum Content, and Gill Morphology of Juvenile Atlantic Salmon (Salmo salar) and Brook Trout (Salvelinus fontinalis) Indigenous to Acidic Streams of Nova Scotia.
W91-00616 5C

TRYPTOPHAN
Mutagenicity of the Nonvolatile Reaction Products of Aqueous Chlorination of L-Tryptophan.
W91-00491 5C

TURBIDITY CURRENTS
Weakly Depositing Turbidity Current on a Small Slope.
W91-00096 2J

TURBINES
Analysis of Scale Effects on Performance Characteristics of Hydraulic Turbines: Part 2: Effects of Surface Roughness, Runner Seal Clearance and Reynolds Number on Performance and Loss Distribution Coefficients.
W91-00098 8G

TURBULENCE
Turbulence Measurements in a Shear Layer Region of a Compound Channel.
W91-00039 8B

TURBULENT FLOW
Turbulence Measurements in a Shear Layer Region of a Compound Channel.
W91-00039 8B

TURKEY
Radioactivity Level of Black Sea Marine Algae Before and After the Chernobyl Accident.
W91-00796 5B

TWENTYMILE CREEK
Channel and Bank Stability of Twentymile Creek at U.S. Highway 45 Near Wheeler, Prentiss County, Mississippi.
W91-00439 2J

ULTRAVIOLET RADIATION
Basic Guidelines for Specifying the Design of Ultraviolet Disinfection Systems.
W91-00401 5D

Use of UV Radiation for Disinfecting Water in First Stage Growth Tanks Stocked with Rainbow Trout Larvae (Zastosowanie Promieniowania Uv Do Dezynfekcji Wody W Podchowalni Wylegu Pstraga).
W91-00786 8I

UNCONFINED AQUIFERS
Capillarity Correction for Free Surface Flow Revisited.
W91-00614 4B

UNDERGROUND STORAGE
High Water Level Installation of Monitoring Wells for Underground Storage Tanks.
W91-00364 5G

Underground Storage Tanks.
W91-00904 5G

UNDERGROUND STORAGE TANKS
Fate and Transport of Petroleum Released from Underground Storage Tanks.
W91-00452 5B

UNDERGROUND WASTE DISPOSAL
Implications of Environmental Program Planning for Siting a Nuclear Waste Repository at Yucca Mountain, Nevada, USA.
W91-00026 5E

Geologic and Hydrologic Issues Related to Siting a Repository for High-level Nuclear Waste at Yucca Mountain, Nevada, U.S.A.
W91-00030 5E

Geohydrologic Aspects for Siting and Design of Low-Level Radioactive-Waste Disposal.
W91-00347 5E

Contaminant Dissolution and Diffusional Transport with a Stationary Precipitation Front.
W91-00612 5E

Disposal in Mines and Salt Domes.
W91-00953 5E

UNGAGED CATCHMENTS
Errors in Estimated Streamflow Parameters and Storages for Ungauged Catchments.
W91-00085 2E

UNIFORM FLOW
Improved Method of Calculation for Steady Uniform Flow in Prismatic Main Channel/Flood Plain Sections.
W91-00038 8B

UNSATURATED FLOW
Modeling Infiltration in Hysteretic Soils.
W91-00118 2G

Theory of Subsurface Water-Borne Solute Transport.
W91-00119 5B

Estimation of Recharge and Pollutant Transfer to Groundwater by Modelling of Unsaturated Zone.
W91-00259 2F

General Mass-Conservative Numerical Solution for the Unsaturated Flow Equation.
W91-00595 2G

Modeling the Movement of Volatile Organic Chemicals in Columns of Unsaturated Soil.
W91-00599 5B

UNSTEADY FLOW
Algorithm for Routing Unsteady Flows in Urban Drainage Networks.
W91-00031 4C

Depth-Integrated Model for Suspended Sediment Transport.
W91-00033 2J

Model of Flow in Regulated Open-channel Networks.
W91-00172 2E

2-D Bed Evolution in Natural Watercourses: New Simulation Approach.
W91-00177 2J

UPCONING
Theory and Application of an Approximate Model of Saltwater Upconing in Aquifers.
W91-00883 2F

UPGRADING
Upgrading the Owl's Head Wastewater Treatment Plant.
W91-00107 5D

UPWELLING
Influence of Upwellings, Storms, and Generating Station Operation on Water Chemistry and Plankton in the Nanticoke Region of Long Point Bay, Lake Erie.
W91-00662 2H

Microphytoplankton of Upwelling Coastal Waters (State of Rio de Janeiro): List of Species and Ecological Aspects (O Microfitoplancton das Aguas Costeiras do Litoral Fluminense (Estado do Rio de Janeiro)): Lista de Especies e Aspectos Ecologicos.

Spatial and Temporal Variation in Fishes of Riffle Habitats: A Comparison of Analytical Approaches for the Roanoke River.
W91-00868 8I

VIRUSES
Acute Toxicity, Sublethal Effects, and Bioconcentration of Chlorination Products, Viruses, and Bacteria in Edible Shellfish: A Review.
W91-00515 5C

Inactivation of Enteric Viruses in Chlorinated Wastewater Sprayed on Vegetables.
W91-00548 5D

Emerging Issues for the Microbiology of Drinking Water.
W91-00627 5F

Sequential Inoculation as an Adjunct in Enteric Virus Plaque Enumeration.
W91-00815 5A

VISTULA RIVER
Development and Structure of the Goczalkowice Reservoir Ecosystem: XX. Long-Term Changes in the Abundance and Composition of Microbial Communities.
W91-00006 2H

VOLATILE ORGANIC COMPOUNDS
Performance Evaluation Materials for the Analysis of Volatile Organic Contaminants in Soil: A Preliminary Assessment.
W91-00393 5A

Superfund Record of Decision: Velsicol Chemical Corporation, IL.
W91-00445 5G

Correlations Between Measurements of Organic Halide and Specific Halogenated Volatile Organic Compounds in Contaminated Groundwater.
W91-00528 5B

Modeling the Movement of Volatile Organic Chemicals in Columns of Unsaturated Soil.
W91-00599 5B

VOLCANOES
Wet Deposition of Volcanic Gases and Ash in the Vicinity of Mount Sakurajima.
W91-00669 5B

VORTICES
Concentration of Very Fine Silts in a Steady Vortex.
W91-00035 2J

Vortex Drop Inlet for Supercritical Approaching Flow.
W91-00153 8A

WALES
Spatial Organisation of Daily Rainfall in Wales During Autumn-Winter.
W91-00115 2B

Topographic Effects on Flow Path and Surface Water Chemistry of the Llyn Brianne Catchments in Wales.
W91-00888 2E

WALLEYES
Seasonal Habitat Use by Walleye in a Warmwater River System, as Determined by Radiotelemetry.
W91-00009 8I

Predicting Success of Walleye Stocking Programs in the United States and Canada.
W91-00691 8I

WARANGAL
Role of Hydrogeological Set Up in the Yield of Wells in Granite Terrain: Case Histories of Nizamabad, Warangal and Hindupur Areas.
W91-00253 2F

WARFARIN
Determination of Warfarin in Drinking Water by High-Performance Liquid Chromatography after Solid-Phase Extraction.
W91-00723 5A

WASHINGTON
Potential for Agricultural Pesticide Runoff to a Puget Sound Estuary: Padilla Bay, Washington.

WATER ANALYSIS

Methods and Preliminary Results of Geochemical Sampling, San Juan Basin, New Mexico, Colorado, Arizona, and Utah.
W91-00317 2F

Selected Quality Assurance Data for Water Samples Collected by the U.S. Geological Survey, Idaho National Engineering Laboratory, Idaho, 1980 to 1988.
W91-00334 7B

Evaluation of Methods Used from 1965 Through 1982 to Determine Inorganic Constituents in Water Samples.
W91-00350 7B

Suggested Methods for Calculating and Interpreting Calcium Carbonate Saturation Indexes.
W91-00380 2K

Measurement of Biodegradable Organic Matter and Bacterial Growth Potential in Drinking Water.
W91-00381 5F

Determination of Gold at Femtomolar Levels in Natural Waters by Flow Injection Inductively Coupled Plasma Quadrupole Mass Spectrometry.
W91-00388 2K

Determination of Chloroaniline Traces in Environmental Waters by Selective Extraction with Two Traps in Tandem and Liquid Chromatography.
W91-00389 5A

Automated High-Performance Liquid Chromatography for the Determination of Pesticides in Water Using Solid Phase Extraction.
W91-00390 5A

Current Status of Disinfectant Residual Measurement Methods for Free and Combined Chloride and Oxychlorine Species.
W91-00479 5A

Evaluation of Protocol for Preparing Drinking Water Samples for Ames Mutagenicity Testing.
W91-00496 5A

Chloramine Interference in the Measurement of Free Chlorine by the Amperometric Membrane Electrode.
W91-00537 7B

Chemistry of Bromine Transfer: Disproportionation and Hydrolysis in Bromamine Systems.
W91-00540 2K

Automated Preconcentration of Trace Metals from Seawater and Freshwater.
W91-00615 7B

Automated Determination of Silica in Surface and Ground Water (Die Outomatiese Bepaling van Silika in Oppervlak en Grondwater).
W91-00638 7B

Synchronous Fluorescence Spectroscopy of Dissolved Organic Matter in Surface Waters: Application to Airborne Remote Sensing.
W91-00639 5A

Determination of Warfarin in Drinking Water by High-Performance Liquid Chromatography after Solid-Phase Extraction.
W91-00723 5A

Determination of Fungistatic Quaternary Ammonium Compounds in Beverages and Water Samples by High-Performance Liquid Chromatography.
W91-00724 5A

Determination of Borate at Trace Levels in Environmental Samples by Ion-Exclusion Chromatography.
W91-00725 5A

Simple Device for the Determination of Volatile Chlorinated Hydrocarbons in Water by Gas Chromatography.
W91-00727 5A

Microbial Sensor for BOD.
W91-00812 5A

Isolation of Dissolved Organic Matter from the Suwannee River Using Reverse Osmosis.
W91-00816 5B

Use of Membrane Extraction Disks for On-Line Trace Enrichment of Organic Compounds from Aqueous Samples.
W91-00839 5A

Method to Extract Soil Water for Stable Isotope Analysis.
W91-00898 2G

WATER AUCTIONS

Water Auctions as an Allocation Mechanism in Victoria, Australia.
W91-00080 6C

WATER BEETLES

Bioaccumulation of Mercury and Its Effect on Protein Metabolism of the Water Hyacinth Weevil Neochetina eichhornae (Warner).

W91-00373 8B

UNIVERSIDAD NACIONAL DE LA PLATA (ARGENTINA). INST. DE LIMNOLOGIA.
Chemical Characteristics of the Water of Chascomus Pond (Provincia de Buenos Aires, Argentina): Limnological Implications (Caracteristicas Quimicas das Aguas da Lagoa de Chascomus (Provincia de Buenos Aires, Argentina). Implicancias Limnologicas).
W91-00781 2H

UNIVERSIDAD NACIONAL DE LUJAN (ARGENTINA). LAB. OF ECOTOXICOLOGY.
Effects of Deltamethrin and Ethanol on Survival, and Mechanical Response of Daphnia spinulata.
W91-00208 5C

UNIVERSIDADE ESTADUAL PAULISTA, SAO JOSE DO RIO PRETO (BRAZIL). INST. DE BIOCIENCIAS.
Seasonal Variation of Sirodotia delicatula Skuja (Rhodophyta, Batrachospermaceae) in a Small Stream From Sao Paulo State, Southeastern Brazil.
W91-00782 2H

UNIVERSIDADE FEDERAL DE SAO CARLOS (BRAZIL). LAB. OF LIMNOLOGY.
Predation on and by Pelagic Turbellaria in Some Lakes in Brazil.
W91-00695 2H

UNIVERSITAET DES SAARLANDES, SAARBRUECKEN (GERMANY, F.R.). INST. FUER BIOGEOGRAPHIE.
Biomonitoring of Chemicals on Tropical Ecosystems.
W91-00823 5B

UNIVERSITY COLL., GALWAY (IRELAND). DEPT. OF ENGINEERING HYDROLOGY.
Hydrology Past and Present.
W91-00066 2A

UNIVERSITY OF CENTRAL FLORIDA, ORLANDO. DEPT. OF CIVIL ENGINEERING AND ENVIRONMENTAL SCIENCES.
Cost and Performance of Membranes for Organic Control in Small Systems: Flagler Beach and Punta Gorda, Florida.
W91-00448 5F

SOC (Synthetic Organic Compounds) Rejection by Nanofiltration.
W91-00449 5F

UNIVERSITY OF NEW ENGLAND, ARMIDALE (AUSTRALIA). DEPT. OF RESOURCE ENGINEERING.
Occurrence of Hypolimnetic Blooms of the Purple Sulfur Bacterium, Thiopedia rosea, and the Green Sulfur Bacterium, Chlorobium limicola, in an Australian Reservoir.
W91-00652 5C

UNIVERSITY OF PETROLEUM AND MINERALS, DHAHRAN (SAUDI ARABIA). DEPT. OF EARTH SCIENCES.
Optimal Planning and Operation of Multiaquifer System.
W91-00179 4B

UNIVERSITY OF PUGET SOUND, TACOMA, WA. DEPT. OF BIOLOGY.
Spectral Irradiance and Distribution of Pigments in a Highly Layered Marine Microbial Mat.
W91-00826 2L

UNIVERSITY OF SCIENCE, PENANG (MALAYSIA).
More Accurate Determination of Aquifer Parameters Using the IP Sounding Method.
W91-00238 7B

UNIVERSITY OF SOUTH FLORIDA, TAMPA. DEPT. OF ENVIRONMENTAL AND OCCUPATIONAL HEALTH.
Emerging Issues for the Microbiology of Drinking Water.
W91-00627 5F

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.
Fate and Transport of Petroleum Released from Underground Storage Tanks.
W91-00452 5B

UNIVERSITY OF THE WEST INDIES, KINGSTON (JAMAICA). DEPT. OF ZOOLOGY.
Beach Tar Contamination in Jamaica.
W91-00702 5B

UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG (SOUTH AFRICA). DEPT. OF CIVIL ENGINEERING.
Prediction of Entrainment Conditions for Non-uniform, Noncohesive Sediments.
W91-00094 2J

UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG (SOUTH AFRICA). WATER SYSTEMS RESEARCH PROGRAMME.
Modular Model for Simulating Continuous or Event Runoff.
W91-00970 2E

UPPSALA UNIV. (SWEDEN). DEPT. OF ECOLOGICAL BOTANY.
Divergent Successions in Mires, a Comparative Study.
W91-00646 2H

UTILITY ENGINEERING CORP., RAPID CITY, SD.
Sylvan Lake Restoration Project.
W91-00562 5G

UTRECHT RIJKSUNIVERSITEIT (NETHERLANDS). DEPT. OF GEOGRAPHY.
Metal Dispersal in the Fluvial System of the River Geul: The Role of Discharge, Distance to the Source, and Floodplain Geometry.
W91-00286 5B

Soil Erosion and Floodplain Soil Pollution: Related Problems in the Geographical Context of a River Basin.
W91-00289 5B

UTTAR PRADESH IRRIGATION RESEARCH INST. ROORKEE (INDIA).
Specific Yield Estimations by Radio-Active Tracer in Indo-Gangetic Plain.
W91-00227 2F

Use of Single Well Dilution Technique for Seepage Measurements from Canals Using Radio-Active Tracer.
W91-00230 2F

V.O.C. COLL., TUTICORIN (INDIA). DEPT. OF GEOLOGY.
Hydrogeophysical Studies for Characterizing the Crystalline Aquifers of Tambraparni Basin, Tamil Nadu, India.
W91-00242 2F

Techniques of Aquifer Parameter Evaluation Using Pocket Computers.
W91-00265 2F

VALENCIA UNIV. (SPAIN). FACULTY OF PHYSICS.
Iron-Binding Compounds and Related Outer Membrane Proteins in Vibrio cholerae Non-O1 Strains from Aquatic Environments.
W91-00830 5B

VALTION TEKNILLINEN TUTKIMUSKESKUS, ESPOO (FINLAND).
Determination of Snow Water Equivalents by Using NOAA-Satellite Images, Gamma Ray Spectrometry and Field Measurements.
W91-00470 2C

VALTION TEKNILLINEN TUTKIMUSKESKUS, ESPOO (FINLAND). ELINTARVIKELABORATORIO.
Determination of Fungistatic Quaternary Ammonium Compounds in Beverages and Water Samples by High-Performance Liquid Chromatography.
W91-00724 5A

VANDERBILT UNIV., NASHVILLE, TN.
Commercial Oxygen Use in Water-Quality Management.
W91-00770 5D

VERSAR, INC., COLUMBIA, MD.
Enhancement of Benthic Macroinvertebrates by Minimum Flow from a Hydroelectric Dam.
W91-00778 6G

VIENNA UNIV. (AUSTRIA). LIMNOLOGISCHE LEHRKANZEL.
Comparative Study of Mathematical Models for the Relationship between Water Temperature and Brood Development Time of Gammarus fossarum and G. roeseli (Crustacea: Amphipoda).
W91-00420 2H

VIRGINIA INST. OF MARINE SCIENCE, GLOUCESTER POINT.
Induced Cytochrome P-450 in Intestine and Liver of Spot (Leiostomus xanthurus) from a Polycyclic Aromatic Hydrocarbon Contaminated Environment.
W91-00198 5C

Field Evaluation of the Effect of Chlorinated Treated Sewage on Settlement of Oysters (Crassostrea virginica Gmelin) and Barnacles (Balanus sp).
W91-00511 5C

Water Chlorination: Is There Environmental Risk.
W91-00550 5F

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. CENTER FOR ENVIRONMENTAL AND HAZARDOUS MATERIAL STUDIES.
Numerical Model for Areal Migration of Water and Light Hydrocarbon in Unconfined Aquifers.
W91-00120 5B

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DIV. OF ENGINEERING FUNDAMENTALS.
Three-Dimensional Scale Model of Ground-Water Solute Transport.
W91-00064 5B

VOLCANI INST. OF AGRICULTURAL RESEARCH, BET-DAGAN (ISRAEL).
Water Quality and PAM interactions in Reducing Surface Sealing.
W91-00791 4D

VRIJE UNIV., AMSTERDAM (NETHERLANDS). DEPT. OF ANALYTICAL CHEMISTRY.
Use of Membrane Extraction Disks for On-Line Trace Enrichment of Organic Compounds from Aqueous Samples.
W91-00839 5A

VRIJE UNIV., BRUSSELS (BELGIUM). DIENST ANALYTISCHE SCHEIKUNDE EN GEOCHEMIE.
Wet and Dry Deposition Fluxes Above the North Sea.
W91-00845 2B

VYZKUMNY USTAV VODOHOSPODARSKY, PRAGUE (CZECHOSLOVAKIA).
Simple Device for the Determination of Volatile Chlorinated Hydrocarbons in Water by Gas Chromatography.
W91-00727 5A

WARSAW UNIV. (POLAND). DEPT. OF HYDROBIOLOGY.
Cyclomorphosis in Daphnia: An Adaptation to Avoid Invertebrate Predation.
W91-00696 2H

WARSAW UNIV. (POLAND). LAB. OF MEDICAL PHYSICS.
Numerical Model of Phosphorus Exchange Between the Sediments and the Near-Bottom Water in a Lake.
W91-00002 2H

WASHINGTON UNIV., SEATTLE. APPLIED PHYSICS LAB.
Modeling the Effect of Algal Biomass on Multispecies Aquatic Microcosms Response to Copper Toxicity.
W91-00197 5C

WASHINGTON UNIV., SEATTLE. DEPT. OF CIVIL ENGINEERING.
Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 1. Models, Model Properties, and Experimental Design.
W91-00604 2A

Assessment of a Conceptual Rainfall-Runoff Model's Ability to Represent the Dynamics of Small Hypothetical Catchments: 2. Hydrologic Responses for Normal and Extreme Rainfall.
W91-00605 2A

WASTE-TECH SERVICES, INC., GOLDEN, CO.
Fluidized-Bed Thermal Oxidation.
W91-00932 5D

WATER AUTHORITY OF WESTERN AUSTRALIA, PERTH.
Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. I: Results from Hillslope Transect with Coarse-Textured Soil Profiles.
W91-00863 2G

Seasonal Soil Water Dynamics in the Jarrah Forest, Western Australia. II: Results from a Site with Fine-Textured Soil Profiles.
W91-00864 2G

Groundwater Response to Reforestation in the Darling Range of Western Australia.
W91-00892 2F

WATER MANAGEMENT OFFICE, CONSTANTA (ROMANIA).
Some Preliminary Data on the Nutrient Influx into the Western Black Sea.
W91-00712 5B

WATER RESEARCH CENTRE, MEDMENHAM (ENGLAND). MEDMENHAM LAB.
Production of Organic Chemicals and Mutagens during Chlorination of Amino Acids in Water.
W91-00485 5F

WATERLOO UNIV. (ONTARIO).
Estimation of Phosphorus from the Niagara River to Lake Ontario.
W91-00133 5E

WATERLOO UNIV. (ONTARIO). DEPT. OF HEALTH STUDIES.
Some Comments on Analysis Techniques for Censored Water Quality Data.
W91-00131 5G

WEIZMANN INST. OF SCIENCE, REHOVOTH (ISRAEL).
Heavy Metals in the Dead Sea and Their Coprecipitation with Halite.
W91-00738 2H

WEIZMANN INST. OF SCIENCE, REHOVOTH (ISRAEL). DEPT. OF ISOTOPE RESEARCH.
Nutrients in Pore Waters from Dead Sea Sediments.
W91-00742 2H

WESTAT RESEARCH, INC., ROCKVILLE, MD.
Quantities and Sources of Hazardous Wastes.
W91-00905 5E

WESTERN AUSTRALIA UNIV., NEDLANDS. AQUATIC RESEARCH LAB.
Classification of the Macroinvertebrate Fauna of Two River Systems in Southwestern Australia in Relation to Physical and Chemical Parameters.
W91-00774 2H

WESTERN WASHINGTON UNIV., BELLINGHAM. INST. FOR WATERSHED STUDIES.
Potential for Agricultural Pesticide Runoff to a Puget Sound Estuary: Padilla Bay, Washington.
W91-00204 5B

WESTON (ROY F.), INC., WASHINGTON, DC.
Summary of CERCLA Legislation and Regulations and the EPA Superfund Program.
W91-00903 6E

WESTON (ROY F.), INC., WEST CHESTER, PA.
Sampling and Monitoring of Remedial-Action Sites.
W91-00955 5A

WILEY AND WILSON, INC., LYNCHBURG, VA.
Development of a Water and Wastewater SCADA System.
W91-00101 5F

WILLING AND PARTNERS, CANBERRA (AUSTRALIA).
Temporal Lag Effect in Bed Load Sediment Transport.
W91-00093 2J

WISCONSIN DEPT. OF NATURAL RESOURCES, SPOONER. NORTHWEST DISTRICT.
Corrosion and Water Quality.
W91-00411 5B

WISCONSIN UNIV.-MADISON.
Case-Control Study of Colon Cancer and Volatile Organics in Wisconsin Municipal Groundwater Supplies.
W91-00506 5C

WISCONSIN UNIV.-MADISON. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Statistics-Based System for Treatment Plant Operation.
W91-00129 5D

WISCONSIN UNIV.-MADISON. DEPT. OF GEOGRAPHY.
Long and Short-term Episodic Storage and Removal of Sediment in Watersheds of Southwestern Wisconsin and Northwestern Illinois.
W91-00297 2J

WISCONSIN UNIV.-MADISON. DEPT. OF GEOLOGY AND GEOPHYSICS.
Specific Storage as a Poroelastic Coefficient.
W91-00607 2F

WISCONSIN UNIV.-MADISON. INST. FOR ENVIRONMENTAL STUDIES.
Response of the US EPA Region V States to the Nonpoint Source Reporting Requirements of the 1987 Clean Water Act Amendments.
W91-00565 5G

WISCONSIN UNIV.-MILWAUKEE. DEPT. OF CHEMISTRY.
Chlorine and Monochloramine Measurements Using a Pulsed Silver Iodide Electrode.
W91-00536 5A

WISCONSIN UNIV.-MILWAUKEE. DEPT. OF GEOSCIENCES.
Spatially Continuous Determination of Groundwater Flow to Surface Water Bodies: Application to the Connecting Channels Between Lakes Huron and Erie.
W91-00163 2A

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MA.
Detecting the Biological Effects of Deep-Sea Waste Disposal.
W91-00386 5A

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MA. COASTAL RESEARCH CENTER.
Potential Coastal Impacts of Contemporary Changing Climate on South Asian Seas States.
W91-00027 4C

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MA. DEPT. OF BIOLOGY.
Effects of Wastes on the Ocean: The Coastal Example.
W91-00385 5C

WOODWARD-CLYDE CONSULTANTS, SANTA ANA, CA.
Land Treatment of Hazardous Wastes.
W91-00945 5D

WORLD METEOROLOGICAL ORGANIZATION, GENEVA (SWITZERLAND).
Real-Time Intercomparison of Hydrological Models.
W91-00974 2A

WRC ENGINEERING, SWINDON (ENGLAND).

WRC ENGINEERING, SWINDON (ENGLAND).
Continuous Effluent Consents: Modelling and Compliance Testing.
W91-00126 5G

WRIGHT WATER ENGINEERS, INC., DENVER, CO.
Estimated Runoff from Man-Made Snow.
W91-00092 2C

WROCLAW UNIV. (POLAND). DEPT. OF ECOLOGY AND NATURE PROTECTION.
Tolerance of Scapania undulata (L.)Dum. to Fluoride.
W91-00835 5C

WYOMING COOPERATIVE FISHERY AND WILDLIFE RESEARCH UNIT, LARAMIE.
Testing of Habitat Assessment Models for Small Trout Streams in the Medicine Bow National Forest, Wyoming.
W91-00014 8I

WYOMING UNIV., LARAMIE. DEPT. OF PLANT SCIENCE.
Effects of Sediment and Flow Regime on the Aquatic Insects of a High Mountain Stream.
W91-00776 2H

WYOMING UNIV., LARAMIE. WATER RESOURCES RESEARCH INST.
Optimization of Freshwater Inflow to Estuaries.
W91-00187 2L

WYOMING VALLEY SANITARY AUTHORITY, WILKES-BARRE, PA.
Accuracy of Hydrant Flow Tests Using a Pitot Diffuser.
W91-00378 7B

WYOMING WATER RESEARCH CENTER, LARAMIE.
Evaluating the Probability of Violating Dissolved Oxygen Standard.
W91-00715 5G

XIAN LAB. OF LOESS AND QUATERNARY GEOLOGY (CHINA).
Preliminary Assessment of the Potential for Using Cesium-137 to Estimate Rates of Soil Erosion in the Loess Plateau of China.
W91-00405 2J

YORK UNIV., TORONTO (ONTARIO). DEPT. OF BIOLOGY.
Manipulating Lake Community Structure: Where Do We Go from Here.
W91-00428 2H

ZAMBIA UNIV., LUSAKA. SCHOOL OF MINES.
Absolute Dating of Sedimentation on Lake Torres with Spring Deposits, South Australia.
W91-00760 2H

ZIMPRO, INC., ROTHSCHILD, WI.
Wet Oxidation.
W91-00934 5D

ZURICH UNIV. (SWITZERLAND). REMOTE SENSING LABS.
Hydrological Remote Sensing Research with Large-Scale Applications in Western Europe.
W91-00455 7B

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 24, NUMBER 2
FEBRUARY 1991

W91-01005 -- W91-02043
CODEN: SWRABW

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Geological Survey, U.S. Department of the Interior, and published monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Water Resources Division, U.S. Geological Survey, MS 425, Reston, VA 22092. The **SWRA JOURNAL** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $170.00, Journal and Annual Indexes, $200.00; Indexes only, $80.00. Other Addresses, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A monthly publication of the Geological Survey
U.S. Department of the Interior

VOLUME 24, NUMBER 2
FEBRUARY 1991

W91-01005 -- W91-02043

LIBRARY U. OF I. URBANA-CHAMPAIGN

The Secretary of the Interior has deterimined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Office of Management and Budget through September 1991.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a monthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Water Resources Scientific Information Center. The cumulative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE WATER RESOURCES SCIENTIFIC INFORMATION CENTER DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2B. Precipitation

PRECIPITATION NUTRIENT INPUTS IN SEMIARID ENVIRONMENTS.
Agricultural Research Service, Tucson, AZ. Aridland Watershed Management Research Unit.
W. E. Emmerich.
Journal of Environmental Quality JEVQAA, Vol. 19, No. 3, p 621-624, July/September 1990. 1 fig, 5 tab, 18 ref.

Descriptors: *Chemistry of precipitation, *Nutrient transport, *Nutrients, *Precipitation, *Semiarid lands, Air masses, Ammonium, Arizona, Nitrates, Nutrient concentrations, Phosphates, Potassium, Seasonal variation, Spatial variation, Storms.

Seasonal and spatial variations in precipitation nutrient inputs were suggested by differences in storm type and air mass origin into southeastern Arizona. Wet precipitation nitrate-N, ammonium-N, phosphate-P, and K inputs were collected at seven sites to determine seasonal and spatial variations in nutrient inputs. Total nutrient inputs and concentrations in summer precipitation were significantly greater than in winter precipitation. Higher total summer inputs and concentrations were attributed to storm type and air mass origin rather than to precipitation amount, as summer precipitation accounted for 56% of the precipitation and 79, 69, 66, and 73% of the nitrate-N, ammonium-N, phosphate-P, and K, respectively. Spatial variability in nutrient input was limited to specific nutrients, seasons, and sites and attributed to precipitation variability and localized sources. Generally, the air masses and storm types that produced seasonal differences in nutrient inputs and concentrations affected all sites uniformly. (Author's abstract)

MODIFIED KOEPPEN CLASSIFICATION APPLIED TO MODEL SIMULATIONS OF GLACIAL AND INTERGLACIAL CLIMATES.
Wisconsin Univ.-Madison. Center for Climatic Research.
P. J. Guetter, and J. E. Kutzbach.
Climatic Change CLCHDX, Vol. 16, No. 2, p 193-215, April 1990. 7 fig, 3 tab, 41 ref.

Descriptors: *Atmospheric circulation, *Classification, *Climates, *Climatic changes, *Climatology, *Glaciers, *Global warming, *Mathematical models, Koeppen classification, Solar radiation.

A series of experiments was done using an atmospheric general circulation model to simulate climates from full glacial time at 18 ka (thousands of years before the present) to the present at 3000 year intervals, and at 126 ka, the previous interglacial period. A modified Koeppen climate classification was developed to aid in the interpretation of the results of the circulation model experiments. The climate classification scheme permits the characterization of eleven distinct seasonal temperature and precipitation regimes. For the modern climate, the modified classification agrees well with a classification of natural vegetation zones, and provides an easily-assimilated depiction of climate changes resulting from the varying boundary conditions in the past. At 18 ka, the time of glacial maximum, 45% of the land surface had climate classifications different from the present. At 126 ka, a time when northern hemisphere summer radiation was much greater than at present owing to changes in the date of perihelion and tilt of the earth's axis, the corresponding difference was 32%. For all experiments, 3 to 18 ka and 126 ka, only 30% of the land surface showed no change in climate classification from the present. Core areas showing no change included the Amazon basin, the northern Sahara and Australia. (Author's abstract)

GLOBAL CLIMATE CHANGE: IMPLICATIONS FOR AIR TEMPERATURE AND WATER SUPPLY IN CANADA.
Canadian Climate Centre, Downsview (Ontario).
H. G. Hengeveld.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 176-182, March 1990. 3 fig, 1 tab, 33 ref.

Descriptors: *Air temperature, *Canada, *Climatic changes, *Climatology, *Global warming, *Water supply, Air pollution, Aquatic environment, Atmospheric chemistry, Data interpretation, Model studies, Precipitation, Research priorities, Runoff, Soil moisture.

Results of recent research on changes in atmospheric chemistry and responses of the climate system, with particular focus on those factors important to aquatic ecosystems, are summarized. Measurements of atmospheric concentrations of climatically important gases over the past 30 years indicate a rapid rise in values, largely attributable to human activities. Results of climate model experiments project a major global climate warming of 1.5-4.5 C during the next century, should the concentrations of these gases continue to increase as predicted. In addition to the direct effects of warming on regional air temperatures and the frequency and severity of extreme heat events, hemispheric wind patterns and hence rainfall distribution will be affected. As a result, soil moisture, runoff, and water supplies to catch basins will change. Such changes have important implications for the nature of future aquatic environments. These projected changes need to be addressed by integrated research, planning, and management. (Author's abstract)

POTENTIAL APPLICATION OF MODELS IN FORECASTING THE EFFECTS OF CLIMATE CHANGES ON FISHERIES.
Oak Ridge National Lab., TN. Environmental Sciences Div.
D. L. DeAngelis, and R. M. Cushman.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 224-239, March 1990. 5 fig, 2 tab, 38 ref. DOE Contract DE-AC05-84OR21400.

Descriptors: *Climatic changes, *Climatology, *Fisheries, *Global warming, *Model studies, Carbon dioxide, Forecasting, Greenhouse effect, Literature review, Mathematical models.

Increased concentrations of carbon dioxide and other 'greenhouse gases' in the atmosphere and the possible resulting climatic changes will affect marine and freshwater fisheries. Many of the links in the causal chains relating these environmental changes to possible changes in fish stocks may be amenable to prediction through mathematical modeling. The adequacy of existing types of mathematical models relating changes in atmospheric CO2 to changes in environmental conditions and ultimately to changes in fish stocks is reviewed in the context of an overall strategy for forecasting changes in fish stocks. The model types include ecosystem models, fish physiological process models, and fish population models. When integrated with the chain of linkages suggested by envirograms, these models can form a coherent strategy for prediction of future changes. This strategy includes: (1) identification, through modeling and other information, of the causal chains

LIBRARY U. OF L. URBANA-CHAMPAIGN

likely to be strongest for a variety of important fisheries; (2) a focus of efforts on improving the accuracy of models representing these chains by continuing to refine models through corroboration with appropriate data collected year by year, and an estimation of uncertainties and incorporation of these into models; and (3) by viewing modeling as a means to generate ranges of possible outcomes rather than definite predictions. (White-Reimer-PTT)
W91-01392

TEMPERATURE-OXYGEN HABITAT FOR FRESHWATER AND COASTAL STRIPED BASS IN A CHANGING CLIMATE.
Oak Ridge National Lab., TN. Environmental Sciences Div.
C. C. Coutant.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 240-253, March 1990. 7 fig, 55 ref. DOE Contract DE-AC05-84OR21400.

Descriptors: *Aquatic habitats, *Climatic changes, *Climatology, *Global warming, *Physicochemical properties, *Striped bass, Chesapeake Bay, Coastal areas, Dissolved oxygen, Florida, Gulf of Mexico, Gulf of St Lawrence, Model studies, Temperature effects.

Habitat space for a fish species is normally constrained by extreme temperatures and low dissolved oxygen concentrations that the fish avoid. Both latitudinal limits to a species' geographic distribution and availability of suitable habitat on the local level may be altered by climate change. During the next century, average temperatures are expected to rise globally, and rainfall is expected to decrease in mid latitudes and increase in high latitudes. Some possible effects of climate change on distribution of anadromous and landlocked stocks of striped bass Morone saxatilis are predicted. The tenuous existence of striped bass along the northern coast of the Gulf of Mexico and in Florida will likely be jeopardized by regional warming and reduced streamflow. In many freshwater lakes, reservoirs, and estuaries, the existing summer constriction of suitable habitat by high temperatures and low oxygen concentrations may be aggravated by warming, altered streamflow, and increased hypoxia. A major loss of habitat is predicted to occur in the Chesapeake Bay, where the species has had its greatest abundance historically. An expansion of the species' range around Nova Scotia and farther into the Gulf of St. Lawrence may occur, although the cold Labrador Current may increase in volume and cancel any potential water temperature increases in the northernmost range of the species. The understanding of the habitat requirements of many commercially and recreationally important fish species exceeds the confidence in climate models, but will allow forecasts of changes in regional and local habitat suitability as the understanding of climate and the ability to forecast it improve. (Author's abstract)
W91-01393

POTENTIAL CHANGES IN THE THERMAL HABITAT OF GREAT LAKES FISH AFTER GLOBAL CLIMATE WARMING.
Wisconsin Univ.-Madison. Center for Limnology.
J. J. Magnuson, J. D. Meisner, and D. K. Hill.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 254-264, March 1990. 3 fig, 2 tab, 38 ref. National Sea Grant College Program and state of Washington federal grant NA800-AA-D-0086, project R/GB-28.

Descriptors: *Aquatic habitats, *Climatic changes, *Climatology, *Fisheries, *Global warming, *Great Lakes, *Limnology, *Temperature effects, Anoxic conditions, Black bass, Fish populations, Lake Erie, Lake Michigan, Model studies, Perch, Pikeperch, Salmon, Thermal stratification, Trout, Whitefish.

The potential changes in the size of thermal habitat of representative cold-, cool-, and warmwater fish were estimated for southern Lake Michigan and the central basin of Lake Erie before and after simulated global warming. Observed midlake thermal structures were modeled (BASE) and then manipulated with three general circulation climate models (OSU, GISS, GFDL) that projected warmer climates when atmospheric carbon dioxide concentrations were doubled. Under BASE conditions, on an annual basis, lake trout Salvelinus namaycush had the largest thermal habitat in southern Lake Michigan, coho salmon Oncorhynchus kisutch and yellow perch Perca flavescens had smaller thermal habitats, and largemouth bass Micropterus salmoides had none. Even for lake trout, the suitable thermal habitat was only 5-20% of the upper 200 m through the year. With rare exceptions, thermal habitat increased for species in all thermal guilds for all climate-warming scenarios. No thermal habitat was estimated for cold-water fish in the central basin of Lake Erie because the hypolimnion becomes anoxic in summer. The median increase in thermal habitat was 2.5 x BASE condition both for southern Lake Michigan and the central basin of Lake Erie. After climate warming, minimum thermal habitat during summer decreased for walleye Stizostedion vetreum, increased for yellow perch, and remained the same for lake whitefish Coregonus clupeaformis and lake trout. Fish yields estimated from published empirical models that relate thermal habitat in summer to maximum sustained yields remained about the same for lake trout and lake whitefish but increased for walleye. It was concluded that the sizes of the habitat favorable for cold-, cool-, and warmwater fish would increase in Lake Michigan, whereas the habitats favorable only for cool-, and warm water fish would increase in Lake Erie. (Author's abstract)
W91-01394

POTENTIAL EFFECTS OF GLOBAL CLIMATE WARMING ON THE GROWTH AND PREY CONSUMPTION OF GREAT LAKES FISH.
Wisconsin Univ.-Madison. Center for Limnology.

Fish bioenergetics models were used to assess the effect of global climate warming on the growth and prey consumption of warm-, cool-, and cold-water fishes at three sites spanning the range of thermal environments in the Great Lakes. Historical air and water temperature data and projected air temperature changes from three global climate models were used as input to regression models, which generated projections of water temperature changes before and after climate warming that would result from a doubling in atmospheric CO2 concentration. The bioenergetics simulations indicated that annual growth by yearling fish would increase with climate warming if prey consumption increased, but would decrease if prey consumption was constant. Changes in growth would be most pronounced in spring and autumn owing to a lengthening of the period during which fishes may behaviorally thermoregulate to find their optimal temperature for growth. Fish unable to thermoregulate (e.g. due to hypolimnetic oxygen depletion) would undergo decreased growth or weight loss in summer in warmer areas of the Great Lakes, where near-surface water temperatures would increase above the fishes' optimum. It was concluded that the food web dynamics and the potential for thermoregulation will greatly influence the direction and magnitude of changes in fish growth as the climate warms. Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 292-300, March 1990. 2 fig, 2 tab, 49 ref. Natural Sciences and Engineering Research Council of Canada Operating Grant OGP0003918.

Descriptors: *Bioindicators, *Climatic changes, *Climatology, *Global warming, *Great Lakes Basin, *Lamprey, *Limnology, Conductivity, Egg incubation, Forecasting, Growth, Model studies, Regression analysis, Temperature effects.

Forecasts based on initial assessments of climate change and its consequences for aquatic ecosystems are unlikely to be taken seriously unless some evidence becomes available that the forecasted effects are occurring. Many population rate processes should respond early to temperature and these responses may be used to detect some of the ecological effects of climate warming early in the process of change. In the Great Lakes basin, larval sea lampreys Petromyzon marinus and other stream fish may be such indicators. The hypothesis that temperature exerts a significant influence on two rate processes of sea lamprey, egg hatching and larval growth rate were tested by regression analysis using the Arrhenius model. The length of egg incubation was significantly related to the proportion of eggs hatching and to temperature ($P < 0.01$); temperature accounted for 88% of the total variability in hatching time. Both temperature and conductivity (as surrogate measure of stream productivity) were significant ($P < 0.01$) univariate predictors of growth rate in larval sea lamprey populations subjected to repeated lampricide treatments. However, temperature was the better predictor of growth ($r\ sq = 0.56$) and the conductivity variable did not contribute significantly ($P > 0.15$) in a stepwise multiple regression. Forecasts can be based on these temperature relationships which can be tested if and when climate change occurs. (Author's abstract)

B. J. Shuter, and J. R. Post.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 314-336, March 1990. 15 fig, 5 tab, 72 ref, append.

Descriptors: *Climatic changes, *Climatic effects, *Climatology, *Fish populations, *Population dynamics, *Zoogeography, Age classes, Black bass, Distribution, Fish behavior, Global warming, Perch, Seasonal variation, Starvation, Thermal effects.

The feeding activity of warmwater and coolwater fishes can be severely restricted during the long period of cold temperatures characteristic of

winter in temperate zone lakes and rivers. The effect of such restriction is greater for smaller fish. Weight-specific basal metabolism increases as size decreases; however, there is no corresponding increase in energy storage capacity. Thus, smaller fish tend to be less tolerant of starvation conditions because they exhaust their energy stores sooner. Such size dependence of starvation endurance has often been observed in laboratory experiments. In wild populations commonly subject to winter starvation, population viability hinges on the ability of young-of-the-year to complete a minimum amount of growth during their first year of life. From south to north, this ability is increasingly restricted as the growing season shortens and the starvation period lengthens. It is shown that this constraint is sufficient to explain the present locations of the northern distributional limit for yellow perch Perca flavescens in central and western North America, the northern distributional limit for Eurasian perch P. fluviatilis in Eurasia, and the northern distributional limit for smallmouth bass Micropterus dolomieui in central North America. Shifts in North American climate may relax this constraint and permit both yellow perch and smallmouth bass to thrive well to the north of their present distributions. (Author's abstract)

Many mathematical relationships have been used to summarize quantitative information about the effects of temperature on rate processes in ectothermic living systems. One of the more common relationships, which has been used for a century is termed the 'combined exponential model.' An exponential model, as with a first-order chemical reaction, is used to define a coefficient for a rate at a particular temperature; another exponential relationship (of the van't Hoff or the Arrhenius form) is then used to relate the coefficients of the rate process to their respective temperatures. The Arrhenius form has come to be preferred over the van't Hoff form. In ectotherm physiology, the combined exponential model applies when the relevant organism has not evolved means of compensating biologically for the underlying physicochemical dynamics as affected by temperature. The applicability of the combined model, of the Arrhenius form, to analogous ecological situations for aquatic ectothermic populations and ecosystems was assessed. On an empirical basis, it was found that this combined model has some utility in that it permits approximate assessments of some ecosystemic effects of climate warming. Aquatic ecosystems of temperate waters or that are dominated by ectothermic r-type species appear to possess relatively little self-organizing capability to compensate for climate warming. As with other living systems at lower 'levels of organization' that have not evolved internal ways to temper external temperature fluctuations, certain ecosystem processes may adapt to climate warming approximately as indicated by the combined exponential model. RELATIONSHIP BETWEEN CANADIAN PRAIRIE DRY AND WET MONTHS AND CIRCULATION ANOMALIES IN THE MID-TROPOSPHERE.
J. L. Knox, and R. G. Lawford.
Atmosphere - Ocean ATOCDA, Vol. 28, No. 2, p 189-215, June 1990. 11 fig, 5 tab, 24 ref. 2 append.

Descriptors: *Atmospheric circulation, *Canada, *Climatology, *Prairies, *Precipitation, Areal precipitation, Atmospheric physics, Atmospheric water, Climatic changes, Climatic zones, Data analysis, Model studies, Precipitation mapping, United States.

The dry and wet months for the Canadian prairies during the 40-year period 1946-1985 were identified and the relationship to the Northern Hemisphere circulation at the 50-kPa and 100-kPa levels is investigated. The target area is first subdivided into five zones on the basis of characteristic differences in precipitation climatology, and for each zone the dates of occurrence of dry and wet months are determined. These events are then stratified into five 'seasons'. Much of the analysis focuses on the two growing seasons: spring, defined as April and May, and early summer, June and July. Composite anomaly fields for the Northern Hemisphere are constructed for the 50-kPa level by 'season' and zone, and for the dry and wet groupings. For each zone, the two 50-kPa anomaly fields dry and wet are clearly distinguishable, not only over North America but in many instances, upstream and downstream of the continent. Composite anomalies are shown to be zone-sensitive. The 100-kPa and 50-kPa anomalous wind fields associated with the dry and wet regimes, respectively, are found to be consistent with dynamic and thermodynamic processes that control the production of precipitation. Anomaly field structures over the oceans and North America are related to Northern Hemisphere tropospheric circulation modes, including the Pacific-North Atlantic pattern, and the North Pacific and North Atlantic oscillations. High-latitude blocking over the North Atlantic and North Pacific is often associated with wet months, particularly in spring, whereas 'in situ' blocking over western Canada or simply amplified ridging extending northward from the western United States is almost invariably associated with dry months. RADAR OBSERVATIONS OF PRECIPITATION PRODUCTION IN THUNDERSTORMS.
McGill Univ., Montreal (Quebec). Dept. of Meteorology.
G. W. Reuter.
Atmosphere - Ocean ATOCDA, Vol. 28, No. 2, p 216-229, June 1990. 6 fig, 4 tab, 24 ref.

Descriptors: *Meteorology, *Precipitation, *Radar, *Rainstorms, *Thunderstorms, Atmospheric physics, Atmospheric water, Local precipitation, Mathematical analysis, Mathematical equations, Rainfall intensity, Rainfall rate, South Africa.

Little is known about the magnitudes and temporal behavior of integrated storm parameters for thunderstorms in regions outside North America. Precipitation production was investigated for 9 intense thunderstorms that developed over the Lowveld in South Africa. A C-band radar was used to observe the 3-dimensional reflectivity pattern of the storms. Using an empirical relation between reflectivity factor and precipitation content and integrating over the storm volume provides an estimate of the total precipitation content aloft. Likewise, an area integration of the instantaneous rain rate at cloud base yields an estimate of the rate of total outflow. At their maturing stage, the storms had precipitation contents of 0.2 to 5.0 Tg and rainfall rates of about 0.3 to 2.0 Gg/s. The total accumulation of rain at the ground ranged from 1 to 10 Tg. The characteristic storm updraft, defined as the ratio of the area-averaged rainfall rate to the volume-averaged precipitation content, was about 5 m/x for all storms. The time evolution of integral storm parameters is also presented and related to the overall storm development. The precipitation production values observed in the Lowveld storms compares well with previous estimates reported for large thunderstorms observed in Alberta and New England. (Author's abstract)

The effects of the relationship between cirrus cloud ice water content and cloud temperature on climate change are examined. A simple mechanistic climate model is used to study the feedback between ice water content and temperature. The central question studied concerns the extent to which both the radiative and microphysical properties of cirrus cloud influence such a feedback. To address this question, a parameterization of the albedo and emissivity of clouds is introduced. Observations that relate the ice water content to cloud temperature are incorporated in the parameterization to introduce a temperature dependence to both albedo and emittance. The cloud properties relevant to the cloud feedback are expressed as functions of particles size re, asymmetry parameter g and cloud temperature and analyses of aircraft measurements, lidar and ground based radiometer data are used to select re and g. Scattering calculations assuming spherical particles with a distribution described by re = 16 microns reasonably matched the lidar and radiometer data. However, comparison of cloud radiation properties measured from aircraft to those parameterized in this study required values of g significantly smaller than those derived for spheres but consistent with our understanding of nonspherical particle scattering. The climate simulations revealed that the influence of cirrus cloud on climate was strongly affected by the choice or re and g: parameters that are both poorly known for cirrus. The effect of ice water feedback on a CO2 warming simulation could be either positive or negative depending on the value of re assumed. Based on these results, it was concluded that prediction of cirrus cloud feedback on climate is both premature and limited by our lack of understanding of the relationship between size and shape of ice crystals and the gross radiative properties of cirrus. Descriptors: *Marine climates, *Meteorology, *Pacific Ocean, *Rainfall distribution, *Statistical analysis, *Tropical regions, Analysis of variance, Convection, Correlation analysis, Data interpretation, Diurnal variation, Mathematical analysis, Meteorological data, Satellite technology, Tropic zone, Variability.

A statistical analysis of time series of area-averaged rainfall over the oceans has been conducted around the diurnal time scale. The results of this analysis can be applied directly to the problem of establishing the magnitude of expected errors to be incurred in the estimation of monthly area-averaged rain rates from low orbiting satellites. Such statistics as the mean, standard deviation, integral time scale of background red noise and spectral analyses were performed on time series of the GOES Precipitation Index (GPI) taken at 3-hour intervals during the period spanning December 19, 1987 to March 31, 1988 over the central and eastern tropical Pacific. The analyses have been conducted on 2.5 degree x 2.5 degree and 5 degree x 5 degree grid boxes, separately. The ratio of standard deviation to mean for area-averaged rain rate in the Pacific ITCZ is very regular and similar to that in GATE. Analysis of the area-averaged rainfall in the SPCZ shows a longer autocorrelation time scale than that in the ITCZ. The SPCZ exhibits significant power at the diurnal and semidiurnal frequencies, but the ITCZ shows only a marginally significant diurnal cycle in the data. The rainfall characteristics in the Pacific ITCZ appear to be similar to those in the Atlantic ITCZ in both autocorrelation time scale and diurnal variation. The mechanism driving convection in the ITCZ is suggested to be different from that in the SPCZ. Rainfall measurements by a sun-synchronous satellite visiting a spot twice per day will include a bias due to the existence of semidiurnal cycle in the SPCZ ranging from 5 to 10 percentage points. The bias in the ITCZ may be of the order of 5 percentage points. (Author's abstract)

SPATIAL VARIABILITY OF ANNUAL PRECIPITATION AND ENSO EVENTS IN WESTERN PERU.
Johns Hopkins Univ., Baltimore, MD. Dept. of Geography and Environmental Engineering.
T. D. Tapley, and P. R. Waylen.
Hydrological Sciences Journal HSJODN, Vol. 35, No. 4, p 429-446, August 1990. 10 fig, 6 tab, 20 ref. NSF Grant SES 8713738.

Descriptors: *Annual precipitation, *Climatology, *El Nino/Southern Oscillation, *Hydrologic models, *Model studies, *Peru, *Rainfall distribution, Areal precipitation, Drought, Rainfall, Spatial distribution, Stochastic hydrology.

The El Nino-Southern Oscillation (ENSO) phenomenon has been the focus of many diverse investigations since the mid 1960s. It is well known that the ENSO brings abnormally high precipitation to the northern coast of Peru. The probability distributions of annual rainfall totals at 18 stations from the north coast of Peru to the southern highlands and Altiplano were analyzed. It was found that most stations exhibit high interannual variability which cannot be satisfactorily modeled by a single lognormal distribution. Indices of the ENSO identified two precipitation regimes: the ENSO regime and the non-ENSO regime. Simple descriptive statistics of rainfalls within the two sub-samples indicate that during ENSO years the Altiplano and southern highland regions experience drought, with an average reduction in mean annual precipitation of 18%, while the north coastal region receives over 88% above non-ENSO rainfall. A mixed lognormal model of annual precipitation was successfully fitted to all stations. The estimated parameters reflect the contrasting response of the two regions to ENSO events. Pearson product-moment correlation matrices generated between stations for each sub-sample further support the hypothesized negative relationship between conditions on the northern coast and the Altiplano. The resulting model describes the stochastic nature of annual precipitation in the area and illustrates regional differences in the influence of ENSO. (Author's abstract)

DECADAL-SCALE CHANGES OF THE CIRCULATION IN THE TROPICAL ATLANTIC SECTOR ASSOCIATED WITH SAHEL DROUGHT.
Wisconsin Univ.-Madison. Dept. of Meteorology.
S. Hastenrath.
International Journal of Climatology IJCLEU, Vol. 10, No. 5, p 459-472, July/August 1990. 7 fig, 1 tab, 24 ref. NSF Grant ATM-8722410; NOAA Grant NA86AA-D-ACO64.

Descriptors: *Atmospheric circulation, *Climatic changes, *Climatology, *Drought effects, *Tropical regions, Africa, Air temperature, Arid climates, Atmospheric pressure, Clouds, Coasts, Drought, Sahara Desert, Wind.

Trends in the general circulation setting during 1948-1983 accompanying the progressive aggravation of drought in sub-Saharan Africa were investigated from ship observations over the tropical Atlantic and surface station records in western Africa. Decadal-scale circulation changes in the Atlantic sector include a pressure rise over the tropical North Atlantic; southward displacement of the near-equatorial wind confluence and associated maximum cloud belt; acceleration of the northeast trades and possibly a strengthening of the South Atlantic trades, along with increasing cloudiness in the equatorial zone; increasing cloudiness over the tropical North Atlantic and Central American seas; and cooling of surface waters in a band across the tropical North Atlantic contrasting with warming in the South Atlantic. These changes occurred in all seasons, but were most pronounced at the height of boreal summer. Records at land stations in western Africa show that near the coasts the temperature and pressure trends are consistent with the adjacent ocean areas. In the interior of sub-Saharan Africa, warming trends prevail in boreal summer, with concomitant downward pressure trends. During the past four decades, the near-equatorial wind confluence over the eastern Atlantic migrated southward by 200 km in July-August and 150 km for the rainy season as a whole. These circulation shifts are large enough to account for the observed downward trend in Sahel rainfall. (Author's abstract)

REGIONALIZATION AND SPATIAL ESTIMATION OF ETHIOPIAN MEAN ANNUAL RAINFALL.
Lund Univ. (Sweden). Dept. of Physical Geography.
L. Eklundh, and P. Pilesjo.
International Journal of Climatology IJCLEU, Vol. 10, No. 5, p 473-494, July/August 1990. 21 fig, 7 tab, 19 ref.

Descriptors: *Annual precipitation, *Climatic data, *Climatology, *Data interpretation, *Ethiopia, *Rainfall distribution, Climatic zones, Dispersion, Factor analysis, Model studies, Model testing, Precipitation mapping, Principal component analysis, Rainfall, Regression analysis, Spatial distribution.

A need has been recognized for developing methods that will lead to the generation of a reliable mean annual precipitation database for Ethiopia. Multiple regression models have been formulated that explain the mean annual rainfall as a function of elevation and geographical location. The estimations, based on yearly values from a data set of 63 Ethiopian rainfall stations with records between 1969 and 1985, were developed for the whole country as well as for the already existing Food and Agricultural Organization (FAO) rainfall pattern regions, and a new zonation derived by principal component and common factor analyses (PCA/CFA). The optimal zonation was derived by testing 36 different combinations resulting in different rainfall pattern regions. The alternatives tested were: correlation and covariance dispersion matrices, PCA and CFA eigentechniques, unrotated and rotated components/factors and number of possible significant components/factors. Principal component analysis of covariance matrix, rotation and seven extracted components gave by far the best relationship between mean annual rainfall, elevation, and geographical location. Models explaining at least 72 percent of the variation in rainfall were constructed for regions covering about 98 percent of the country, which is better than models based on the FAO rainfall pattern regions and a model for the whole country. (Author's abstract)
W91-01466

TEMPORAL AND SPATIAL CHARACTERISTICS OF ANNUAL PRECIPITATION OVER THE BALKANS IN THE TWENTIETH CENTURY.
Thessaloniki Univ., Salonika (Greece). Inst. of Meteorology and Climatology.
P. Maheras, and F. Kolyva-Machera.
International Journal of Climatology IJCLEU, Vol. 10, No. 5, p 495-504, July/August 1990. 4 fig, 3 tab, 23 ref.

Descriptors: *Annual precipitation, *Balkans, *Climatology, *Mediterranean Sea, *Rainfall distribution, *Temporal distribution, Atmospheric circulation, Drought, Principal component analysis, Spatial distribution, Statistical analysis.

There has been great interest recently in fluctuations in precipitation the past century for western and central Europe and for the western Mediterranean. The annual totals of precipitation were studied for 12 stations in the Balkan area for a period of 92 years (1894-1985). The homogeneity of the precipitation series and their statistical characteristics were analyzed. An abrupt climatic change was found at the station of Belgrad, and a statistically significant trend of annual precipitation was found for various periods at the stations of Kerkyra, Patras, Hvar, and Sarajevo. Persistence was ascertained only for the Belgrad station. The application of principal component analysis yielded three groups of stations. Group A includes northern and continental stations, group B includes stations of the Ionian and Adriatic Seas, and group C includes the stations of Thessaloniki and Athens. The most important period of fluctuations covers the years 1933-1953, when a humid period was followed by a dry period. The most recent 5-year period was a very dry one. Finally, comparisons between rainfall fluctuations and types of circulation show that the predominance of meridional circulation over the Balkans results in an increase of precipitation, while a zonal circulation results in a decrease of precipitation. RAIN SCAVENGING OF TEPHRA AEROSOLS FROM MOUNT ST. HELENS 1980 ERUPTIONS.
Arkansas Univ., Fayetteville. Dept. of Geology.
G. H. Wagner, and K. E. Steele.
Journal of Applied Meteorology JAMOAX, Vol. 29, No. 5, p 368-374, 1990. 1 fig, 4 tab, 11 ref.

Descriptors: *Ash, *Mineralogy, *Precipitation scavenging, *Tephra, *Volcanoes, Aerosols, Atmospheric circulation, Clay minerals, Illite, Kaolinite, Meteorological data, Mount St Helens, Particulate matter, Quartz, Rainfall disposition, Washington.

Mount St. Helens in southern Washington state had three major eruptions in 1980: 18 May, 25 May, and 12 June. Tephra in the atmosphere from these eruptions was traced by analyzing the particulate matter from weekly rain collections at 62 National Atmospheric Deposition Program sites

across the United States. The particulate matter was on 0.45 micron pore-sized filters (47 mm diameter) in amounts of 0-214 mg. Identification of tephra in the particulate matter was made by x-ray diffraction, identification of feldspar (70% of the tephra), and chemical analyses compared to a standard tephra. Tephra was identified at sites in the path defined by observable amounts on the ground and outside and beyond this path. Dilution of the tephra by other aerosols varied from 20% near Mount St. Helens to about 300% at downwind sites, which were two days and 3000 km from Mount St. Helens. Atmospheric cleanup of the tephra at a given site occurred in 1-2 weeks, sometimes in a few days, as measured by the particulate matter in rain. Particulate matter captured in rains before the eruptions was mainly alpha quartz, feldspar, illite, kaolinite and organics with an average flux for the United States of 112 kg per ha per week. FURTHER EXPLORATORY EVALUATIONS OF GROSSVERSUCH IV USING HAILPAD DATA: ANALYSIS OF HAIL PATTERNS AND STRATIFICATION BY STORM TYPE FOR SEEDING EFFECT.
Groupement National d'Etudes des Fleaux Atmospheriques, Aubiere, France.
J. F. Mezeix.
Journal of Applied Meteorology JAMOAX, Vol. 29, No. 5, p 401-417, 1990. 7 fig, 9 tab, 28 ref, append.

Descriptors: *Cloud seeding, *Data interpretation, *Hail, *Hydrologic models, *Meteorological data, *Soviet Union, *Storms, Areal precipitation, Distribution patterns, France, Italy, Model studies, Precipitation mapping, Spatial distribution, Switzerland.

In the Grossversuch IV experiment, scientific groups from three countries (Switzerland, Italy, and France) worked together to test the Soviet hail suppression method, based on the concept of beneficial competition of hailstone embryos. Further exploratory evaluations were made of the hail suppression experiment using the spatial distribution of ground-measured variables within hail patterns. The possibility of a seeding effect limited to a part of a hailfall or to various objectively stratified types of precipitation cells was investigated. The results show an increase in the ratio of the hailed areas with maximum hailstone diameters greater than 10 mm versus the total hailed area, and an increase in the maximum hailstone diameter for type II repetitive evolution cells. Differences observed for the main test variables in relation to the various cell types were shown to largely exceed those that could stem from a possible seeding effect. A satisfactory physical interpretation of the differential tendency related to the storm type is impossible, however, because the simple storm model on which the Grossversuch IV experiment is not based on three-dimensional storm measurements. Future test experiments should be based on several test variables characteristic of the overall hailfall phenomenon and especially of the area factor. In addition, storms should be physically stratified in an objective manner. (Author's abstract)

THUNDERSTORMS ABOVE FRONTAL SURFACES IN ENVIRONMENTS WITHOUT POSITIVE CAPE. PART I: A CLIMATOLOGY.
National Oceanic and Atmospheric Administration, Boulder, CO. Environmental Research Labs.
B. R. Colman.
Monthly Weather Review MWREAB, Vol. 118, No. 5, p 1103-1121, 1990. 19 fig, 21 ref. NSF Grant ATM-8019301.

Descriptors: *Climatology, *Convective precipitation, *Meteorology, *Thunderstorms, *Weather patterns, Advection, Atmospheric circulation, Atmospheric pressure, Climatic data, Convection, Frequency distribution, Meteorological data collection, Wind.

Thunderstorms occur frequently above frontal surfaces in environments without positive convective available potential energy (CAPE). The climatology of such storms were studied for the conterminous United States using a dataset consisting of 1093 observations made over a 4-year period. A composite of the dataset shows that the typical 'elevated' thunderstorm occurs northeast of an associated surface low pressure center, and north of a surface warm front in a region with northeasterly surface winds. The planetary boundary layer is generally very stable. The thunderstorms are usually found in the left exit region of a low-level wind maximum. The large-scale environment is strongly baroclinic with large vertical wind shear and warm advection. Several of the identified characteristics suggest that frequently elevated thunderstorms are the result of physical mechanisms different from those fundamental to surface-based thunderstorms, e.g., for elevated thunderstorms there is generally very little positive CAPE in the environment, as the atmosphere is slightly more stable than moist adiabatic above the frontal inversion. The annual frequency distribution of elevated thunderstorms is bimodal, with a primary peak in April and a secondary peak in September. The events are concentrated in an area extending northward from the central Gulf Coast along the Mississippi River valley. Nearly all winter season thunderstorms east of the Rocky Mountains are of the elevated type, except those over the Florida Peninsula, where surface-based convection persists throughout the year. Most of the winter season elevated thunderstorms occur near the Gulf Coast downstream from migrating cyclones. (See also W91-01482) (Author's abstract)

Thunderstorms occur above frontal surfaces frequently in environments without positive convective available potential energy (CAPE). An impressive outbreak of elevated thunderstorms during the Atmospheric Variability Experiment-Severe Environmental Storms and Mesoscale Experiment were studied. The thunderstorms occurred in three convective impulses, each of which developed in a warm sector before propagating onto the frontal surface; subsequent thunderstorms developed over the frontal surface. While in the warm sector, the convection was supported by an extremely unstable boundary layer. However, this convective energy quickly diminished above the frontal surface and thunderstorms continued and developed for many hours in an essentially stable hydrostatic environment. During the lifetime of these impulses, mesoscale updrafts developed and moved with the convective areas, maintaining nearly steady-state systems with strong low-level inflow. The environment was found to be symmetrically neutral in the region of the inflow. Numerous pressure waves were observed in association with the elevated thunderstorms, yet these features were evidently not important in triggering the storms. An investigation of a convective band that formed above the frontal surface revealed that the development probably took place in two steps. Initially, the high potential temperature contour for a saturated environment in the air overlying the frontal inversion was stable to vertical displacements, but inertially unstable. Then, along the instantaneous path of the unstable parcel, the thermodynamic structure changed, the parcel became gravitationally unstable, and upright convection resulted. PRECIPITATION AND ENVIRONMENTAL CONDITIONS DURING ACCRETION IN CANADIAN EAST COAST WINTER STORMS.
Atmospheric Environment Service, Downsview (Ontario).
R. E. Stewart, R. W. Crawford, N. R. Donaldson, T. B. Low, and B. E. Sheppard.
Journal of Applied Meteorology JAMOAX, Vol. 29, No. 7, p 525-538, July 1990. 13 fig, 1 tab, 28 ref, append.

Descriptors: *Accretion, *Canada, *Ice formation, *Meteorology, *Precipitation, *Storms, Air temperature, Freezing, Ice, Model studies, Particle shape, Remote sensing, Simulation, Snow, Wind velocity.

Ice and snow accretion cause a large amount of damage in winter storms with consequences ranging from slight to disastrous. Precipitation and environmental conditions occurring during accretion in Canadian east coast winter storms have been investigated. Accretion is generally associated with snow, freezing rain, and ice pellets within saturated conditions. Precipitation types are sometimes invariant but usually evolve during individual accretion events. Accretion events are also generally associated with moderate wind speeds (average of 7.5 m/s) and warm temperatures (between -1 C and 0 C are most common). Remote sensing of particle shapes and terminal velocities are capable of identifying some of the features of these precipitation types. Model calculations indicate that a detailed understanding of precipitation characteristics, such as the nature of wet snow, is needed to accurately simulate accretion. (Author's abstract)

THUNDERSTORMS, COSMIC RAYS, AND SOLAR-LUNAR INFLUENCES.
M. D. Lethbridge.
Journal of Geophysical Research (D) Atmospheres JGRDE3, Vol. 95, No. 9, p 13,645-13,649, August 20, 1990. 4 fig, 25 ref.

Descriptors: *Cosmic rays, *Meteorology, *Solar radiation, *Synergistic effects, *Thunderstorms, Frequency analysis, Geophysics, Particulate matter, Storms.

Cosmic ray and thunderstorm frequency was studied by superposed epoch analysis of thunderstorms over the eastern two thirds of the United States for 1957-1976. A decrease in thunderstorms was observed at the time of high cosmic rays and an increase in thunderstorms 2-4 days later. When data for spring and fall months were used, the minimum deepened again and was significant at less tan the 0.01% level. It is believed that when the sun, earth, and moon are aligned, particulate matter in the lower stratosphere is modulated and acted upon by cosmic rays, bringing about an immediate decrease in thunderstorms. FOURIER DOMAIN SHAPE ANALYSIS METHODS: A BRIEF REVIEW AND AN ILLUSTRATIVE APPLICATION TO RAINFALL AREA EVOLUTION.
Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
P. Kumar, and E. Foufoula-Georgiou.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2219-2227, September 1990. 4 fig, 14 ref. NSF Grants CES-8708825 and BSC-8957469.

Descriptors: *Fourier analysis, *Mathematical analysis, *Precipitation, *Rainfall area, Weather forecasting.

Morphological shape analysis techniques offer valuable tools for the study of several hydrologic and atmospheric processes. Detailed description of patterns, as well as evolution and comparison of patterns can be efficiently performed in the Fourier domain and by means of a finite number of Fourier descriptors. Three Fourier domain shape analysis methods are briefly summarized: the complex plane method, the angular direction method, and the polar coordinates method. The complex plane method, applicable to any kind of shape, is more versatile than the other two methods and is also computationally efficient. The use of the complex plane method for studying the evolution of rainfall areas within a radar-depicted rainfall field for the purpose of short-term precipitation forecasting is illustrated. MONITORING OF RAINFALL IN RELATION TO THE CONTROL OF MIGRANT PESTS.
Reading Univ. (England). Dept. of Meteorology.
J. R. Milford, and G. Dugdale.
Philosophical Transaction of the Royal Society of London. Series B. Biological Sciences PTRBAE, Vol. 328, No. 1251, p 689-704, June 30, 1990. 6 fig, 1 tab, 17 ref.

Descriptors: *Habitats, *Hydrologic budget, *Insect control, *Meteorology, *Rainfall distribution, *Satellite technology, *Soil water, Remote sensing, Terrain analysis, Topography, Vegetation, Weather forecasting, Weed control.

Of all climatic parameters, rainfall has the greatest variability in space as well as time. It also has the greatest influence on the breeding and behavior of migrant pests, such as locusts, supplying the moisture needed both for their development and for the growth of vegetation to sustain a population. Soil moisture controls both processes directly but cannot be adequately surveyed even by remote sensing techniques, so water balance models are relied upon to interpret rainfall measurements and to forecast pest populations. Both terrain and rainfall are very inhomogeneous on the kilometric scale, a scale which is not matched by observations either from conventional rain gages or current meteorological satellites. Modeling the effects of rainfall must take account of these inhomogeneities. However, it is clear that more detailed studies of rainfall-habitat interaction are needed to derive soil moisture from rainfall estimates by using knowledge of the microtopography. Such relationships must be capable of being generalized so that future monitoring by satellites, essential to give complete and uniform coverage, can be realistically interpreted. (Author's abstract)

NEW EQUATION FOR THE ATMOSPHERIC ENERGY BUDGET (EINE NEUE GLEICHUNG FUER DIE ATMOSPHAERISCHEN ENERGIEHAUSHAELTE).
Vienna Univ. (Austria). Inst. fuer Meteorologie und Geophysik.
M. Hantel.
Wetter und Leben WTLBAR, Vol. 41, No. 1/4, p 95-108, 1989. 4 fig, 16 ref. English summary.

Descriptors: *Climatology, *Mathematical equations, *Meteorology, *Weather forecasting, Energy, Latent heat, Precipitation, Rainfall.

The moisture budget equation of the atmosphere comprises mesoscale (routinely measurable) and sub-mesoscale (non-measurable) contributions. The sub-mesoscale terms are divergences of moisture flux and rain flux. These fluxes play an important role in the moisture budget. In order to diagnose them objectively the budget equation for sensible heat was added and coupled to the budget equation for latent heat via the rain flux. By means of the Bowen ratio in the free atmosphere the equations are closed, yielding a governing differential equation of the first order in pressure for the sub-mesoscale heat flux. This equation is in simple cases analytically solvable and in all cases numerically solvable. In this way the mesoscale atmospheric measurements yield the sub-mesoscale heat flux and, by means of algebraic and quadrature formulae, the rain and moisture flux. (Author's abstract)

CHANGEABLE WEATHER-A CHAOTIC PHENOMENON TRIGGERED OFF BY MESOSCALE PRECIPITATION-EDDIES (WETTERLAUNEN ALS CHAOTISCHE MESO-SKALIGE STRUKTUREN).
Vienna Univ. (Austria). Inst. fuer Meteorologie und Geophysik.
G. Skoda.
Wetter und Leben WTLBAR, Vol. 41, No. 1/4, p 117-122, 1989. 2 fig, 1 tab, 6 ref. English summary.

Descriptors: *Climatology, *Cloud physics, *Meteorology, *Precipitation, Condensation, Logistic maps, Mathematical equations.

The rate of condensation quickly enters a chaotic region according to a simple nonlinear technique, the logistic map. The logistic map which is probably the simplest nonlinear difference equation, appears in many applications. Considering the process of condensation, if the number of cloud particles, N, grows at a given rate v, the iterations, Ni+1, of particle formation display a rather complicated behavior as a function of the external parameter v, which becomes chaotic at v greater than 2.5. As specific growth rates of condensation between different scales of precipitation-eddies are compared, v is found within the scales of MESO-beta, a structural lifetime which is greater than 36 hr, and MESO-gamma, 0.5 to 4 hr, with critical values of 2.5. This corresponds to the high intermittency of precipitation. High rates of condensation or cloud formation lead to precipitation eddies and the system enters a chaotic region. (Author's abstract)

EXTREME, SINGULAR AND COHERENT PRECIPITATION IN THE CATCHMENT BASIN OF THE UPPER INN RIVER (EXTREME, SINGULAERE UND KOHAERENTE NIEDERSCLAEGE IM GEBIET DES APLINEN INN).
F. Fliri.
Wetter und Leben WTLBAR, Vol. 41, No. 1/4, p 141-152, 1989. 1 fig, 7 tab, 8 ref. English summary.

Descriptors: *Austria, *Precipitation, *Storms, *Weather patterns, Hydrographic models, Hydrographs, Inn River, Mathematical models, Rainfall.

Due to a series of sudden intense and individually catastrophic downpours which occurred in both parts of the Tirol in 1981, 1983 and 1985, a study was conducted by the University of Innsbruck and the Obervinschgau of Marienberg in 1985. Subsequently, more catastrophic instances occurred in the summer of 1987, and a regional hydrographic investigation was needed. Using daily precipitation values from 46 stations in the catchment basin of the upper Inn River (9313 square m) from 1946 to 1987 between Mont Blanc and Hohen Tauern, the mean annual and absolute maxima for periods of one, two and more consecutive days and estimates of 30 and 100 year maxima were determined. A relationship was established by means of a regression analysis between mean annual maxima and basin size that permited estimates of extrema in smaller areas. The frequency distribution and extreme values of mean basin precipitation of periods of one or of several consecutive days are presented and the occurrence of spatially singular or coherent precipitation was determined to be dependent on precipitation totals. NEW SNOW IN THE URBAN AREA OF VIENNA (NEUSCHNEE IM RAUM WIEN).
Zentralanstalt fuer Meteorologie und Geodynamik, Vienna (Austria).
H. Mohnl.
Wetter und Leben WTLBAR, Vol. 41, No. 1/4, p 269-277, 1989. 6 fig, 2 tab, 4 ref. English summary.

Descriptors: *Austria, *Public policy, *Snow forecasting, *Snow management, *Statistical models, *Weather forecasting, Climatic data, Precipitation, Roads, Snow accumulation, Vienna.

In urban areas, freshly fallen snow is an undesired phenomenon because it generates substantial problems for public traffic and technical systems. Therefore, in regional planning, climatic statistical parameters like means, percentiles of the frequency distributions, and return periods of extreme values for the amount of freshly fallen snow are used to optimize the fundamental relationships between human life and the climate. Between 1951/52 and 1980/81, statistics were collected within the city of Vienna and the bordering Vienna Woods on the height of new fallen snow. The data from areas uninfluenced by the heat of the city show a strong linear dependence at the levels of lowlands (from 200 m to 500 m) on altitude. The data were filtered with a Gaussian low pass to suppress periods of less than 20 years to show the variation of the annual amount of freshly fallen snow within the past 90 years. Journal of the Atmospheric Sciences JAHSAK, Vol. 47, No. 13, p 1525-1540, July 1990. 11 fig, 59 ref, 2 append.

Descriptors: *Data acquisition, *Hail, *Meteorology, *Polarimetric radar measurements, *Precipitation, *Radar, *Rain, Correlation analysis, Correlation coefficient, Hydrometeors, Reflectance, Reflectance techniques, Reflectivity, Remote sensing.

Polarimetric radar measurements provide bulk estimates of the shapes of the ensemble of hydrometeors in the radar resolution volume. There is evidence that the shape of a rain drop is related to its size. Also, rain drops exhibit little or no canting and fall with their minor axes oriented vertically. The work of Seliga and Bringi showed that the existence of such accurate relation between rain drop shape and size can be exploited to obtain an improved estimation of rainfall from polarimetric measurements. An examination was made of the utility of the correlation coefficient between linear orthogonally polarized echoes for determining precipitation type and gaging hail size. Models and measurements from pure rain coincide in predicting very high correlations (0.98); similar results are obtained with pure hail. Several mechanisms could cause the lowering of the correlation but the behavior of the examined data is definitely attributed to a mixture of hydrometeor types. This decrease is an indicator of hail size; it is shown theoretically that in at least two other realistic situations the correlation would decrease the hail size. For the examined case a model of hail shape and orientation during fall is able to reproduce the essential features of polarimetric measurements. It suggests, together with data obtained in the current investigation and data from other investigations, that substantial negative differential reflectivity (about -1 dB) in a region of high reflectivity factor values is caused by hailstones larger than about 2 cm in diameter. ENTRAINMENT AND MIXING PROCESSES AS RELATED TO DROPLET GROWTH IN WARM MIDLATITUDE AND TROPICAL CLOUDS.
Centre National de la Recherche Scientifique, CRPA, Magny les Hameaux, France.
E. Hicks, C. Pontikis, and A. Rigaud.
Journal of the Atmospheric Sciences JAHSAK, Vol. 47, No. 13, p 1589-1618, July 1990. 30 fig, 6 tab, 55 ref, append.

Descriptors: *Cloud physics, *Clouds, *Condensates, *Entrainment, *Meteorological data, *Mixing, *Precipitation, *Rain, Data acquisition, Data collections, France, Tropical regions.

Aircraft measurements in warm continental cumuli and in tradewind maritime bandclouds are analyzed in order to determine the influence of entrainment and mixing processes on the evolution of condensate droplet spectrum. The results provide some insight on the similarities and differences between maritime and continental warm cumuli as related to warm rain production. The entrainment sources are determined by Paluch's thermodynamic method and contrasting results are obtained. Cloud top entrainment prevails in the midlatitude isolated cumuli whereas bandclouds of both data sets are subject to multilevel lateral entrainment. Microphysical characteristics such as the droplet concentration and the spectral peak radius are analyzed in relation to the dilution degree of cloud parcels in order to examine the mixing process involved during entrainment events. The findings support the inhomogeneous mixing hypotheses with total evaporation of some droplets of all sizes during mixing in all observed continental cases, whereas the dominant process in all studied maritime clouds is closer to the homogeneous picture. In both databases, the highest concentrations of droplets in the large droplet tail of the spectrum are found in samples with an intermediate level of dilution, thus confirming the influence of dilution on enhanced droplet growth. The role of entrainment, mixing and subsequent cloud dilution in the production of large droplets as shown seriously restricts the use of simple parameterizations of precipitation water initiation in cloud models. PRECIPITATION PRODUCTION IN A LARGE MONTANA HAILSTORM: AIRFLOW AND PARTICLE GROWTH TRAJECTORIES.
National Center for Atmospheric Research, Boulder, CO.
L. J. Miller, J. D. Tuttle, and G. B. Foote.
Journal of the Atmospheric Sciences JAHSAK, Vol. 47, No. 13, p 1619-1646, July 1990. 23 fig, 1 tab, 67 ref.

Descriptors: *Cloud physics, *Hail, *Meteorology, *Precipitation, *Radar, Air circulation, Clouds, Doppler radar measurements, Graupel, Precipitation mapping, Weather.

Computations of air motion and precipitation growth using winds derived from Doppler radar measurements were analyzed to reveal important flow features that influenced the production of precipitation during the nearly steady phase of a well-observed severe storm in Montana that produced hail as large as 5 cm in diameter. Based on particle growth calculations, measurements by radar and research aircraft, cloud photography and direct hailstone examination, four general sources of hail embryos were apparent: (1) graupel grown along the updraft fringes, (2) a derivative of the former consisting of drops produced by melting graupel, (3) water drops shed from melting hail, and (4) shedding from hailstones that were in wet growth conditions. The graupel embryos were deduced to originate primarily in two columnar regions on the flanks of the updraft core. Following the embryo growth stage, three types of hail growth trajectories were found: (1) those passing into the southern (cyclonic) branch of the middle-to-upper level airflow, (2) those passing into the northern (anticyclonic) branch of this flow, and (3) those passing in a nearly straight line through the updraft core in midlevels (preferentially the northeastern side of the core). Of these the straight-line trajectory produced the largest hail. Precipitation from graupel grown in the western updraft fringes, from drops produced by transport and melting of these graupel grown in the northern updraft fringes was necessary to explain the observed patterns of radar reflectivity, dual-wavelength ratio and specific attenuation. Further, only embryos from the west and south flanks led to large diameter hail near where stones of similar sizes were observed from aircraft near the ground. (Author's abstract)

USE OF DAILY VALUES OF SURFACE PARAMETERS AT DURBAN AND CAPE TOWN TO DETERMINE THE PRECIPITABLE WATER CONTENT OF THE ATMOSPHERE.
Natal Univ., Pietermaritzburg (South Africa). Dept. of Geography.
O. S. McGee, and R. N. De Vos.
South African Journal of Science SAJSAR, Vol. 85, No. 9, p 602-603, September 1989. 2 tab, 3 ref.

Descriptors: *Air circulation, *Meteorological data collection, *Meteorology, *Precipitation, *Regression analysis, *South Africa, *Water vapor, Data collections, Data interpretation, Dewpoint, Mathematical studies, Synoptic analysis, Temperature.

The precipitable water (vapor) or total content of vapor above any locality on the earth's surface plays an important role in hydrology and meteorology. Its value has been shown to differ according to the local airflow regime which prevails at the time and may be predicted from surface dewpoint values using a linear regression equation which is specific to the prevailing airflow type. This type of regression equations is customarily based on monthly mean values of precipitable water and surface dewpoint. South African upper air data was examined to show that daily values may be used, without combining them into monthly values, to generate multiple linear regression equations which differ for different airflow types and according to season. A preliminary investigation of upper air data for both Cape Town and Durban between 1969 and 1987 included the calculated precipitable water vapor, as well as surface temperature, dewpoint temperature, air pressure and wind speed. Exploratory regression analyses of precipitable water values vs. surface dewpoint temperatures were performed at each station. A multiple regression was then performed using all selected variables. The use of the daily data (not monthly statistics) was found to be dependent on the determination of airflow types at the surface. Since this was done by computer, the actual synoptic situations at the stations should be distinguished. This would presumably lead to different data groupings. (Korn-PTT)

CLIMATIC CONTROL OF VEGETATION DISTRIBUTION: THE ROLE OF THE WATER BALANCE.
Cornell Univ., Ithaca, NY. Section of Ecology and Systematics.
N. L. Stephenson.
American Naturalist AMNTA4, Vol. 135, No. 5, p 649-670, May 1990. 4 fig, 2 tab, 85 ref.

Descriptors: *Climatology, *Distribution patterns, *Ecology, *Hydrologic budget, *Literature review, *Vegetation, Energy, Evapotranspiration, Precipitation, Temperature, Water deficit.

The water balance describes climate as it is sensed by plants: as the interaction of energy and water in the environment. Discriminant analysis showed that the distribution of North American plant formations was more highly correlated with the water balance (actual evapotranspiration and deficit) than the more traditional measures of climate (such as temperature and precipitation) used in other studies. Much of the improved correlation could be contributed to the ability of the water balance to distinguish between climates similar in mean annual energy and water supplies, but different in the seasonal timing of the two. Consideration of the water balance aided in the interpretation of possible mechanisms controlling the distribution of plant formations. For example, coniferous forests occurred at low actual evapotranspiration (low simultaneous availability of water and energy), consistent with the suggestion that conifers are better adapted than deciduous trees to environments with a low potential for primary production. A better understanding of the mechanisms by which climate can control the distribution of vegetation will help in predicting the effects of changing climate on the future distribution of vegetation types. This literature review article attempts to enhance current understanding by discussing: (1) the relationship between the energy balance and the water balance; (2) biological importance of the water balance; (3) correlations between vegetation and climate; (4) statistical comparisons between the water balance and other climatic parameters; (5) the distribution of North American plant formations relative to the water balance; and (6) the distribution of coniferous and deciduous forests. PERSPECTIVE ON EL NINO AND LA NINA: GLOBAL IMPLICATIONS FOR STREAM ECOLOGY.
New Mexico Univ., Albuquerque. Dept. of Biology.
M. C. Molles, and C. N. Dahm.
Journal of the North American Benthological Society JNASEC, Vol. 9, No. 1, p 68-76, March 1990. 3 fig, 1 tab, 66 ref. NSF Grant Nr. BSR-8616438.

Descriptors: *Climatology, *El Nino, *El Nino/Southern Oscillation, *Gila River, *La Nina, *Meteorology, *Pecos River, *Streamflow forecasting, *Weather forecasting, New Mexico.

Analyses of flow data for the Gila (60 years) and Pecos (68 years) Rivers in New Mexico showed that spring flows during snowmelt were significantly increased during El Nino years (periods of elevated sea surface temperature and reduced barometric pressure in the eastern tropical Pacific) and

LIBRARY U. OF I. URBANA CHAMPAIGN

significantly decreased during La Nina years (periods of reduced sea surface temperature and elevated barometric pressure). Over the period of record for these two rivers, mean spring runoff during El Nino years was 2.3 to 3.2 times higher than during medial years and 6.0 to 7.4 times higher than during La Nina years. The results of this study indicate a strong correspondence between El Nino-Southern Oscillation (ENSO) phenomena and stream flow in New Mexico. These results also suggest that, in this region, the increasingly accurate, and remote forecasting of ENSO phenomenon, often months in advance of the event, could be used to place future studies of biotic responses to variations in flow on a more predictive basis. Since it has been shown that the ENSO phenomenon affects the weather of large portions of the North American continent and tropical and subtropical regions worldwide, a similar potential for improved study designs exists for other regions. Descriptors: *Acid rain, *Chemical composition, *Chemistry of precipitation, *Meteorology, *Path of pollutants, *Precipitation, *Spatial distribution, Data collections, Meteorological data collection, Topography, Variability, Wales.

Bulk precipitation chemistry was monitored monthly for 18 months at 10 mountain sites and one coastal site in north Wales, U. K. The sites ranged in altitude from sea level to 891 m above sea level in an area where annual rainfall ranges from 1300 to 4000 mm. The precipitation was acidic (weighted mean H(+) of 23 microequivalents/L, pH 4.64), although ionic composition was dominated by sea salts. However, approximately 70% of the SO4 was not of sea salt origin. Concentrations of excess SO4 and NO3 were small (42 and 11 microequivalents/L, respectively) relative to polluted areas of Europe, although deposition rates were large (1.62 g S/sq m/year and 0.54 g N/sq m/year as NO3) due to the high annual rainfall. There was considerable spatial variability in the solute concentrations and deposition data which resulted from the effects of the complex topography of the area. Simple linear relationships between solute deposition and rainfall quantity were not generally observed except for sea salt deposition on seaward north-west facing slopes. (Author's abstract)

SURFACE ENERGY BALANCE OF A PERENNIAL SNOWBANK, MELVILLE ISLAND, NORTHWEST TERRITORIES, CANADA.
Erindale Coll., Mississauga (Ontario). Dept. of Geography.
K. L. Young, and A. G. Lewkowicz.
Arctic and Alpine Research ATLPAV, Vol. 22, No. 3, p 290-301, August 1990. 9 fig, 1 tab, 48 ref.

Descriptors: *Arctic regions, *Climatology, *Energy, *Melville Island, *Permafrost, *Snowpack, Ablation, Albedo, Canada, Latent heat, Radiation, Snowmelt.

The energy balance of a large perennial snowbank located in the continuous permafrost zone was examined during the summer of 1986. Three meteorological towers allowed energy fluxes to be determined for separate zones of the snow bank. Over the melt season, net radiation accounted for 85% of the energy absorbed by the snow surface, while sensible heat contributed 15% and latent heat was a net loss of 2%. Albedo varied across the snowbank due to an irregular distribution of surface aeolian deposits. Direct measurements of snowmelt from a snow survey compare favorably with calculated values obtained from the energy balance. The net shortwave radiation flux was a significant influence on ablation, explaining an average 77% of the variance in the measured melt. The predominance of the radiant fluxes is attributed to the large size of the snowbank and its sustained melt through the cool arctic summer. (Author's abstract)

An integrated model for the simulation and prediction of snowmelt quantity and quality from seasonal snow cover in a mountain basin has been developed in Czechoslovakia. To find the best method for modeling snow accumulation, and the accumulation of SO4(-2) washout, an approach was attempted which would satisfactorily combine hydrological and chemical modules. Surface runoff acidity and precipitation acidity were related by quantifying the progressive hydrological and chemical input and output sequences of the physical components. The Bystrianka drainage basin was considered to be representative of accumulation under mountain conditions. Measurements of snow cover were supplemented by sampling for snow quality, to characterize the accumulation and evaluate the chemical composition of both the snow and stream water, and to find out the concentration of sulfate at various sampling points throughout the winter season. From the daily SO4(-2) measurements, it was found that in periods without any SO4(-2) coming from the basin, the change in the flow corresponded to the outflow curve equation. The values of the sulfate concentration were influenced by their source, a rock medium. With the discharge increase which follows from snowmelt or precipitation, an increase of SO4(-2) contents occurs. This increase or decrease in the SO4(-2) concentration depends upon the discharge amount and the duration of the contribution episode. The whole model was tested using data for three winter seasons, wherein it was concluded that the model only moderately satisfies the fitting requirements. Differences which occur between the measured and calculated values occur in the period of intensive snowmelt. (Fish-PTT)

The evaluation of snowmelt is not only important in the effective utilization of water resources and the forecasting of flood runoff, but it also influences climate through the change in ground surface properties. A model of snowmelt was developed on the basis upon the heat balance of the snow cover, with the assumption of a linear temperature profile in the snow. The model predicts the amount of snowmelt, the heat balance components, the snow surface temperature, and freezing depth. The components necessary as the input data to the model are: the solar radiation, downward longwave radiation, wind velocity, air temperature, and humidity. Also, for the parameters of snow cover; the albedo, density, water content, and thermal conductivity need to be known prior to the calculation. This simulated process of snowmelt agrees well with observations made over a flat farmland. Moreover, the calculated snow surface temperature corresponds with the actual value. As the maximum water content or thermal conductivity increases, the calculated snowmelt decreases because the snow surface temperature is kept higher during the night for larger maximum water content and thermal conductivity. Snowmelt largely depends on albedo. Finally, the model was applied to a large area to estimate inflow to a dam. In this calculation, it was assumed that the initial snow water equivalent increased linearly with altitude. The predicted values of inflow are consistent with those observed. (Fish-PTT)

VARIATIONAL SENSITIVITY ANALYSIS, DATA REQUIREMENTS, AND PARAMETER IDENTIFICATION IN A LEAKY AQUIFER SYSTEM.
California Univ., Los Angeles. Dept. of Civil Engineering.
W. W. G. Yeh, and N. Z. Sun.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1927-1938, September 1990. 8 fig, 10 tab, 26 ref. NSF Contract CES8814888, USGS Contract 14-08-0001-G1499.

Descriptors: *Aquifer systems, *Data requirements, *Groundwater movement, *Leaky aquifers, *Mathematical models, *Model studies, *Sensitivity analysis, Algorithms, Aquitards, Confined aquifers, Error analysis, Pumping tests, Unconfined aquifers.

The adjoint state sensitivity method was developed to aid the analysis of a pumping test design for parameter identification in a leaky aquifer system. The system considered consists of an unconfined aquifer overlaying an aquitard which overspreads a confined aquifer. The adjoint equations are derived in the continuous form without discretizing the governing equations and are expressed in terms of 'convection-diffusion' equations with time dependent coefficients. The multiple cell balance (MCB) method was used to solve the nonlinear governing equations as well as their adjoint equations. Algorithms were developed for calculating sensitivity coefficients of heads in each layer of an aquifer with respect to various parameters. A concept called 'contribution of an observation' is introduced which can be used to measure the usefulness of an observation in connection with data requirements for parameter identification. It links experimental design with observation errors and the requirement of model application. The sufficiency of an observation system for parameter identification can be evaluated at the design stage before extensive resources are committed to data collection. A numerical example is given to verify the proposed method and to explain its applicability to the design of a pumping test. (Author's abstract)

Descriptors: *Austria. *Snow accumulation, *Snow management, *Snow removal, *Weather forecasting, Burgenland, Precipitation, Public policy, Roads.

Since the winter of 1985-1986, The Department of Synoptic Meteorology of the Central Office of Meteorology and Geodynamics (ZAMG) produced weather forecasts to determine the needs of the winter road service in Lower Austria and during the 1986-1987 season for Burgenland as well. During the first winter, forecasts were made twice daily, once in the morning and once in the afternoon for eight sects of the Autobahn in Lower Austria. In the second season, forecasts were made four times a day, at 6 AM, 11 AM, 3 PM, and 10 PM for 27 sectors of road including Burgenland. The forecasts of precipitation in the first season were correct 88% of the time and none of the eight sectors were correct less than 83% of the time. The first large-scale testing has shown that the available network of stations feeding weather information back from the Autobahn ministry is still not always ideal for the different regions. The network of stations must be expanded with more tightly packed stations over a larger area and more frequent measurements. Also, more accurate data should be obtained on the temperature of road surfaces, especially bridges, moisture on road surfaces, and ground winds. (King-PTT)

Descriptors: *Evapotranspiration, *Irrigation effects, *Rapeseed, *Root development, *Soil-water-plant relationships, *Water use efficiency, India, Irrigation requirements, Plant growth, Plant physiology, Plant water potential, Soil types.

A field experiment was conducted on sandy loam soil at Hisar, India, during the autumn seasons 1984 to 1985 and 1985 to 1986 to study rape genotypes under varying irrigation schedules. Root volume and dry weight increased, while tap root and lateral root lengths decreased with irrigation. Increased irrigation frequency increased evapotranspiration but decreased water use efficiency. The relative water content and osmotic potential of the leaves increased with more frequent irrigation, but plant water retention capacity decreased. There were genotypic differences between the characters examined. Out of the five genotypes examined (Sangam, T-9, B-54, TH-72, and TH-84), genotypes T-9 and Sangam are recommended for use with irrigation and B-54 for use under unirrigated conditions. Dendochronological techniques were used to develop a history of flood occurrence and relative stage for the middle section of the Morice River based on flood scars, bank undercutting dates and tree establishment dates on fluvial features. Thirty-one significant floods over the past 105 years were detected through dendochronology of flood scarred trees. On the Morice River, flood scars are predominantly caused by flood-transported logs. Abundant log transport results in damage to channel margin trees during events only slightly above bankfull discharge. The record of flood scars on channel margin trees and establishment dates of forest stands on abandoned channels and surfaces show that the Morice River has maintained its present regimen for the past 115 years. During the Neoglacial age the Morice river was more active than in recent times, and its channels occupied twice the present area. Tree-establishment dates show that Neoglacial surfaces and channels of the Morice River were abandoned during the 1820's. The modern floodplain configuration was assumed by 1870. (Lantz-PTT)

DETERMINATION OF DESIGNATED FLOODWAY BOUNDARIES AROUND LONG ISLANDS IN STREAM CHANNELS.
Oklahoma Univ., Norman. School of Civil Engineering and Environmental Science.
J. F. Harp.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 217-223, 2 fig, 3 ref.

Descriptors: *Backwater analysis, *Channels, *Computer programs, *Data interpretation, *Flood routing, *Flow around objects, *Islands, *River flow, Flood flow, Flow profiles.

Whenever river islands are encountered in hydraulic analysis, special problems exist with respect to the proper application of most backwater package programs. This problem is due to flow divisions in the side channels that must remain constant, unless there are provisions for short circuiting the flows along the riverine pathway. The correct solution is achieved whenever the flows divide so that the head loss around each side-channel is the same. The correct flow division, and resulting backwater profile is achievable using the HEC-2 computer program. However, even with the computer assist, a trial and error procedure is required. This procedure utilizes one of three methods: (1) utilizes a large cross-section containing all the GR points, and a usual application of HEC-2 methodology; (2) assumes that the original flow ratio division remains constant, and two runs are made around the island using the tributary option and the preserved energy gradient; and (3) where smooth encroachment stations are set at outer reasonable delineations, and the side channel flows are rebalanced until equal head losses again occur around each side channel, while the incremented water surface is achieved. Descriptors: *Coastal waters, *Flood routing, *Gulf of Mexico, *Storm runoff, *Urban hydrology, *Urban runoff, Bayous, Flood control, Flood flow, Urban areas, Water management, Wetlands.

Low elevation urban centers along the coast of the Gulf of Mexico require special flood control measures to provide adequate drainage. Of particular concern to the drainage engineer are the flat slopes of the land surface and channels with usual grades of 0.0002 to 0.0005 feet/foot. Flood flow modeling and routing of stormwater where bayou thalwegs may range from -5 to 10 feet below mid sea level (msl) are described at Beaumont, Texas. Plans for a mid-city interceptor channel are described which provide downstream bayou flood relief. Another potential southern interceptor channel would provide not only additional downstream bayou flood relief, but water quality improvement to the stormwater runoff as well. Information is gained from an investigation of runoff in a southern coastal city. The techniques investigated may prove useful in other locations as well. (See also W91-01188) (Lantz-PTT)

Descriptors: *Forest ecosystems, *Land use, *Model studies, *Stream ecology, *Temperature effects, *Wales, *Water temperature, Aquatic insects, Fish populations, Growth, Mayflies, Moors, Stoneflies, Trout.

Daily temperature data from six streams in upland Wales were used to explore the thermal effects of afforestation on stream ecology. The data were linked to published biological models to simulate fish and invertebrate development. Mean daily temperatures in forest streams were lower than those of moorland streams in spring and summer, and higher in winter. These spatial comparisons were supported by the results of experimental bank-side clearance at a forest site, where there was evidence that stream temperatures fell in winter and rose in spring following treatment. Simulations indicated that brown trout (Salmo trutta) could weigh over 30% more by the end of their second growing season in a moorland compared with a forest stream. Several species of insects showed slower simulated egg development at forest sites. For two ephemeropteran species simulated nymphal growth was also retarded, suggesting significant alterations to the life cycle. Two plecopteran species were affected only slightly by the different temperature regimes. The simulations suggested that afforestation, by reducing summer temperatures, could lead to marked reductions in rates of development of some invertebrates and fish. (Author's abstract)

Descriptors: *Australia, *Intermittent streams, *Multivariate analysis, *Physicochemical properties, *Stream ecology, Conductivity, Dissolved oxygen, Flow characteristics, Flow velocity, Macroinvertebrates, Pools, Riffles, Temperature.

Amplitudes in physicochemical features in intermittent streams exceed those in nearby permanent streams and strongly influence macroinvertebrate community structure; however, this relationship has not been objectively described. Therefore, multivariate techniques of ordination and classification were applied to environmental data collected from pools and riffles at four sites on two intermittent streams in central Victoria, Australia, during a drought year followed by a wetter year. A cyclical sequence of flow phases was usually evident in pool and riffle habitats at all sites over both years: pre-flow, early flow, main flow, diminishing flow and post-flow. Several spates that occurred during the sampling period only briefly distorted the cyclical pattern. No single variable characterized these phases at each site; instead, the phases represented complex combinations of discharge, current velocity, dissolved oxygen, conductivity, water temperature and time-related variables. This highlights the advantages of an integrative, multivariate approach to seek patterns in environmental data, especially since physicochemical features are often highly inter-correlated. Although the temporal variation in most of the physicochemical variables at each site over both years was generally consistent, some differences could be ascribed to the low rainfall and discharges during the 1982 drought. Water temperature in the riffles closely reflected ambient air temperature, conductivity was usually greater, and dissolved oxygen seldom reached saturation, even in the riffles during the drought. During the wetter years after the 1982 drought, flow continued during summer at the study sites. Multivariate analyses indicated that a complete cycle in which the diminishing flow phase merged into the preflow phase would result. This is probably the usual situation in permanent streams in Australia. (White-Reimer-PTT)

This study examines the sources of interannual variability in salinity on the Newfoundland continental shelf observed in a 40-year time series from an oceanographic station known as Station 27. Specifically, through lag-correlation analysis, the a priori hypotheses that the salinity anomalies at Station 27 are determined by freshwater runoff anomalies from Hudson and Ungava Bays and by ice-melt anomalies in Hudson Bay and on the Labrador Shelf were investigated. Interannual variations of summer runoff into Hudson Bay were significantly negatively correlated with salinity anomalies on the Newfoundland Shelf with a lag (9 months) that is consistent with expected travel times based on known current velocities in Hudson Bay and along the Labrador Shelf. Sea-ice extent over the Labrador and northern Newfoundland shelves was significantly negatively correlated with salinity at a lag of 3 to 4 months, corresponding to the time of minimum salinity at Station 27. It appears that ice-melt over the Labrador-northern Newfoundland Shelf is primarily responsible for the seasonal salinity minimum over the Newfoundland Shelf. Interannual variability in runoff into Ungava Bay and ice-melt in Hudson Bay were not correlated with interannual salinity variations on the Newfoundland Shelf. (Author's abstract)

Descriptors: *Hydrologic models, *India, *Model studies, *Stochastic hydrology, *Streamflow forecasting, *Time series analysis, Case studies, Cauvery River, Data interpretation, Hemavathy River, Malaprabha River, Regression analysis, Streamflow, Water resources data.

The development and use of stochastic models of hydrological phenomena play an important role in water resources engineering, including their use to forecast river flows. The problem of model selection is an important one in time series analysis as there are an infinite number of possible models, and the choice of a wrong model may result in a costly decision. Out of the possible models of the Auto-Regressive Moving Average (ARMA) however, only a few need to be considered for modeling a given streamflow sequence. AR parameters of up to order 6 and MA parameters of up to order 2 would, in general, serve the purpose. Ten candidate models of the ARMA family (AR(1), AR(2), ..., AR(6), ARMA(1,1), ARMA(2,1), ARMA(3,1), ARMA(1,2) and ARMA(2,2)) were investigated for representing and forecasting monthly and ten-day streamflow in three Indian rivers. The best models for forecasting and data representation were selected using the criteria of Minimum Mean Square Error (MMSE) and Maximum Likelihood (ML). The selected models were validated for significance of the residual mean, significance of the periodicities in the residuals, and significance of the correlation in the residuals. The models selected, based on the ML criterion for the synthetic generation of the three monthly series are: AR(4) for the Cauvery River; ARMA(2,1) for the Hemavathy River; and ARMA(3,1) for the Malaprabha River. For the ten-day series of the Malaprabha River, the AR(4) model was selected. The AR(1) model resulted in a minimum mean square error in all the cases studied, and was recommended for use in forecasting flows one time step ahead. (Fish-PTT)

THEORETICAL MODEL OF OPTIMAL DRAINAGE NETWORKS.
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
A. D. Howard.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2107-2117, September 1990. 6 fig, 1 tab, 48 ref.

Descriptors: *Catchment areas, *Drainage patterns, *Geomorphology, *Model studies, *Stream erosion, Channel morphology, Erosion, Stochastic models, Streamflow, Valleys.

A simulation model of drainage network optimization has been developed in which channels shift to minimize total stream power within the network. The simulation model starts from an arbitrary initial stream network developed on a square matrix, such as produced by random headward growth. Discrete stream capture is then simulated within the network, occurring wherever a new stream linkage would produce a steeper course than the original. Such capture produced a network with minimum power optimization but flow directions constrained to eight directions. Individual segment end points are allowed to migrate by iterative relaxation with a direction and rapidity of motion governed by the gradient of stream power at the node. This valley migration is subject to the constraint that the sources and outlet remain fixed. The resulting networks are visually and morphometrically more similar to natural stream networks than the original networks produced by the random headward growth model. (Author's abstract)

PRACTICAL ASPECTS OF LOW-FLOW FREQUENCY ANALYSIS.
Melbourne Univ., Parkville (Australia). Dept. of Civil and Agricultural Engineering.
R. J. Nathan, and T. A. McMahon.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2135-2141, September 1990. 3 fig, 5 tab, 24 ref.

Descriptors: *Drought, *Flow equations, *Frequency analysis, *Low flow, Forecasting, Mathematical analysis, Streamflow, Streamflow data.

Some practical aspects concerning the application of the Weibull distribution to low-flow frequency analysis were examined. Two-parameter and three-parameter forms of the distribution were fitted to a total of 987 distributions derived from the daily flow data of 134 catchments located in southeastern Australia. The relative performance of three estimation methods (moments, maximum likelihood, and probability weighted moments) was investigated, and it is found that the different estimation methods provide distinct sets of quantile estimates. The method of probability weighted moments is more likely to give unsatisfactory estimates of the smallest drought and in general tends to yield less severe estimates of drought volumes relative to the other two methods. The method of maximum likelihood occasionally provides estimates of drought volumes that are many times

LIBRARY U. S. GEOLOGICAL SURVEY RESTON, VIRGINIA

greater than that yielded by the methods moments or probability weighted moments. The differences between low-flow frequency estimates based on calendar and hydrologic years were also investigated. Low-flow frequency estimates based on calendar years overestimate low-flow volumes for durations of 3 mo and more, whereas the opposite effect is apparent for shorter durations. It is evident that drought estimates should be based on the hydrologic year, regardless of the duration considered. (Peters-PTT)

FLOOD OF OCTOBER 1983 AND HISTORY OF FLOODING ALONG THE SAN FRANCISCO RIVER, CLIFTON, ARIZONA.
Geological Survey, Tucson, AZ. Water Resources Div.
H. W. Hjalmarson.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 85-4225-B, 1990. 42p, 31 fig, 6 tab, 11 ref.

Descriptors: *Arizona, *Flood frequency, *Flood peak, *San Francisco River, Blue River, Clifton.

Clifton, Arizona, has received major damage from floods at least 12 times since the town was settled in 1870. Residents built floodwalls along the main channel of the San Francisco River, filled in floodplain areas, and raised buildings and roads in an effort to protect homes and businesses. Although the floodwalls provide protection during low and medium flows, they provide little protection during large flows. During the flood of October 1 and 2, 1983, floodwaters overtopped the floodwalls and inundated flood plains. The 2,766-square-mile basin of the San Francisco River is steep and has a large topographic relief, especially near Clifton. Intense orographic rainfall from winter storms results in rapid runoff in the San Francisco River basin. Flood routing and hydrograph analyses indicate that runoff from the southern part of the San Francisco River basin produced many large flood peaks at Clifton. (USGS)

MINIMUM FROUDE NUMBER AND THE EQUILIBRIUM OF ALLUVIAL SAND RIVERS.
Victoria Univ. of Manchester (England). Dept. of Geography.
Y. Jia.
Earth Surface Processes and Landforms ESPLDB,

Vol. 15, No. 3, p 199-209, May 1990. 8 Fig, 28 Ref.

Descriptors: *Alluvial rivers, *Channel morphology, *Equilibrium, *Flow, *Froude number, *Geomorphology, *Model studies, *River flow, *Sediment load, *Sediment transport, Channel flow, Channel stability, Channels, Computer models, Flow velocity, Hydraulic geometry, Particle size, Sand, Sedimentation, Simulation.

Rivers adjust towards an equilibrium condition, the stability of which depends on a set of controlling factors expressed by the Froude number. As alluvial river channels approach stable conditions, the Froude number of the channel flow will tend to attain a minimum value which reflects minimum bed material motion and maximum channel stability, under the constraints imposed by water discharge, sediment load, and particle size. Computer simulations for sand bed rivers show that the Froude number of the flow tends to a minimum value when the equilibrium river tends to a certain hydraulic geometry. Evidence from 57 alluvial sand material rivers and stable channels shows that this simulated hydraulic geometry with minimum Froude number corresponds to the natural equilibrium state. The results from these simulations may be used in designing stable channels or judging the stability of alluvial channels. (Author's abstract)

The Siret River has the largest drainage basin in Romania. It gathers all the rivers from the eastern part of the Eastern Carpathians, which causes marked asymmetry of the basin. Changes in the form of the longitudinal profile and the grain size variability introduced by the Carpathian tributaries were examined. Channel sediment analyses considered the petrography, granulometry, and morphometry of the pebbles, relating these to the river bed and floodplain geometry and to some properties of the drainage basin. It was determined that the Siret River undergoes an intense regrading of its longitudinal profile, with marked aggradation between transects 24 and 26. This reflects selective accumulation of coarse material due to the massive contribution of the Carpathian tributaries. It is hypothesized that the deformation results from the failure of the river to reduce its bed elevation in its middle-lower reach to the theoretical equilibrium profile which causes the river not to attain the state of grade. This phenomenon has been continuous throughout the Holocene, resulting in the gravel sheet formation of the Pericarpathian piedmont. (Author's abstract)

CHANNEL AVULSION AND RIVER METAMORPHOSIS: THE CASE OF THE THOMSON RIVER, VICTORIA, AUSTRALIA.
Melbourne Univ., Parkville (Australia). Dept. of Geography.
S. O. Brizga, and B. L. Finlayson.
Earth Surface Processes and Landforms ESPLDB, Vol. 15, No. 5, p 391-404, August 1990. 9 fig, 2 tab, 26 ref.

Descriptors: *Avulsion, *Channel morphology, *Channels, *Floodwater, *Geomorphology, *Meanders, *Paleohydrology, *Rivers, Alluvial channels, Australia, Flood plains, Hydrology, Thomson River, Victoria.

Channel avulsion occurred on the Thomson River in Victoria, Australia, in 1952 along a 12 km length of the valley. A comparison of the old and new channels reveals considerable differences in channel characteristics. The old channel was perched above the floodplain on an alluvial ridge and when bankfull capacity was exceeded, floodwaters concentrated on the lowest part of the floodplain some distance away. This is where the new channel formed. It is an incised channel with larger capacity and longer meander wavelength than the old channel and is also shorter and steeper. The new channel is subject to larger floodflows and a more variable flood regime than the old course because of the differences in the channel/floodplain relationship and channel capacity. The resulting concentration of stream power along the new course is responsible for the contrast in channel characteristics and for the more rapid meander migration. This example shows that river metamorphosis can occur without major environmental changes. Measures of channel geometry such as gradient, sinuosity, and meander wavelength cannot be used in palaeohydrological work to infer climatic or other environmental changes without independent supporting evidence. Differences in channel geometry can arise simply from changes in the relationship between the channel and its floodplain. (Author's abstract)

Federal groundwater policy has provided the states with incomplete guidance since it was first patched together six years ago. When the EPA started to formulate its policy in the early 1980s, it realized that none of the nine major federal environmental laws gave the agency comprehensive authority over national groundwater resources. The EPA has now proposed that protecting uncontaminated groundwater requires a different approach than one for remediating polluted aquifers. The new policy is presented in two documents: 'EPA Statement of Groundwater Principles' and 'State/Federal Relationships Options Paper, EPA Ground-Water Task Force.' While the EPA is moving away from permitting degradation either to maximum contaminant levels (MCL) or maximum contaminant level goal levels, unfortunately its new policy retains former, less strict standard in making decisions on remediating already contaminated supplies. Once adopted under Superfund and Resource Conservation and Recovery Act (RCRA), MCLs and other cleanup standards constitute not only the levels that will be deemed acceptable for cleanup, but also the limit of liability for cleanup for the persons who are responsible for creating the environmental problem. In actuality, EPA reconciles the inherent conflict between large remedy costs and cleanup standards by minimizing costs and setting standards in individual cases in a way that structures the responsible parties' liability at a level that has already taken the cost to them into consideration. By trying to place protection on an equal footing with remediation, the two recent EPA documents present a shift in how the agency presents its groundwater policy, and seem to send a message to the states that groundwater protection efforts should not rely on MCLs as a degradation ceiling. LIBRARY U. OF I. URBANA CHAMPAIGN

Radon, Salinity, Sorption, Transport, Water quality.

Distinctions are made among single-, two-, and three-phase systems in this review. Single-phase systems refer to groundwater systems subjected to saturated flow conditions, whereas the two-phase and three-phase systems include groundwater systems subjected to unsaturated flow conditions, or conditions influenced by immiscible organic fluids such as petroleum products. Within the single-, two-, and three-phase system categories. Subdivisions are made among physical, chemical, or biological processes such as hydrodynamics, sorption/desorption, chemical reactions, and biodegradation. Specialized areas such as radon and radionuclide transport, facilitated transport, and saline groundwaters also are treated separately. The Rounding out this year's review, papers concerning groundwater quality monitoring, remediation, and management are discussed. (Author's abstract)

Descriptors: *Capillary capacity, *Groundwater movement, *Hydraulic conductivity, *Mathematical equations, *Saturated flow, *Soil water, *Unsaturated flow, Capillary conductivity, Capillary water, Mathematical studies, Model studies.

A simple closed form equation for saturated hydraulic conductivity, has been derived using the statistical pore structure model of Maulem with van Genuchten's capillary retention relationship. Application of this equation to an experimental data set shows reasonable mean agreement between measured and predicted saturated conductivities with approximately order-of-magnitude precision in predictions. Equations which are presented provide a consistent theoretical basis for estimating both saturated and unsaturated conductivities from capillary retention characteristics, and should be useful as predictive tools in the absence of actual conductivity measurements. As such, these equations are an alternative to purely statistical models which relate soil texture to hydraulic properties. The proposed procedure should be applicable in estimating saturated/unsaturated conductivity from capillary retention characteristics when moisture retention curve and the retention parameters are indirectly generated from particle size distribution data. Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 9, p 1145-1156, September 1990. 5 fig, 1 tab, 7 ref, append.

Descriptors: *Aquifer characteristics, *Aquifer testing, *Flow models, *Groundwater movement, *Model studies, *Pumping tests, Drawdown, Flow equations, Hydrological regime, Nonlinear programming, Transmissivity, Turbulent flow.

Type curves for the general nonlinear flow based on the exponential flow law were derived with the application of the Boltzmann transformation to the groundwater continuity and flow-law equations. The initial and moderate portions of these curves are very significant for the estimation of aquifer parameters. Recently, nonlinear flow-type straight-line expressions were derived on the basis of exponential flow law instead of the linear Darcy law. A procedure of hypothesis testing for the flow-regime linearity has been developed. Using this procedure, it was concluded that any straight line for late time-drawdown data on semilogarithmic paper does not necessarily guarantee the accurate application of the classical Jacob methods, but confirms the flow is radial. A dimensionless time-drawdown plot should be used for the identification of flow regime. If the dimensionless time-drawdown plot for the late time-drawdown data fits a straight line with the same slope as the Jacob straight line, then the underlying flow regime is linear. Otherwise, the flow regime is nonlinear. Once the flow regime is nonlinear, the necessary equations should be applied for the estimation of parameters such as the storability, turbulence exponent, and transmissivity. The methodology has been applied successfully to field data. (Author's abstract)

TWO-PHASE RELATIVE PERMEABILITY AND CAPILLARY PRESSURE OF ROUGH-WALLED ROCK FRACTURES.
Lawrence Berkeley Lab., CA. Earth Sciences Div.
K. Pruess, and Y. W. Tsang.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1915-1926, September 1990. 9 fig, 52 ref.
DOE Contract DE-AC03-76SF00098.

Descriptors: *Fracture permeability, *Geologic fractures, *Groundwater movement, *Model studies, *Multiphase flow, Capillarity, Permeability, Rock properties, Wetting.

A conceptual and numerical model of multiphase flow in fractures has been developed. The void space of real rough-walled rock fractures is conceptualized as a two-dimensional heterogeneous porous medium, characterized by aperture as a function of position in the fracture plane. Portions of a fracture are occupied by wetting and nonwetting phase, respectively, according to local capillary pressure and global accessibility criteria. Phase occupancy and permeability are derived by assuming a parallel-plate approximation for suitably small subregions in the fracture plane. For log normal aperture distributions, a simple approximation to fracture capillary pressure is obtained in closed form; it resembles the typical shape of Leverett's j function. Approximations to wetting and nonwetting phase relative permeabilities are calculated by numerically simulating single phase flows separately in the wetted and nonwetted pore spaces. Illustrative examples indicate that relative permeabilities depend on the nature and range of spatial correlation between apertures. It was also observed that interference between fluid phases flowing in a fracture tends to be strong, with the

sum of wetting and nonwetting phase relative permeabilities being considerably less than 1 at intermediate saturations. (Author's abstract)
W91-01511

INTERBED STORAGE CHANGES AND COMPACTION IN MODELS OF REGIONAL GROUNDWATER FLOW.
Geological Survey, Tucson, AZ.
S. A. Leake.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1939-1950, September 1990. 8 fig, 1 tab, 32 ref.

Descriptors: *Compaction, *Groundwater movement, *Land subsidence, *Model studies, *Pumping head, *Storage coefficient, *Subsidence, California, Confined aquifers, Flow models, Groundwater storage, Mathematical models, Pumping, Storage equation.

Water released from permanent compaction of compressible fine-grained interbeds within confined aquifers may be a significant source of pumped water. Permanent or inelastic compaction of the interbeds occurs when head declines from pumping cause the effective stress or grain-to-grain load to exceed the elastic limits of the interbeds. As a result, the grains in the interbeds rearrange and excess water is expelled. The amount of inelastic compaction generally is proportional to the increase in effective stress and the decrease in head. A common approach for the simulation of elastic and inelastic compaction in groundwater flow models is to assume that head changes in the aquifer result in instantaneous storage changes in the compressible interbeds. A term is added to the groundwater flow equation to account for the storage changes. Changes in specific storage may be computed explicitly from the results at the previous time step in the finite difference formulation of the groundwater flow equation. A better approach is to implicitly apportion storage changes between elastic and inelastic components within a time step. If storage changes cannot be considered to occur instantaneously with change in head in the aquifer, another approach is taken. Equations for horizontal flow in the aquifer are coupled with equations for vertical flow in the compressible interbeds to simulate flow in half a representative doubly draining interbed. Storage changes and compaction are calculated for the representative half thickness and are extrapolated to the entire thickness of all interbeds within each cell. This approach was applied to an existing model of groundwater flow in the Central Valley of California. The simulation demonstrated that solving coupled systems of equations is feasible for a regional flow model. (Author's abstract)

SOLVING GROUNDWATER FLOW PROBLEMS BY CONJUGATE-GRADIENT METHODS AND THE STRONGLY IMPLICIT PROCEDURE.
Geological Survey, Lakewood, CO.
M. C. Hill.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1961-1969, September 1990. 1 fig, 2 tab, 33 ref.

Descriptors: *Computer models, *Flow models, *Groundwater movement, *Model studies, Computers.

The performance of the preconditioned conjugate-gradient method with three preconditioners for solving groundwater flow problems was compared with the strongly implicit procedure (SIP) using a scalar computer. The preconditioners considered are the incomplete Cholesky (ICCG) and the modified incomplete Cholesky (MICCG), which require the same computer storage as SIP as programmed for a problem with a symmetric matrix, and a polynomial preconditioner (POLCG), which requires less computer storage than SIP. Although POLCG is usually used on vector computers, it was included because of its small storage requirements. Published comparisons of the solvers were evaluated, all four solvers were compared for the first time, and new test cases were examined to provide a more complete basis by which the solvers can be judged for typical groundwater flow problems. Based on nine test cases, the following conclusions were reached: (1) SIP is actually as efficient as ICCG for some of the published, linear, two-dimensional test cases that were reportedly solved much more efficiently by ICCG; (2) SIP is more efficient than other published comparisons would indicate when common convergence criteria are used; and (3) for problems that are three-dimensional, nonlinear, or both, and for which common convergence criteria are used, SIP is often more efficient than ICCG, and is sometimes more efficient than MICCG. STREAM FUNCTIONS AND EQUIVALENT FRESHWATER HEADS FOR MODELING REGIONAL FLOW OF VARIABLE-DENSITY GROUNDWATER. 1. REVIEW OF THEORY AND VERIFICATION.
Texas Univ. at Austin. Bureau of Economic Geology.
R. K. Senger, and G. E. Fogg.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2089-2096, September 1990. 6 fig, 25 ref.

Descriptors: *Flow equations, *Geohydrology, *Groundwater movement, *Model studies, *Path of pollutants, *Saline water intrusion, Boundary conditions, Confined aquifers, Errors, Hydraulic gradient, Mathematical models, Variable density.

Steady state flow of variable-density groundwater was simulated using equivalent freshwater heads and stream functions. On the basis of previously published work, fluids with different fluid densities are replaced by one hypothetical fluid, and singularities are introduced along interfaces where the actual fluids change densities. The basic flow equation describing variable-density flow, written in terms of equivalent freshwater head, was used to derive the corresponding stream function equation and associated boundary conditions. Neumann boundary conditions for the stream function equation can be determined from gradients of equivalent freshwater heads along the boundary. Stream functions provide a direct representation of the groundwater flow pattern and flow rates where fluid densities vary in space. In comparison, equivalent freshwater heads and fluid densities describe the two driving forces, hydraulic gradient and buoyancy force, but head gradients do not necessarily describe the flow direction of variable-density groundwater in isotropic media. Comparison of the finite element formulations indicated that potential errors in the centroid-consistent velocity calculation based on the stream function solution can be expected to be smaller than those in the velocity calculation based on the head solution for cross-sectional flow models, because discretization in the vertical direction is typically finer than in the horizontal direction. The approach of using stream functions and equivalent freshwater head for simulating groundwater flow of variable density fluid is demonstrated using a cross-sectional study of seawater intrusion into a confined aquifer as an example. (See also W91-01525) (Author's abstract)

STREAM FUNCTIONS AND EQUIVALENT FRESHWATER HEADS FOR MODELING REGIONAL FLOW OF VARIABLE-DENSITY GROUNDWATER. 2. APPLICATION AND IMPLICATIONS FOR MODELING STRATEGY.
Texas Univ. at Austin. Bureau of Economic Geology.
R. K. Senger, and G. E. Fogg.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2097-2106, September 1990. 7 fig, 1 tab, 25 ref.

Descriptors: *Convection, *Flow models, *Geohydrology, *Groundwater movement, *Model studies, *Path of pollutants, *Surface-groundwater relations, Boundary conditions, Brines, Hydraulic properties, Saline water, Uncertainty.

Stream functions and equivalent freshwater heads were used to simulate steady state flow of variable-density groundwater in a regional, cross-sectional flow model through the Palo Duro Basin, Texas, where fluid densities vary between 1.0 and 1.15 g/cu cm. Centroid-consistent velocities computed from the stream function solution allow a more precise interpretation of local flow patterns in cross-sectional models than those from the head solution. Effects of significant fluid density variation on the regional groundwater flow pattern were studied by comparing simulation results that incorporate spatially varying, time-invariant densities with those that assume uniform density. Modeling shows that the regional groundwater flow pattern in the Palo Duro Basin is not significantly affected by variations in fluid densities, indicating that the topographically driven flow component dominates buoyancy forces associated with dense brines. An exception is near the eastern boundary where high fluid densities cause stronger downward flow. However, simulated equivalent freshwater heads in the variable-density model differ significantly from simulated heads in the freshwater density model, which is important for model calibration. In addition to the problems of hydraulic parameter and boundary condition uncertainties, modeling strategies for regional flow systems require consideration of uncertainties associated with fluid density and evaluation of equivalent freshwater head data. TIDAL DYNAMICS OF THE WATER TABLE IN BEACHES.
Sydney Univ. (Australia). Ocean Technology Group.
P. Nielsen.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2127-2134, September 1990. 8 fig, 2 tab, 10 ref.

Descriptors: *Beaches, *Model studies, *Surface-groundwater relations, *Tidal effects, *Water level, *Water table, Boundary conditions, Field tests, Mathematical models, Slopes, Tides.

Tidal motions of the water table height inside a sloping beach were investigated via field measurements and theoretical considerations. Only the movements forced by the tide were considered, so a beach with negligible wave activity was chosen for the field measurements. The data show that even in the absence of precipitation the time averaged inland water table stands considerably above the mean sea level. Also the water table at a fixed point inside the beach is far from sinusoidal even though its variation is forced by an essentially sinusoidal tide. This effect is due to the boundary condition along the sloping beach face which acts as a highly nonlinear filter. The observed behavior of the water table is explained in terms of perturbation extensions to the classical 'deep aquifer solution'. One extension deals with the nonlinearity in the interior, the other with the boundary condition at the sloping beach face. (Author's abstract)

Water Resources Research WRERAQ, Vol. 26, No. 9, p 2153-2159, September 1990. 7 fig, 2 tab, 23 ref. USGS Grant 14-08-0001-G1136.

Descriptors: *Artificial recharge, *Biofilms, *Clogging, *Injection wells, *Permeability, *Physical properties, *Porous media, Bacteria, Biomass, Experimental data, Laboratory methods, Model studies, Piezometric head, Plugging.

An experimental investigation was conducted to quantify the permeability reduction caused by enhanced biological growth in a porous medium. Studies were conducted using sand-packed column reactors for which variations in piezometric head, substrate concentration, and biomass measured as organic carbon were monitored in space and time. Methanol was used as a growth substrate. Permeability reductions by factors of order 0.001 were observed. The data show that a limit on permeability reduction exists, having a magnitude of 0.0005 in the present study. The limit on permeability reduction and existence of high densities of bacteria in substrate depleted zones are explained with an open pore model. Permeability reduction correlated well with biomass density for values less than 0.4 mg/cu cm, and exhibited independence at higher densities. (See also W91-01532 and W91-01533) (Author's abstract)

BIOFILM GROWTH AND THE RELATED CHANGES IN THE PHYSICAL PROPERTIES OF A POROUS MEDIUM. 2. PERMEABILITY.
Princeton Univ., NJ. Dept. of Civil Engineering and Operations Research.
S. W. Taylor, P. C. D. Milly, and P. R. Jaffe.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2161-2169, September 1990. 10 fig, 17 ref. USGS Grant 14-08-0001-G1136.

Descriptors: *Artificial recharge, *Biofilms, *Clogging, *Injection wells, *Model studies, *Permeability, *Porous media, Biomass, Comparison studies, Mathematical models, Physical properties, Porosity.

Growth of a biofilm in a porous medium reduces the total volume and the average size of the pores. The change in the pore size distributions is easily quantified when certain geometric assumptions are made. Existing models of permeability or of relative permeability can be manipulated to yield estimates of the resulting reduction in permeability as a function of biofilm thickness. The associated reductions in porosity and specific surface can be estimated as well. Based on a sphere model of the medium, the Kozeny-Carman permeability model predicts physically realistic results for this problem. Using a cut-and-random-rejoin-type model of the medium, the permeability model of Childs and Collis-George yields qualitatively reasonable results for this problem, as does a generalization of the relative permeability model of Mualem. Permeability models of Kozeny-Carman and of Millington and Quirk lead to unrealistic results for a cut-and-random-rejoin-type medium. The Childs and Collis-George and the Mualem models predict that the permeability reduction for a given volume of biomass is greatest when the porous medium has uniform pore sizes. BIOFILM GROWTH AND THE RELATED CHANGES IN THE PHYSICAL PROPERTIES OF A POROUS MEDIUM. 3. DISPERSIVITY AND MODEL VERIFICATION.
Princeton Univ., NJ. Dept. of Civil Engineering and Operations Research.
S. W. Taylor, and P. R. Jaffe.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2171-2180, September 1990. 9 fig, 3 tab, 26 ref. USGS Grant 14-08-0001-G1136.

Descriptors: *Artificial recharge, *Biofilms, *Clogging, *Dispersivity, *Injection wells, *Model studies, *Physical properties, *Porous media, Experimental data, Least squares method, Mathematical models, Permeability, Porosity, Solute transport, Tracers.

The change in dispersivity resulting from the growth of a biofilm in a porous medium was derived from an existing model of dispersivity and a cut-and-random-rejoin-type model of the pore geometry. The change in dispersivity due to a biofilm was also estimated from experimental data. Tracer experiments were conducted in biofilm column reactors and dispersion coefficients estimated by solving the inverse solute transport problem by nonlinear, least squares regression. Due to the presence of the biofilm in the porous media, solute flux into the biofilm is an important transport process and was given special attention. Both the dispersivity model and experimentally estimated dispersivities show order of magnitude increases in dispersivity as a result of significant biofilm growth. The models for the biofilm-affected permeability, porosity, and specific surface derived in a companion paper were verified using data from biofilm column reactors. These models were used to determine parameters for an equation describing the transport of substrate in the experimental columns. Numerical simulations were performed and compared to observed substrate data. Results show that the models for permeability and porosity can be used to make estimates of these parameters, while the model for specific surface appears to be inadequate. SUBSTRATE AND BIOMASS TRANSPORT IN A POROUS MEDIUM.
State Univ. of New York at Buffalo. Dept. of Civil Engineering.
S. W. Taylor, and P. R. Jaffe.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2181-2194, September 1990. 12 fig, 1 tab, 33 ref.

Descriptors: *Aquifers, *Artificial recharge, *Bacteria, *Biofilms, *Biomass, *Clogging, *Injection wells, *Model studies, *Porous media, *Solute transport, Dispersivity, Finite element method, Groundwater recharge, Mathematical models, Permeability, Porosity, Pumping rates.

A model describing the transport of substrate and biomass in porous media was formulated which accounts for the transport, growth and decay of biomass suspended in the water phase and attached to the solid matrix as a biofilm. Interphase transport of biomass between the water phase and attached biofilm phase due to fluid mechanical shear and filtration was also considered. Special attention is given to changes in the porosity, permeability, and dispersivity resulting from the biofilm altering the microscopic geometry of the pore space. A numerical solution to the governing equations was obtained by the finite element method. The model was calibrated and verified against experimental data. The model was applied to the problem of aquifer clogging during the injection of water containing a growth-limiting substrate to assess the effects of pulsed substrate loading, flow rate, and flow duration on the clogging of porous media by biomass. Results from numerical experiments conducted with the model suggest the following: (1) Pulsed substrate loading does little to mitigate aquifer clogging for one-dimensional flow, but for radial flow from an injection well source, pulsing is expected to result in significantly less clogging. (2) Reduced substrate loading and increased pumping duration minimizes aquifer clogging. (3) Reduced substrate loading and increased pumping rate is most effective in minimizing aquifer clogging. Descriptors: *Geohydrology, *Groundwater basins, *Groundwater movement, *Groundwater recharge, Andes Mountains, Chile, Geologic fractures, Groundwater dating, Saline groundwater.

Isotopic, chemical and geologic evidence and temperature measurements support the hypothesis of a regional ground-water flow system in the Pampa del Tamarugal, Chile, basin associated with recharge areas located in the higher part of the Andes region. The discharge of this flow system should occur as fracture flow and or flow through the volcanic units and is suspected to be along faults situated at the foothills of the Andes and in the desert belt along the central valley. Some of the groundwaters located in the Pica and Canchones area are pre-Holocene in age, but most of the groundwaters located in the central part of the basin are younger and recharged during the Holocene. (14)C measurements in dissolved inorganic carbon were used to estimate groundwater residence times. Generally, the electric conductivity values increas from the eastern to the western part of the basin. Groundwater temperature distribution also identified the circulation of deep groundwater. A practical procedure was evaluated for acquisition and representation of electrical resistivity data, including a two-dimensional methodology for quantitative structural interpretation. This technique was combined with Schlumberger vertical electrical soundings(VES) and electrical well logs

for a comprehensive evaluation of the subsurface hydrological conditions of fractured crystalline aquifers of the Itabera area, Bahia state, Brazil. The apparent resistivity sections constructed from partial electrical sounding measurements taken at a closely spaced interval along a traverse were interpreted using a finite-difference algorithm. This scheme allowed detailed description of the lateral and vertical extent of fractured aquifers and some of their hydrogeophysical characteristics. The results of a case study from Bahia state compare satisfactorily with available geophysical logs and production data of existing wells. (Miller-PTT)

Four wells and six perennial springs located in The Big Bend National Park were sampled and analyzed to determine recharge sources for the springs which discharge along banks of arroyos incised in alluvial pediment lying about 900 meters below the uplands of the Chisos Mountains. The waters total dissolved solids and calcite saturation indices increase with decreasing altitude, suggesting recharge from the Chisos uplands. Temperature, dissolved oxygen, delta 018, tritium and Carbon-14 data indicate a significant recharge component to springs occurs by infiltration of infrequent precipitation falling on the arid alluvial lowlands. This water percolates through the soil zone to aquitards (essentially calcitic hardpans) which function as horizons which channel the water laterally toward discharge in springs. The springs recharge-to-discharge paths are short with flow being slow enough to reflect seasonal temperature differences of greater than 12 C, yet recent enough to contain post-bomb spikes of tritium and Carbon-14. GROUND-WATER RESOURCES OF THE ARKANSAS RIVER BASIN IN ARKANSAS.
Geological Survey, Little Rock, AR. Water Resources Div.
J. M. Kilpatrick, and A. H. Ludwig.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 88-725, 1990. 45p, 12 fig, 34 ref.

Descriptors: *Arkansas, *Geohydrology, *Groundwater, *Groundwater availability, *Groundwater resources, *Water quality, *Water resources data, Arkansas River, Water use.

The Arkansas River basin in Arkansas lies almost entirely within the Interior Highlands physiographic division. The Interior Highlands consist of hilly to mountainous terrain underlain by sandstone, shale, limestone, and dolomite. That part of the basin southeast of Little Rock lies within the Gulf Coastal Plain and is characterized by flat to hilly topography. Significant water-yielding units within the Arkansas River basin include subsurface Paleozoic units such as the Eminence and Potosi Dolomites, the Gasconade Dolomite, and the Van Buren Formations, and Roubidoux Formation as well as outcrops of Paleozoic rocks, the Sparta Sand, and Quaternary deposits. The quality of groundwater withdrawn from the various aquifers in the study area is generally suitable for most uses, although commonly very hard and highly mineralized. Only the Sparta Sand yields a soft, less mineralized water. Yields from the different water-bearing units are highly variable. Several of the subsurface Paleozoic rocks rarely yield more than 10 gal/min. In the Coastal Plain, the Sparta Sand and the Quaternary deposits yield as much as 2,000 and 2,500 gal/min, respectively. Several studies have indicated substantial bacterial contamination of both wells and springs in this part of the study area. Also, nitrate concentrations that exceed U.S. Environmental Protection Agency primary drinking water standards occur in some areas. (USGS)

GROUND-WATER FLOW IN THE GULF COAST AQUIFER SYSTEMS, SOUTH-CENTRAL UNITED STATES--A PRELIMINARY ANALYSIS.
Geological Survey, Austin, TX. Water Resources Div.
A. K. Williamson, H. F. Grubb, and J. S. Weiss.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4071, 1990. 124p, 33 fig, 5 tab, 140 ref.

Descriptors: *Groundwater, *Groundwater movement, *Hydrologic data, *Water resources data, Computer models, Gulf Coast Aquifer System, Pumpage, Recharge, Regional analysis, Simulation, Topography, Vertical flow, Water table.

A major objective of the Gulf Coast Regional Aquifer-System Analysis is to use digital models of regional groundwater flow systems to develop better understanding and to improve management of the resource. Modeling is used to synthesize information about the aquifer systems and to test hypotheses about the relative importance of the components of the systems. The 290,000-sq mile study area in the Gulf of Mexico Coastal Plain includes the Mississippi embayment, Gulf Coastal Plain of Texas, and the Continental Shelf that are underlain by deposits of Tertiary and younger age, which contain fresh and saline water. A 10-layer, finite-difference, variable density model, with blocks 10 miles on a side, was used to simulate groundwater flow before development and in 1980, assuming steady-state conditions. Preliminary results indicate that the major factors controlling predevelopment regional flow are the topography, land-surface outcrop pattern, and geometry of aquifers and confining units. Geologic structure and the distribution of precipitation were less significant factors. The density of saline water in the deeper parts of the aquifer system probably has a substantial effect on regional groundwater flow that extends into the freshwater part of the system. Variable water density may be a significant driving force that transports salt great distances in many directions, including updip. The distribution and rates of regional recharge and discharge have been substantially changed by development. Groundwater pumpage in 1980 was about five times the value of predevelopment regional recharge. About 80% of the pumpage was supplied from increased regional recharge. Also resistance to vertical flow caused by many fine-grained beds within the permeable zones can be as important as resistance caused by regional confining units. (USGS)

ASSESSMENT OF HYDROLOGIC AND HYDROGEOLOGIC DATA AT CAMP LEJEUNE MARINE CORPS BASE, NORTH CAROLINA.
Geological Survey, Raleigh, NC. Water Resources Div.
D. A. Harned, O. B. Lloyd, and M. W. Treece.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4096. 1989. 64p, 20 fig, 2 tab, 19 ref.

Descriptors: *Camp Lejeune, *Groundwater movement, *Hydrogeology, *Hydrologic data, *North Carolina, *Water level, *Water resources data, *Water use, Castle Hayne Aquifer, Coastal plains.

The U.S. Geological Survey, in cooperation with the U.S. Marine Corps, is studying the groundwater resources of the Marine Corps Base at Camp Lejeune, North Carolina, and is constructing a groundwater flow model of the area. Water use by the Base increased from about 4 million gal/day in 1941 to about 7 million gal/day in 1986. In the last decade, water demand has not increased substantially. The Castle Hayne aquifer is the source of water for the Base. The aquifer, which lies between 50 and 300 ft below the Base, is composed of a series of sand and limestone beds. Contour maps of water levels show that the New River is a major discharge area for the Castle Hayne, as is the Atlantic Ocean. The top of the aquifer ranges from about 20 ft above sea level in the northern

LIBRARY U. S. GEOLOGICAL SURVEY

part of the area to about 40 ft below sea level in the southeastern part. Thin and discontinuous clay beds, less than 30 ft thick, compose about 15% to 24% of the section, indicating that the aquifer is in a leaky, confined aquifer system. Well-acceptance tests indicate a mean specific capacity of 8.8 gal/min/ft of drawdown. The mean transmissivity value estimated from specific capacities is 9,900 sq ft/day. The mean estimated hydraulic conductivity is 48 ft/day. (USGS)

HYDROGEOLOGY OF AQUIFERS IN CRETACEOUS AND YOUNGER ROCKS IN THE VICINITY OF ONSLOW AND SOUTHERN JONES COUNTIES, NORTH CAROLINA.
Geological Survey, Raleigh, NC. Water Resources Div.
W. L. Lyke, and M. D. Winner.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4128, 1990. 49p, 12 fig, 3 tab, 21 ref.

Descriptors: *Aquifers, *Coastal plains, *Geohydrology, *Groundwater, *Hydrologic data, *North Carolina, *Water resources data, Cross-sections, Hydrogeology, Maps.

Unconsolidated sediments in Onslow and Jones Counties, North Carolina overlie crystalline basement rocks and range in thickness from about 700 ft to more than 1,800 ft, thickening toward the east. This material is composed of permeable sand and limestone interlayered with relatively impermeable clay and silt beds. Sediments are divided into two groups: aquifers in Quaternary-, and Tertiary-aged rocks and aquifers in Cretaceous-aged rocks. Aquifers in the Cretaceous rocks provide most of the groundwater for public supplies and are the focus of this report. The aquifers in Cretaceous rocks are the Peedee, Black Creek, upper Cape Fear, and lower Cape Fear aquifers, which are composed of beds or groups of beds of sand and gravel. Each aquifer is overlain by a clay and silt bed, that impedes the flow of water between aquifers. The thickness of Cretaceous hydrogeologic units ranges from about 700 ft to more than 1,300 ft. Hydrogeologic units are correlated using 60 geophysical logs and accompanying drillers' logs along with water level and water quality data. Three hydrogeologic sections demonstrate the continuity of the aquifers and confining units, show water levels and chloride concentration in water from test intervals, and delineate where chloride concentration in water exceeds 250 mg/L within each aquifer. Maps of each aquifer in Cretaceous rocks show altitude of its top, thickness, sand percentage, and the transition from freshwater to saltwater. Maps of the confining units show thickness and sand percentage of each. (USGS)

WATER RESOURCES OF CODINGTON AND GRANT COUNTIES, SOUTH DAKOTA.
Geological Survey, Huron, SD. Water Resources Div.
D. S. Hansen.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4147, 1990. 47p, 25 fig, 8 tab, 18 ref.

Descriptors: *Groundwater, *Hydrologic data, *North Dakota, *Water resources data, Bedrock aquifers, Glacial aquifers, Groundwater recharge, Water quality, Water use.

The primary sources of surface water in Codington and Grant Counties are Lakes Kampeska and Pelican and numerous potholes in western Codington County. Seasonal variations in streamflow and lake levels are directly related to seasonal variations in precipitation and evapotranspiration. Dissolved-solids concentrations in water from streams and lakes increase as stream discharge decreases and lake levels decline. Seven aquifers in glacial-outwash deposits and two bedrock aquifers were delineated in Codington and Grant Counties. The extent of the outwash aquifers ranges from 30 sq mi for the Antelope Valley aquifer to 860 sq mi for the Altamost aquifer. The average thickness of the glacial aquifers ranges from 20 ft for the Prairie Coteau to 63 ft for the Revillo. The Big Sioux and Antelope Valley aquifers are less than 10 ft below land surface. The Veblen, Prairie Coteau, and the Lonesome Lake aquifers are less than 380 ft below land surface. The Revillo and Altamost aquifers are less than 668 ft below land surface. Reported well yields are as much as 800 gal/min for the Big Sioux, Antelope Valley, and Prairie Coteau aquifers. Predominant ions are calcium and bicarbonate in water from the Big Sioux, Antelope Valley, Prairie Coteau, Veblen, Revillo, and Lonesome Lake aquifers. Sulfate also is predominant in water from the Veblen aquifer. Average dissolved-solids concentrations in water from the aquifers range 350 to 2,120 mg/L. The two bedrock aquifers delineated are the Dakota and granite wash. The water level has declined 10 ft from 1958 to 1985. Predominant ions in water from the Dakota and granite wash aquifers are sodium and sulfate. (USGS)

SIMULATION OF GROUND-WATER FLOW IN AQUIFERS IN CRETACEOUS ROCKS IN THE CENTRAL COASTAL PLAIN, NORTH CAROLINA.
Geological Survey, Raleigh, NC. Water Resources Div.
J. L. Eimers, W. L. Lyke, and A. R. Brockman.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4153, 1990. 101p, 43 fig, 11 tab, 41 ref.

Descriptors: *Aquifer characteristics, *Coastal plains, *Geohydrology, *Groundwater movement, *Mathematical models, *North Carolina, Groundwater management, Hydrogeologic units.

The principal water supply aquifers in Cretaceous rocks in the central Coastal Plain of North Carolina are the Peedee, Black Creek, and upper Cape Fear aquifers. Groundwater withdrawals from this aquifer system have increased from about 0.25 million gal/day in 1910 to more than 30 million gal/day in 1986, causing water level declines of as much 160 ft. The maximum rate of water level decline has been about 11 ft/yr in the Black Creek aquifer. A quasi-three dimensional groundwater flow model was constructed and calibrated for the period 1900 to 1986 to simulate this decline and to provide a means to estimate the effects of future pumping. Comparisons of 1,867 observed and computed water levels were made at 323 well sites. The average difference between computed and observed water levels is -1 ft. About 68% of the differences between computed and observed water levels falls in the range from -21.0 to 21.0 ft. Net flow across the top of the aquifers in Cretaceous rocks has changed from a discharge of 2 million gal/day in 1900 to a recharge of 18 million gal/day in 1986. The model was used to simulate the effects of two pumping scenarios on water levels through 1991. For these simulations, the model indicated additional declines of 10 and 30 ft. (USGS)

SUMMARY OF PUBLIC WATER-SUPPLY WITHDRAWALS AND GEOHYDROLOGIC DATA FOR THE LOWER CONNECTICUT RIVER VALLEY FROM WINDSOR TO VERNON, VERMONT.
Geological Survey, Bow, NH. Water Resources Div.
J. Ayotte.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 88-341, 1989. 35p, 4 fig, 3 tab, 16 ref.

Descriptors: *Connecticut River Valley, *Geohydrologic data, *Geohydrology, *Groundwater resources, *Public water supply, *Vermont, *Water resources data, Groundwater, Hydrology, Seismic reflection, Seismic refraction, Stratified-drift aquifers, Stratigraphic logs, Water resources, Well surveys.

Public water supply withdrawal data and geohydrologic data were collected along a 50 mile segment of the Connecticut River valley from Windsor to Vernon, Vermont. An inventory of wells indicates that domestic groundwater supplies come primarily from bedrock, whereas public water supplies are derived from discontinuous, glacial sand and gravel deposits. Self supplied industries generally use surface water supplies. Data from eight seismic-refraction surveys, and from a seismic-reflection survey along this 50-mile reach of the Connecticut River, were compared with stratigraphic information from 217 drillers' logs. Stratified-drift deposits range from 0 to 270 ft and average about 65 ft. Stratigraphic information from drillers' logs and seismic-reflection records show that predominantly fine-grained stratified drift fills the valley and that coarse sand and gravel deposits exist discontinuously within this area. (USGS)

GEOLOGY AND GROUND-WATER RESOURCES OF THE MEMPHIS SAND IN WESTERN TENNESSEE.
Geological Survey, Nashville, TN. Water Resources Div.
W. S. Parks, and J. K. Carmichael.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 88-4182, 1990. 30p, 9 fig, 2 plates, 4 tab, 20 ref.

Descriptors: *Aquifers, *Geohydrology, *Groundwater, *Groundwater availability, *Tennessee, *Water quality, *Water resources data, Aquifer characteristics, Geologic formations, Geology, Groundwater movement, Groundwater recharge, Memphis Aquifer, Memphis Sand, Potentiometric level, Stratigraphy, Structural geology, Water level fluctuations, Water supply development.

The Memphis Sand of the Claiborne Group of Tertiary age underlies approximately 7,400 sq mi in western Tennessee. The formation consists primarily of a thick body of very fine to very coarse sand that contains subordinate lenses or beds of clay and silt at various horizons. The Memphis Sand ranges from 0 to about 900 ft in thickness. Recharge to the Memphis aquifer is from precipitation on the outcrop or by downward infiltration of water from the overlying fluvial deposits of Tertiary and Quaternary age and alluvium of Quaternary age. Long-term data indicate that water levels in the Memphis aquifer have declined at average rates ranging from less than 0.1 to 1.3 ft/yr during the period 1928-83. The water generally is a calcium bicarbonate type. It contains low concentrations of most major constituents and generally is suitable for most uses. Dissolved solids concentrations range from 19 to 333 mg/L. Seventy-six aquifer tests made during the period 1949-62 indicate that transmissivities range from 2,700 to 53,500 sq ft/day and storage coefficients range from 0.0001 to 0.003. The Memphis aquifer presently provides moderate to large quantities of water for many public and industrial water supplies in western Tennessee, and small quantities to numerous domestic and farm wells. Withdrawals for public and industrial supplies in 1983 averaged about 225 million gal/day, of which 183 million gal/day was in the Memphis area. The Memphis aquifer has much potential for future use, particularly outside the Memphis area. (USGS)

HYDROLOGY OF THE POWDER RIVER ALLUVIUM BETWEEN SUSSEX, WYOMING, AND MOORHEAD, MONTANA.
Geological Survey, Cheyenne, WY. Water Resources Div.

B. H. Ringen, and P. W. Daddow.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4002, 1990. 48p, 17 fig, 7 tab, 20 ref. USGS Project No. WY078.

Descriptors: *Alluvial aquifers, *Montana, *Potential water supply, *Powder River Basin, *Surface-groundwater relations, *Wyoming, Dissolved solids, Moorhead, Sussex, Well data.

The potential for developing water supplies from the alluvium along the Powder River between Sussex, Wyoming, and Moorehead, Montana, is very limited. The areal extent and saturated thickness of the alluvium are not large. Water in the alluvium primarily is derived from seepage from the river, which goes dry periodically. Low flow is sustained by groundwater discharge or irrigation return flow near Sussex, but not near Arvada, Wyoming, or Moorhead. The alluvium and the river have good hydraulic connection, but evidently are isolated from the bedrock. Pumpage from wells completed in the alluvium is highly dependent on water supplied directly from the river. The quality of water in the alluvium also limits use of the water. Although the quality improves downstream, it is unacceptable for drinking water and possibly for irrigation and some industrial uses, but is acceptable for most livestock watering. (USGS)

GEOHYDROLOGIC CHARACTERISTICS AND SIMULATED RESPONSE TO PUMPING STRESSES IN THE SPARTA AQUIFER IN EAST-CENTRAL ARKANSAS.
Geological Survey, Little Rock, AR. Water Resources Div.
D. J. Fitzpatrick, J. M. Kilpatrick, and H. McWreath.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 88-4201, 1990. 50p, 27 fig, 51 ref.

Descriptors: *Arkansas, *Geohydrology, *Groundwater, *Groundwater movement, *Model studies, *Sparta Aquifer, Water level fluctuations.

A finite difference digital model of the Sparta aquifer system in Arkansas was developed to aid in assessing the geohydrologic characteristics of the aquifer as well as the impact of withdrawals on water-level declines in the aquifer. The model consists of two layers. The Cockfield aquifer, represented by layer 1, was modeled as a constant head surface. The Sparta aquifer is represented by layer 2. The base of the Sparta aquifer was modeled as a no-flow boundary. The model boundaries to the north, south, and east in Mississippi were represented by specified heads, while boundaries to the west in Louisiana were represented as no flow. The model period of 1989 to 1985 was divided into 25 stress periods. Appropriate aquifer withdrawals were assigned to each stress period. Calibrated hydraulic conductivities of the Sparta aquifer, ranged from 1 to 35 ft/day. Calibrated hydraulic vertical conductivities of the Cook Mountain confining unit ranged from 0.0003 to 0.000009 ft/day. The calibrated storage coefficient of the aquifer was 0.0001. More than 80% of the recharge to the aquifer came from vertical leakage and from direct recharge on the outcrop. Greater than 90% of outflow from the aquifer was from pumpage or leakage to rivers. Theoretical pumping schemes to the year 2005 indicated that virtually no change to the potentiometric surface occurred when 1985 pumping rates were extended to 2005. Doubling of pumpage over the entire study area resulted in additional water-level declines of up to 130 ft. (USGS)

GROUND-WATER LEVELS, FLOW, AND SPECIFIC CONDUCTANCE IN UNCONSOLIDATED AQUIFERS NEAR LAKE ERIE, CLEVELAND TO CONNEAUT, OHIO, SEPTEMBER 1984.
Geological Survey, Columbus, OH. Water Resources Div.
A. W. Coen.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4202, 1990. 22p, 7 fig, 9 ref.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *Ohio, *Water resources data, Glacial drift, Specific conductivity, Water level, Water quality.

Groundwater levels and flow and specific conductance of water in aquifers underlying the southern shore of Lake Erie from Cleveland to Conneaut, Ohio were collected in September 1984 as part of the U.S. Geological Survey's Northeast Glacial Buried Valley Regional Aquifer-Systems Analysis. The 60 mile long study area extends inland from the lake about 10 miles and encompasses parts of Cuyahoga, Lake, and Ashtabula Counties. Water levels were measured in 202 wells, all of which were completed in glacial deposits. Specific conductance was measured in 59 of the wells. Water levels in most of the area are within 20 ft of the land surface. Groundwater flows locally toward streams and, regionally, to the north-northwest towards Lake Erie. Specific-conductance values ranged from 160 to 2,9000 microsiemens/cm at 25 C with a median value of 540 microsiemens/cm. Elevated specific-conductance values were randomly distributed areally and could derive from road-deicing salt, leachate from landfills, natural brines associated with oil and gas drilling, and the upward leakage of saline water from bedrock. The Oliolite Belt of the Yugoslav Inner Dinarides was considered to be a chaotic melange of the olistostrome type because of its very complicated tectonic fabric. Its sections of Triassic limestone were understood as thin slide sheets over ophiolites (diabases, cherts, ultramafics). Hydrogeological research, conducted in the last few years, refuted such theories. The results showed that Triassic limestone was much more common and was covered with ophiolites of the Jurassic age. Hydrochemical analysis established relationships between the main chemical components and groundwater in the area. They also made possible conclusions about the origin of karst groundwaters, properties of karst aquifers, and influences of ultramafics on the aquifers. Fifty-one percent of samples collected had characteristics of real calcareous waters. Thirty-three percent of the samples indicated a significant recharge of karst aquifers by leakage from ophiolite rocks. The remaining samples were waters with a calcium-magnesium ratio of less than one, which showed recharge from the ophiolites. By including silica content with the calcium-magnesium ratio, it became clear that magnesium in karst groundwater was from rocks rich in both magnesium and silica origin. Functional dependence between these elements has been proven. (Stoehr-PTT)

VARIABILITY AND DYNAMICS OF LEACHING OF THE FLYSCH CARPATHIAN SLOPE.
Polish Academy of Sciences, Krakow. Inst. of Geography and Spatial Organization.
A. Welc.
Catena, Vol. 16, No. 2, p 425-435, April 1989. 9 ref, 2 tab, 13 ref.

Descriptors: *Carpathian Mountains, *Flysch, *Geochemistry, *Leaching, *Water circulation, *Weathering, Climates, Groundwater flow, Sandstones, Seasonal variation, Shales.

The mechanism, dynamics and variability of leaching caused by water circulation within the various flysch slopes in the Polish Carpathian Mountains was investigated using two slopes as examples.

Leaching on the slopes built of Magura sandstones is less intensive than that on the slopes sculptured in limy sandstones and marly shales. In the case of the first slope, the salts were carried away mainly by groundwater circulating in deeper levels of the weathering covers and rocky substratum. In the second case, the majority of the salts were carried away by surface and shallow subsurface runoff. Therefore, lithological differentiation of the flysch affected the water circulation pattern and leaching of the slopes. Differentiated climatological conditions during one year resulted in patterns and intensities characteristic for a given condition of leaching of the slopes. Irregular influences of the oceanic and continental climates in this part of Europe cause the leaching to prevail in summer in certain years and in winter in others. Studies lasting several years indicated that leaching of slopes prevailed in the winter period with particular intensification of the process in January and March. Despite the long-lasting periods of leaching of the slope covers in some years, short periods usually decide the magnitude of leaching. (Author's abstract)

HUMUS FORM DEVELOPMENT AND HILLSLOPE RUNOFF, AND THE EFFECT OF FIRE AND MANAGEMENT, UNDER MEDITERRANEAN FOREST IN NE-SPAIN.
Amsterdam Univ. (Netherlands). Lab. for Physical Geography and Soil Science.
J. Sevink, A. C. Imeson, and J. M. Verstraten.
Catena, Vol. 16, No. 2, p 461-475, April 1989. 3 fig, 4 tab, 16 ref.

Descriptors: *Decomposing organic matter, *Forest fires, *Forest management, *Forest soils, *Humus, *Runoff, *Soil types, *Spain, *Wetlands, Infiltration capacity, Plant growth, Soil horizons, Soil water.

Study of a series of plots on acid to intermediate rocks under well preserved mediterranean type forests in northeast Spain showed that soils have well developed mor or moder type humus forms. Mor type humus forms were observed in soils with a shallow lithic contact or an abrupt textural change, and consist of an ectorganic layer (L, Fq, H) abruptly overlying a generally water repellant Ae or E horizon. Moder type humus forms, with a gradual transition between ectorganic layer (L, Fa and Ah horizon), were found in soils with more favorable rooting and soil moisture conditions, indicating that these conditions have a strong control over humus development. Quantities of organic matter (ectorganic layer and Ah/Ae) ranged from about 5 kg/sq m in mor to about 10 kg/sp m in moder humus forms, the difference being due to the presence of a well-developed Ah horizon in the latter. Rainfall simulator experiments showed that slopes with more type humus forms are likely to produce hillslopes runoff during summer rain storms in spite of the relatively high storage capacity of the ectorganic layer. This is due to the hydrophobicity of the mineral top soil (if dry), which hampers infiltration. Furthermore, during the wet season the soils commonly have a perched water table, inducing saturated overland flow. Slopes with moder type humus forms, on the contrary, are very unlikely to produce any hillslope runoff, because of the high storage and infiltration capacity of the soils. (Author's abstract)

IDENTIFICATION, CHARACTERIZATION, AND HYDROLOGICAL IMPLICATIONS OF WATER REPELLENCY IN MOUNTAIN SOILS, SOUTHERN BRITISH COLUMBIA.
Toronto Univ. (Ontario). Dept. of Geography.
G. Barrett, and O. Slaymaker.
Catena, Vol. 16, No. 2, p 477-489, April 1989. 8 fig, 1 tab, 23 ref.

Descriptors: *British Columbia, *Soil moisture retention, *Soil water, *Water repellent soils, Organic matter, Soil chemistry, Soil physical properties, Soil profiles.

The physicochemical properties of soils, which determine how readily the soils wet, were shown to vary significantly in mountain soils collected at six sites in southern British Columbia, even within individual profiles. The results of water drop penetration time were used to classify samples using a very simple scheme which is based upon the current understanding of the possible physicochemical interactions between soil surfaces, water, and soil air. In all cases where the samples were collected at sites in the subalpine-alpine ecotone, a layer which either wets reluctantly or is water-repellant exists at or near the surface of the profile. These layers occur only where there is evidence for accumulation of organic matter, and are usually no more than a few centimeters thick. At the one site which was below the alpine-subalpine ecotone, the soils wet readily throughout the profile. These results suggest that the type of organic matter which accumulates in soils of the alpine-subalpine ecotone of southern British Columbia either limits the affinity of soils for water or renders the soil water-repellant. APPLICATION OF A SIMPLE LUMPED RIVER FLOW FORECASTING MODEL TO HILLSLOPE SOIL WATER STORAGE ESTIMATION.
Kobe Univ. (Japan). Dept. of Agricultural Engineering.
T. Hata, and M. G. Anderson.
Catena, Vol. 17, No. 3, p 249-259, June 1990. 5 fig, 1 tab, 21 ref.

Descriptors: *Hydrologic models, *Model studies, *Rainfall-runoff relationships, *River flow, *River forecasting, *Soil water, Catchments, Hydrology, Slopes, Topography, Watersheds.

For a number of applied geomorphological and hydrological problems, the prediction of hillslope soil water conditions from restricted data is frequently required. Physically based distributed models of catchment hydrology are currently regarded as too cumbersome to meet these requirements either operationally or in a standard research context. A simple lumped sequential flow forecasting model is applied to a 0.73 sq km catchment. The catchment selected for modeling was located at Winford, near Bristol, England. Parameterization of the model was undertaken using the following data sources: 193 days of daily precipitation, air temperature, soil moisture, and discharge data. The hillslope sectors, into which the catchment is subdivided, are represented by their mean slope angles and are assumed rectangular in plan. Each hillslope sector has its own maximum water storage. The governing equations of subsurface, overland, and channel flow utilize Darcy's equation, Manning's equation, and the continuity equation. If field permeability is available, there is significant potential for the scheme to estimate the mean soil water storage in catchment segments. In addition, the model provides reliable river flow forecasting. Further, more extensive trials of the model are needed on catchments with differing topography to compare with the preliminary results reported here. (Author's abstract)

RAINFALL INDUCED SOIL SEAL (C) A DYNAMIC MODEL WITH KINETIC ENERGY INSTEAD OF CUMULATIVE RAINFALL AS INDEPENDENT VARIABLE.
Hebrew Univ., Rehovoth (Israel). Dept. of Soil and Water Sciences.
Y. Mualem, S. Assouline, and H. Rohdenburg.
Catena, Vol. 17, No. 3, p 289-303, June 1990. 7 fig, 2 tab, 27 ref, append.

Descriptors: *Hydrologic models, *Kinetic energy, *Rainfall, *Soil compaction, *Surface sealing, *Water repellent soils, Infiltration capacity, Rainfall infiltration, Rainfall intensity, Soil sealants, Soil types.

A dynamic model of soil sealing, based on an extension of a previous model that considers the seal as a non-uniform layer, and the rainfall kinetic energy as the rain property dominating the sealing process is presented. The model was applied in the case of two soils, sandy loam and loam, under saturated conditions, using an inverse procedure for its calibration. The validity of the theoretical model was examined for each soil by results of an infiltration test carried out under rainfall and flow boundary conditions different from those related to the data used for the model calibration. Very good agreement was found between the observed and the predicted infiltration curves in the case of sandy loam, but not as good in the case of loam soil. The error that may occur when using cumulative rainfall instead of rainfall kinetic energy as the independent variable of the soil sealing model was analyzed under varying conditions. In cases where the rainfall kinetic energy per unit mass is a constant, independent of the rainfall intensity, the use of the cumulative rainfall is equivalent to the use of the rainfall kinetic energy. However, rainfall events often include long rainfall of low intensity and short time intervals of high rainfall intensity, with the kinetic energy per unit mass varying considerably during a single rainfall event. In such a case, the use of the cumulative rainfall as the model variable may lead to considerable error. Applying the calibrated model for the sandy loam and characteristics of simulated and natural rainfall, the error associated with the use of the cumulative rainfall was found to lead to a large error in calculation of the infiltration rate during the sealing process. TEMPORAL VARIABILITY OF SOIL WETNESS AND ITS IMPACT ON CLIMATE.
Princeton Univ., NJ. Geophysical Fluid Dynamics Program.
S. Manabe, and T. Delworth.
Climatic Change CLCHDX, Vol. 16, No. 2, p 185-192, April 1990. 3 fig, 1 tab, 9 ref.

Descriptors: *Climates, *Climatology, *Clouds, *Mathematical models, *Soil water, Carbon dioxide, Diurnal variation, Evaporation, Precipitation, Relative humidity, Seasonal variation, Temporal distribution, Variability.

The temporal variability of soil wetness and its interactions with the atmosphere were studied using a general circulation model of the atmosphere, in which zonally uniform clouds are prescribed as a function of latitude and height; carbon dioxide is constant everywhere; the diurnal cycle is omitted but the seasonal cycle is included; the geographical and seasonal distribution of sea surface temperature and sea ice are prescribed; and precipitation is predicted whenever the relative humidity exceeds 100%. Time series of soil wetness computed by the model contain substantial amounts of variance at low frequencies, suggesting that interactions between soil moisture and the atmosphere have the potential to make substantial contributions to low frequency atmospheric variability. Long time-scale anomalies of soil moisture resemble the red noise response of the soil layer to white noise rainfall forcing. The temporal variability of soil moisture depends upon potential climatic values of evaporation and precipitation. (Brunone-PTT)

BASIC MODEL OF WATER- AND GAS-FLOW THROUGH SMECTITE CLAY BUFFERS.
Clay Technology A.B., Lund (Sweden). Ideon Research Center.
R. Pusch, and H. Hokmark.
Engineering Geology EGGOAO, Vol. 28, No. 3/4, p 379-389, 1990. 9 fig, 8 tab, 6 ref.

Descriptors: *Bentonite, *Clay minerals, *Clays, *Hazardous waste disposal, *Liners, *Radioactive waste disposal, *Smectite, *Soil physical properties, *Soil porosity, *Void space, Gels, Geohydrology, Hydration, Hydraulic properties, Interstitial water, Montmorillonite, Permeability, Sodium, Soil density, Soil water, Sweden.

A large number of voids combine to form natural passageways for water or gas in soft rather than in very dense smectite clays. The very dense artificially-produced sodium (Na) montmorillonite clay materials used for isolating purposes in Swedish repositories for radioactive wastes have microstructural features formed by the initial arrangement of bentonite grains that are compressed to yield elements of highly compacted bentonite. Canister embedment of highly compacted Na bentonite forms a low-permeable medium of significant homogeneity both macroscopically and microscopically. However, despite the fact that a large part of the pore water is in interlamellar positions and not mobile by ordinary hydraulic gradients, there are still a number of pore passages that let water and gas through even at very high bulk densities. A microstructural model of artificial Na montmorillonite clay was examined. A study of this model indicates that the microstructure of 'artificial' Na montmorillonite clay, formed from bentonite powder grains, controls all the relevant transport mechanisms. The key feature of the model is that the dense grains constitute a basic network with continuous 'external' voids of varying size. At hydration of the system under confined conditions the grains expand and reduce the porosity, and the remaining voids become filled by soft clay gels that emanate from the dense grains. The density of these gels is a function of the void size; there is a significant variation in hydraulic and gas conductivities as well as in ion diffusivity over a cross-section of the clay. DUAL WATER FLOW PATTERN IN THE UNSATURATED ZONE UNDER A GYPSUM-AMENDED SOIL.
Weizmann Inst. of Science, Rehovoth (Israel).
H. Gvirtzman, M. Magaritz, and A. Nadler.
Journal of Soil Science JSSCAH, Vol. 41, No. 2, p 177-187, June 1990. 7 fig, 1 tab, 20 ref.

Descriptors: *Aeration zone, *Flow velocity, *Gypsum, *Infiltration, *Soil amendments, *Soil science, *Soil water, *Solute transport, Boreholes, Environmental tracers, Field tests, Groundwater movement, Irrigation water, Loess, Saline groundwater, Tritium.

Substantial progress has been made in describing the process of water and solute transport in the unsaturated zone by means of mathematical and conceptual models, and by column displacement experiments. Unfortunately, field studies, which are of critical importance for understanding natural transport processes in the unsaturated zone, are still relatively rare, possibly due to the methodological difficulties of tracing water and solute transport. One of the methods for conducting in situ field measurements is by using environmental isotopes as tracers, such as tritium. The tritium dating method was applied in order to describe the water flow mechanism in a natural field that has been irrigated by saline sodic waters and reclaimed by extensive gypsum application. Sediment samples were obtained from boreholes down to approximately 20 m in a gypsum-treated, saline water irrigated soil, and from nearby uncultivated fields at two locations. Measurements of tritium concentrations in the soil solution enabled the determination of two types of flow in the unsaturated zone: fast and slow. The slow component, the 'piston-flow type' in the sandy loess section of the first location had a vertical velocity of 0.16m/a, and in the clayey loess section of the second location had a vertical velocity of 0.23 m/a. The faster component typically transported the solution through fractures and other preferred paths. The percentage of the slow component was 40% in the sandy and 60% in the clayey loess. A previous prediction of delayed transport of salts was verified and is related to the interaction between chemical composition of irrigation water and the agrotechnical practices of gypsum application. SIMPLIFIED ANALYSIS OF SOIL WATER FLOW TO A MOLE DRAIN.
Massey Univ., Palmerston North (New Zealand). Dept. of Soil Science.
D. R. Scotter, L. K. Heng, D. J. Horne, and R. E. White.
Journal of Soil Science JSSCAH, Vol. 41, No. 2, p 189-198, June 1990. 4 fig, 1 tab, 21 ref.

Descriptors: *Data interpretation, *Mole drainage, *Soil water, *Soil water table, *Surface runoff, *Surface-groundwater relations, Drainage coefficient, Drainage practices, Dupuit-Forchheimer theory, Evaporation, Flow rates, Hydraulic conductivity, Hydrographs, Percolation, Rainfall intensity, Soil porosity, Soil properties, Soil science, Soil texture.

There is a long standing interest in simplified analyses of soil water movement to drains as a function of rainfall and soil hydraulic properties. An analysis has been developed which allows transient mole drain flow, surface runoff and water table depth to be computed, given measured or assumed values for rainfall, evaporation, deep percolation, mole drain spacing and depth, surface detention, the drainage coefficient, and the saturated hydraulic conductivity, total porosity and macroporosity of the topsoil and subsoil. The Dupuit-Forchheimer flow below the water table, and the vertical hydraulic potential equilibrium above the water table are assumed. The analysis was successfully tested by simulating the hydrographs for three contrasting rainfall events in New Zealand in 1988. The 6 October rainfall event was short and intense. The 29 June event had a lower maximum intensity and extended over a longer period. The 24 July rainfall event was unusually large and intense. Of note are the high maximum drain flow rates, and the rapid response of the drainage flow to changes in rainfall intensity. Only during this large rainfall event did a quasi-steady state occur, with drain flow approximately equal to rainfall intensity. The peak flow rates indicate how effective preferential flow can be in moving water to mole drains in fine-textured soils. The prediction of somewhat earlier than observed initial responses in drain flow to rain is probably due to the assumption of instantaneous vertical hydraulic potential equilibrium in the soil. This approach for modeling the behavior of mole drains is easy to use, and needs only readily obtainable soil physical and weather data as inputs. (Fish-PTT)

EXPERIMENTAL TESTING OF TRANSIENT UNSATURATED FLOW THEORY AT LOW WATER CONTENT IN A CENTRIFUGAL FIELD.
Geological Survey, Menlo Park, CA. Water Resources Div.
J. R. Nimmo.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1951-1960, September 1990. 10 fig, 1 tab, 26 ref.

Descriptors: *Flow equations, *Hydraulic conductivity, *Laboratory methods, *Soil properties, *Soil water, *Unsaturated flow, Centrifugation, Experimental data, Sand, Testing procedures.

Experimental measurements and theoretical predictions of transient moisture conditions have been compared for a sandy soil approaching hydrostatic equilibrium in a centrifugal field. Starting near saturation, samples were centrifuged at constant speed with a constant suction at the outflow boundary. Water flowed freely out of the sample through a porous plate. Step increases in centrifuge speed produced transient moisture conditions suitable for comparison between experiment and theory. Measurements of electrical conductivity by a direct contact four-electrode technique indicated the water content according to a calibration based on known moisture conditions at various equilibrium states. A specially modified centrifuge permitted electrical measurements during centrifugation. For comparison, the transient water contents were computed by a finite-difference solution of Richards' equation (modified by replacing gravitational with centrifugal potential), using soil characteristics measured previously by steady state techniques. The time dependence of water content changes, used as the basis for comparison between experiment and theory, shows agreement which is reasonable given the degree of uncertainty of the measurements. The experiment confirms, within a factor of 4, the validity of Richards' equation for moisture conditions as dry as 25% of saturation, over a hydraulic conductivity range of 5 x 10 to the minus 11th power to 1 x 10 to the minus 8th power m/s, and in a centrifugal field up to about 200 g. INVERSE SOLUTION FOR ONE-DIMENSIONAL INFILTRATION, AND THE RATIO A/K1.
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmental Mechanics.
J. R. Philip.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2023-2027, September 1990. 1 fig, 2 tab, 10 ref.

Descriptors: *Infiltration, *Mathematical analysis, *Soil water, *Unsaturated flow, Infiltration coefficient, Mathematical equations, Soil physical properties, Soil texture.

The inverse method of solving the nonlinear diffusion equation was extended to give the two leading terms of the infiltration series solution of the nonlinear Fokker-Planck equation of unsaturated flow. The method was used, together with a new integral result for the ratio A/K1, to investigate the physical determinants of A/K1. K1 is the saturated

LIBRARY U. S. GEOLOGICAL SURVEY RESTON, VA

conductivity, and A the second coefficient of the two-term infiltration equation i = St(1/2) + At. The relatively superficial direct effect of the initial moisture content 0o (important only when 0o is very large) was separated from the more complicated effect, dependent both on soil texture and on 0o, of the shapes of the diffusivity D and the conductivity derivative dK/d0. Normalized first moments of these functions measure the steepness of their variation. The full range of combinations of shapes of D and dK/d0 from essentially flat to essentially infinite steep was examined. For soils with Ko/k1 negligibly small, A/K1 lies in the range 0 to 2/3. The dominant physical effect is that A/K1 decreases monotonically as dK/d0 increases in steepness. On the other hand, A/K1 increases (relatively slowly) with the steepness of D. (Author's abstract)

APPROXIMATE SOLUTIONS FOR CATION TRANSPORT DURING UNSTEADY, UNSATURATED SOIL WATER FLOW.
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Soils.
W. J. Bond, and I. R. Phillips.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2195-2205, September 1990. 6 fig, 42 ref, 2 append. Australian Water Research Advisory Council Project 84/164.

Descriptors: *Mathematical analysis, *Path of pollutants, *Porous media, *Soil water, *Solute transport, *Unsaturated flow, *Unsteady flow, Adsorption, Cation exchange, Cations, Dispersion, Infiltration, Interstitial water, Isotherms.

Approximate analytical solutions were derived for the transport of reactive solutes during unsteady flow of water in unsaturated porous media. The solutions apply to solutes that undergo adsorption reactions including ion exchange, specific adsorption, or negative adsorption (anion exclusion). No particular form of adsorption or exchange equation was assumed, and solutions were developed for both unfavorable (concave upward) and favorable (convex upward) isotherms, as well as for multisite isotherms. The main approximations that were assumed in deriving the solutions are (1) that local chemical and physical equilibrium is attained rapidly relative to the time scale for transport, (2) that the reaction takes place in a region of constant total charge concentration in both the solution and solid phases, (3) that the effects of dispersion and the shape of the adsorption isotherm may be treated separately and then combined, and (4) that as has been assumed previously for unsteady flow of nonreactive solutes, the water content and pore water velocity may be treated as constant over the region of dispersion. The solutions were tested using experimental data for the transport of exchanging cations during horizontal infiltration in laboratory columns. The solution for unfavorable isotherms was compared with data for sodium invading a calcium-dominated soil; that for multisite isotherms, which combines the solutions for both favorable and unfavorable isotherms, was compared with data for potassium invading a calcium-dominated soil. In both cases, good agreement was found between the measured distributions of solution and sorbed cations and those predicted using these solutions together with independently measured cation exchange isotherms. STOCHASTIC ANALYSIS OF UNSATURATED FLOW: ONE-DIMENSIONAL MONTE CARLO SIMULATIONS AND COMPARISONS WITH SPECTRAL PERTURBATION ANALYSIS AND FIELD OBSERVATIONS.
California Univ., Davis. Dept. of Land, Air and Water Resources.
K. Unlu, D. R. Nielsen, and J. W. Biggar.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2207-2218, September 1990. 13 fig, 2 tab, 21 ref.

Descriptors: *Hydraulic properties, *Model studies, *Monte Carlo method, *Soil water, *Stochastic models, *Unsaturated flow, Flow equations, Hydraulic conductivity, Mathematical models, Statistical analysis.

A numerical experiment was designed to study the stochastic behavior of one-dimensional transient unsaturated flow in a Monte Carlo setting. Soil hydraulic properties, log-saturated hydraulic conductivity (ln K sub s), pore size distribution parameter(alpha), and the specific water capacity (C) were assumed to be statistically homogeneous random fields described by exponential correlation functions with identical correlation lengths. Fifty realizations of each soil hydraulic property, with statistical properties obtained from a field experiment, were generated by using a nearest-neighbor model. Numerical solutions of the one-dimensional flow equation are used repeatedly to obtain realizations of soil water pressure head and flux corresponding to the realizations of ln K sub s, alpha, and C. The dependence of the pressure head and flux on the statistical properties of ln K sub s, alpha, and C and the magnitude of the hydraulic head gradient prevailing at the lower boundary were investigated. In addition, results of Monte Carlo analysis and spectral perturbation analyses were compared with field observations. The greatest variability of the soil water pressure head and flux were observed when soil hydraulic properties are uncorrelated and have large variances and integral scales and when G at the lower boundary is unity. The Monte Carlo and spectral perturbation analyses tend to agree reasonably well for the flow domains in which ergodicity of local soil hydraulic properties is assured. Results of the Monte Carlo and spectral perturbation analyses are also supported by field observations. (Author's abstract)

Descriptors: *Agricultural practices, *Soil water, *Soil-plant-water relationships, *Wheat, Defoliation, Forages, Water potentials.

Although extensive work has evaluated plant response to season of defoliation, few studies have evaluated the influence of season of defoliation on soil water depletion, amount of regrowth, and total seasonal biomass production. This 5-year study evaluated the effect of clipping date and yearly climatic variation on soil water depletion, amount of regrowth, and total seasonal forage production. Timing of clipping significantly affected soil water depletion patterns. Clipping at the early vegetative phase had little effect on soil water potential unless soil water potentials were below 0.03 MPa. In mid-June soils beneath plants defoliated during the boot stage were consistently wetter than soils beneath undefoliated plants. However, total seasonal soil water depletion was usually similar among treatments by the end of the growing season. Phenology and the amount of standing crop present when defoliation occurred were significantly correlated with regrowth. Date of defoliation also significantly affected total production in wet years. Total seasonal foliage production on plots clipped during the boot stage was generally lower than on plots clipped during the vegetative or late flowering stages of development. (Author's abstract)

CAUSES OF SOIL SALINIZATION: 2. A BASIN IN EAST-CENTRAL ALBERTA, CANADA.
Alberta Agriculture, Lethbridge.
M. J. Hendry, G. W. Chan, and D. B. Harker.
Ground Water GRWAAP, Vol. 28, No. 4, p 544-550, July/August 1990. 8 fig, 2 tab, 13 ref.

Descriptors: *Alberta, *Evaporation, *Geohydrology, *Groundwater, *Groundwater flow, *Model studies, *Saline soils, *Tritium, Canada, Flow models, Hydraulic conductivity, Ponding, Snowmelt, Water table.

The cause of soil salinization in a 21-ha area of gently rolling topography in Alberta was investigated. The geology of the basin consists of lenticular Cretaceous sediments overlain by tills and lacustrine deposits. Interpretation of vertical hydraulic-head data showed that regional discharge of groundwater from bedrock is not a cause of salinization in the study area. Results of stream function modeling suggested that most of the water causing salinization is not derived from local topographic highs. Modeling results also suggested that the direction of groundwater flow throughout the area is vertically downward through unconsolidated Quaternary deposits and into bedrock. Tritium analyses of pore water distilled from core samples confirmed that the groundwater causing salinization was not derived from the local topographic highs, nor from the deeper geologic deposits. Hydrograph analysis indicated that the salinization was derived from evaporation from seasonally high water tables caused by ponded surface water and spring snowmelt in localized depressional areas. EVALUATE A SOIL LOSS PREDICTION MODEL COMBINED WITH AN INFILTRATION MODEL FOR TILLED SOILS.
South Dakota State Univ., Brookings. Dept. of Agricultural Engineering.
S. T. Chu, and R. A. Kohl.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-217233/AS. Price codes: A03 in papercopy, A01 in microfiche. South Dakota Water Resources Institute, Brookings, Completion Report, August 1988. 23p, 1 fig, 12 tab, 7 ref. USGS Contract No. 14-08-0001-G1449-04. USGS Project No. G1449-04.

Descriptors: *Infiltration models, *Sediment erosion, *Soil conservation, *Soil erosion, *Soil stabilization.

Soil and water are two basic resources necessary to human existence. Soil erosion strips the top soil away from the ground surface and depletes the productivity of the land. The transported sediment fills the reservoirs and accumulates in the waterways, which shortens the life of reservoirs and is the major cause of downstream flooding problems. Nutrients, organic matter, pesticides and insecticides carried by the sediments are the primary sources of water pollution from agricultural lands.

A soil loss prediction model is a useful tool to identify erosion hazard sites and is a time saving substitute for the field measurements. Soil loss estimation and prediction is an integral part of a well organized soil erosion control program. The purpose of this research was to combine an infiltration model for tilled soils with an existing soil loss model for soil loss prediction on tilled soils. Horton's model was shown to be adequate to describe the infiltration process on bare tilled soil where the development of a surface seal is the mechanism to determine surface runoff. The Green-Ampt infiltration model was shown to be adequate to describe the infiltration process on well protected tilled Vienna loam. For the partially protected tilled soil plots, neither of the two infiltration models provides good performance. The sediment loading ratio was shown to be a useful parameter in soil loss prediction. The product of the sediment loading ratio and the calculated runoff from the infiltration models is the predicted soil loss. (USGS)

MODELLING SOIL WATER SUPPLY TO CROPS.
Wye Coll., Ashford (England). Dept. of Agriculture, Horticulture and the Environment.
H. F. Cook, and D. L. Dent.
Catena, Vol. 17, No. 1, p 25-39, February 1990. 10 fig, 29 ref.

Descriptors: *Agricultural hydrology, *Agronomy, *Model studies, *Simulation analysis, *Soil surveys, *Soil water, *Soil-water-plant relationships, Crop yield, Hydraulic conductivity, Soil moisture retention, Soil properties, Soil water potential, Transpiration, Water demand, Water supply.

Process simulation models are needed to make use of static soil survey data to predict crop performance. One critical link in this chain, the supply of water by the soil to meet the transpirational demand of crops, has been modelled on the assumption that water supply is directly related to soil water potential. Field testing of this simple model shows a close correlation between predicted and measured supply of water over a range of crops and soils grouped according to their soil water release characteristics. Crop water use and soil water-induced stress can be predicted by a demand-supply model based on: water demand estimated from Penman evapotranspiration and K ab c values for the crop; allocation of this demand through the soil profile according to the activity of the root system; water release by the soil according to soil water potential (the model requires soil water release curves for the topsoil and subsoil or classification of soils into hydrological families defined by their soil water release characteristics); and estimates of effective rainfall and upward flux of water from below the root zone. RAINFALL INDUCED SOIL SEAL: (A) A CRITICAL REVIEW OF OBSERVATIONS AND MODELS.
Hebrew Univ., Rehovoth (Israel). Dept. of Soil and Water Sciences.
Y. Mualem, S. Assouline, and H. Rohdenburg.
Catena, Vol. 17, No. 2, p 185-203, April 1990. 45 ref.

Descriptors: *Infiltration, *Infiltration rate, *Model studies, *Rainfall impact, *Reviews, *Runoff, *Soil surfaces, *Surface sealing, Chemical properties, Hydraulic conductivity, Particle size, Particulate matter, Physical properties, Soil properties, Soil water, Suspended solids.

Most soils exposed to rainfall are subjected to physical and chemical processes which change their properties at the vicinity of the soil surface. This phenomenon, called soil seal, can be harmful to agriculture. It decreases the infiltration rate, reduces the available water at the root zone, increases runoff and soil erosion and affects seedling and plant growth. This review explains the definition of rainfall induced soil seal, the mechanisms involved in its formation, its properties, and its role in shaping the soil water regime. The review concludes: (1) no universal seal, such as skin 0.1 mm, can accurately represent a real seal layer, (2) seal properties depend on both rainfall and soil properties. (3) soil sealing depends on initial and boundary conditions. (4) the infiltration rate is determined by the state and properties of the seal layer, as well as the undisturbed subsoil subjected to the particular boundary conditions; and (5) the physical identity of soil seal cannot be fully represented by visible parameters, even with the aid of microscopes or scanning electron microscopy. RAINFALL INDUCED SOIL SEAL: (B) APPLICATION OF A NEW MODEL TO SATURATED SOILS.
Hebrew Univ., Rehovoth (Israel). Dept. of Soil and Water Sciences.
Y. Mualem, S. Assouline, and H. Rohdenburg.
Catena, Vol. 17, No. 2, p 205-218, April 1990. 9 fig, 1 tab, 11 ref.

Descriptors: *Hydraulic conductivity, *Hydraulic gradient, *Infiltration, *Infiltration rate, *Model studies, *Rainfall impact, *Saturated soils, *Soil types, Clays, Loam, Physical properties, Sand, Silt, Soil properties, Soil water, Surface permeability, Suspended solids.

A conceptual model is proposed in which the saturated soil seal (crust) properties are derived on the basis of physical concepts estimated empirically. The reduced hydraulic conductivity of the soil surface is attributed to its decreased porosity and increased ineffective water content. The characteristics of the modeled soil seal were examined using data of sandy loam and loam (loess) soils. An inverse approach was applied for calibration using infiltration rate data. The results indicate that the importance of the 0.1 mm compact clay and silt seal layer (the skin) has been overestimated. The sealing of bare soils formed under high-energy rainfall cannot be attributed to the skin. The suggested theory allows the seal properties, including its thickness and hydraulic conductivity, to vary with respect to rain and soil properties as well as the flow boundary conditions. Seal thickness, hydraulic conductivity and conductance were calculated as a function of the driving hydraulic head for the two soils. The sandy loam had a thicker sealing layer with a higher hydraulic conductivity and sensitivity to flow conditions than the loam. While the hydraulic conductance of the loam seal decreased slowly as a function of the hydraulic gradient, the conductance of the sandy loam soil dropped sharply with an increase in the hydraulic gradient, and reached a lower value than that of the loam for large gradients. MOLYBDENUM AND SULFATE AS CONTROLS ON THE ABUNDANCE OF NITROGEN-FIXING CYANOBACTERIA IN SALINE LAKES IN ALBERTA.
Cornell Univ., Ithaca, NY. Section of Ecology and Systematics.
R. Marino, R. W. Howarth, J. Shamess, and E. Prepas.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 245-259, March 1990. 4 fig, 6 tab, 60 ref. NSF Ecosystems Study Program Grant BSR 86-04688.

Descriptors: *Alberta, *Cyanophyta, *Limiting nutrients, *Limnology, *Molybdenum, *Nitrogen fixation, *Saline lakes, *Sulfates, Chemical analysis, Model studies, Nitrogen, Nutrient requirements, Phosphorus, Regression analysis, Statistical analysis.

Thirteen saline lakes in Alberta were studied to test the hypothesis that Mo availability influences the abundance of planktonic, N-fixing cyanobacteria in saline ecosystems. Earlier work in oxic seawater showed that the availability of Mo is controlled in part by the ratio of sulfate to Mo because sulfate inhibits the assimilation of molybdate. The sulfate:Mo ratio in seawater is very high relative to most freshwater lakes, a finding that is consistent with the scarcity of planktonic, N-fixing cyanobacteria in coastal marine ecosystems. This ratio is constant in seawater; however, limiting a test of this hypothesis in marine systems. The Alberta salt lakes provide a more robust test in saline systems. The ratio of sulfate to Mo within any given saline lake was relatively constant over a summer season, but the ratio between lakes varied and ranged from values typical of freshwater lakes to values higher than in seawater. N-fixing cyanobacteria are significant fractions of the plankton in six of the 13 lakes studied and are rare or absent in the others. The sulfate:Mo ratio was a strong predictor of the abundance of planktonic, N-fixing cyanobacteria. However, sulfate or Mo concentrations alone were not. This finding is consistent with the hypothesis that sulfate can control Mo availability in oxic waters. Phosphorus concentrations, and the ratio of N to P, were not good predictors of the abundance of N-fixing cyanobacteria in these saline lakes although they often are in freshwater lakes. The differences between predictions from a freshwater, P regression model and actual abundances of N-fixing cyanobacteria in the saline lakes were best explained by the sulfate:Mo ratio. GROWTH AND VOLTINISM OF LOTIC MIDGE LARVAE: PATTERNS ACROSS AN APPALACHIAN MOUNTAIN BASIN.
Georgia Univ., Athens. Dept. of Entomology.
A. D. Huryn.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 339-351, March 1990. 6 fig, 6 tab, 36 ref. NSF Grants BSR 85-16497 and BSR 85-14328.

Descriptors: *Appalachian Mountains, *Aquatic insects, *Midges, *Stream biota, *Temperature effects, Larvae, Life cycles, Regression analysis, Seasonal variation.

The influence of thermal regime upon community-level growth rates and voltinism was estimated for larval Chironomidae inhabiting litter accumulations in four streams located in an Appalachian Mountain basin. Groups of larvae were confined in growth chambers and incubated in situ at time intervals representing the observed range of annual thermal variation. Estimates of daily growth rates (g) were derived from change in average length

over the incubation period. Using multiple regression, temperature and larval size were found to have significant positive and negative effects on g, respectively. Equations derived for each stream described a substantial proportion of the variance among observed g values (R(2) = 0.71-0.82) but did not differ significantly. Therefore, the data from all streams were combined to derive a single general equation which, along with larval size distribution, biomass, and temperature data, was used to model the variation in annual biomass turnover (G) and hypothetical size-dependent voltinism among the study streams. Size distribution of larvae did not differ significantly among streams and variation in G (range = 12.8-18.6) was attributed primarily to variation in thermal regime. Differences in voltinism were predicted to be minor, but were closely dependent on both terminal size of larvae and thermal regime. The model provides evidence that spatial variation of G on the order of 31% can be expected for midge communities within a < 30 square km area of this Appalachian Mountain basin. (Author's abstract)

FLUXES AND TRANSFORMATION OF AQUATIC PIGMENTS IN LAKE MENDOTA, WISCONSIN.
Wisconsin Univ.-Madison. Water Chemistry Program.
J. P. Hurley, and D. E. Armstrong.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 384-398, March 1990. 6 fig, 4 tab, 46 ref. NSF Grants DEB 80-12313 and EAR 88-16561.

Descriptors: *Carotenoids, *Chlorophyll, *Lake sediments, *Limnology, *Pigments, *Sediment chemistry, *Sedimentation, *Suspended solids, *Wisconsin, Chemical analysis, Microbial degradation, Seasonal variation, Suspended sediments.

Concentrations and fluxes of chlorophyll and carotenoid pigments were measured in suspended and settling particulate matter and in surface sediments in Lake Mendota. Flux comparisons were used to calculate the extent of alteration or degradation within the water column and at the sediment surface. Losses within the water column for specific time intervals ranged from almost negligible for diatoxanthin to 96% for peridinin. The extent of loss was influenced by pigment type and transport process. Surface sediment diagenesis in Lake Mendota resulted in differential degradation rates among chlorophyll and carotenoid constituents. Deposition of pheophorbide a, a grazing indicator, was most important during late spring, as zooplankton populations increased and chlorophyll levels in the water column dropped below 1 nmol/liter. The ability to trace the magnitude of this annual event through the sedimentary record was obscured by selective degradation of pheophorbide relative to chlorophyll and pheophytin. Similarly, carotenoid composition was dramatically altered both within the water column and at the sediment surface. Fucoxanthin and peridinin, major water column carotenoids, were degraded extensively before incorporation in the sediments. (Author's abstract)

MECHANISM FOR THE HYDROGEN SULFIDE-INDUCED GROWTH LIMITATION IN WETLAND MACROPHYTES.
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
M. S. Koch, I. A. Mendelssohn, and K. L. McKee.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 399-408, March 1990. 1 fig, 2 tab, 53 ref.

Descriptors: *Hydrogen sulfide, *Limnology, *Macrophytes, *Marshes, *Wetlands, Adenosine triphosphate, Anoxic conditions, Enzymes, Fermentation, Marsh plants, Metabolism, Nitrogen cycle, Phytotoxicity, Plant growth, Respiration.

Hydrogen sulfide, a phytotoxin that often accumulates in anoxic marine and freshwater marsh soils, suppressed the activity of alcohol dehydrogenase (ADH), then enzyme that catalyzes the terminal step in alcoholic fermentation, in the roots of two wetland macrophytes. This inhibition of root ADH activity with increasing sulfide concentration was associated with decreases in root total adenine nucleotide pool (ATP + ADP + AMP), the adenylate energy charge ratio (AEC), nitrogen uptake (percent recovery of 15NH4(+) as N) and growth (leaf elongation). These responses were species-specific with a greater negative impact in the freshwater marsh species that naturally inhabit low-sulfide environments. These findings lend support to the hypotheses that ADH activity, as a measure of fermentative metabolism, is important in maintaining the root energy status of wetland plants under hypoxic-anoxic conditions; that there is a significant negative effect of H2S on the anoxic production of energy in these roots; and that an important negative effect of H2S on plant growth is an inhibition of the energy-dependent process of N uptake. (Author's abstract)

RAPID AMMONIUM CYCLING AND CONCENTRATION-DEPENDENT PARTITIONING OF AMMONIUM AND PHOSPHATE: IMPLICATIONS FOR CARBON TRANSFER IN PLANKTONIC COMMUNITIES.
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
C. A. Suttle, J. A. Fuhrman, and D. G. Capone.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 424-433, March 1990. 7 fig, 34 ref. NSF Grants OCE 84-10074, OCE 87-11132, OCE 84-17595, and OCE 85-15886.

Descriptors: *Ammonium, *Estuaries, *Eutrophic lakes, *Limiting nutrients, *Limnology, *Nutrient cycling, *Organic carbon, *Phosphates, *Plankton, Marine environment, Nitrogen compounds, Nitrogen cycle, Nutrients, Radioisotopes, Seasonal variation, Size classes.

A short-lived radioactive isotope of nitrogen (N13, half-life = 10 min) of very high specific activity (> 100 mCi/micromole) was used to study NH4+ uptake at near-ambient concentrations in natural planktonic communities. The turnover times of the dissolved NH4+ pool in Long Island Sound ranged from tens of hours between April and early June to a fraction of an hour between mid-June and late July. The NH4+ turnover time was also rapid in a nearby eutrophic lake. Up to 50% of the ambient NH4+ flux into particulate material from Long Island Sound was attributable to organisms passing 1.0-micron polycarbonate filters. However, partitioning of NH4+ uptake among size classes was very concentration-dependent. A 0.5 micromolar addition resulted in an increase in NH4+ uptake by the > 3 micron size class of from 33% to > 80% of the total. Similar results were obtained for phosphate uptake into particulate matter from the Sargasso Sea. Although <20% of the ambient phosphate uptake was into particles > 1 micron, a 100 nanomolar pulse resulted in about 50% of the uptake entering the > 1 micron fraction. Because slight increases in NH4+ and phosphate concentration result in greater uptake by larger organisms with higher C:N and C:P ratios, distributing these nutrients in 'patches' of elevated concentration results in more C being transferred to higher level consumers. (Author's abstract)

DISTRIBUTION OF LABILE DISSOLVED ORGANIC CARBON IN LAKE MICHIGAN.
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
G. A. Laird, and D. Scavai.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 443-447, March 1990. 3 fig, 1 tab, 20 ref.

Descriptors: *Aquatic bacteria, *Carbon cycle, *Dissolved organic carbon, *Lake Michigan, *Limnology, *Nutrients, Lake stratification, Seasonal variation.

Identifying primary sources of labile dissolved organic carbon (LDOC) in pelagic systems has taken on new interest in light of recent evidence that a major portion of the C fixed via autotrophic production passes through heterotrophic bacteria and that much of the bacterial production is grazed. This transfer of LDOC to primary consumers captures C that might otherwise be lost. Bioassay-measured LDOC concentrations were compared in near-bottom and near-surface Lake Michigan water between April and October 1986. In five of seven experiments, the LDOC concentration was higher in near-bottom water. LDOC reached 40.2% of the total DOC pool in the near-bottom water in late May and 13.8% in the near-surface water in early July. Concentration in near-bottom water was highest during early stratification; concentration in surface water varied less but was highest in early July. The data suggest that an allochthonous source of labile organic C may be important. Annual buildup of LDOC in the deep regions, which becomes available to the surface waters during winter mixing, may not make as significant a contribution to the system as was previously believed. At least in spring, allochthonous sources focused by the spring thermal front movement may contribute significantly to the LDOC pool and may help account for some of the previously-noted imbalance between bacterial and phytoplankton production. (Author's abstract)

ALGAL USE OF SEDIMENTARY PHOSPHORUS FROM AN AMAZON FLOODPLAIN LAKE: IMPLICATIONS FOR TOTAL PHOSPHORUS ANALYSIS IN TURBID WATERS.
California Univ., Santa Barbara. Dept. of Biological Sciences.
D. L. Engler, and O. Sarnelle.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 483-490, March 1990. 6 fig, 1 tab, 23 ref.

Descriptors: *Algae, *Amazon River, *Lake sediments, *Phosphorus, *Turbidity, Bioassay, Bioavailability, Cycling nutrients, Laboratory methods, Nutrients, Sediment analysis.

Despite the potential influence of particulate-bound nutrients on the productivity of Amazon floodplain lakes, there is only one study addressing the bioavailability of particulate nutrients in this system. Chemical extraction techniques were coupled with a bioassay experiment to assess the types and amounts of bioavailable P present in the sediments of an Amazon floodplain lake. Chemical forms of P and their availabilities to Selenastrum capricornutum were measured in sediments collected from Lago Calado, an Amazon floodplain lake. Postbioassay analysis confirmed that Selenastrum used ca. 60-70% of the P in the NaOH-extracted fraction during a 9-d incubation. No evidence for algal use of Ca-bound P or organic P was found. Methodological comparisons revealed that persulfate digestion may not adequately recover algal-available particulate P in waters high in organic turbidity. An average of 26% of the algal-available P in Amazon River water was in particulate form. (Author's abstract)

ABIOTIC TRANSFORMATIONS OF IRON AND PHOSPHATE IN HUMIC LAKE WATER REVEALED BY DOUBLE-ISOTOPE LABELING AND GEL FILTRATION.
Limnologisch Inst., Oosterzee (Netherlands). Tjeukemeer Lab.
H. de Haan, R. I. Jones, and K. Salonen.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 491-497, March 1990. 5 fig, 1 tab, 19 ref.

Descriptors: *Chemical interactions, *Humic substances, *Iron, *Lakes, *Limnology, *Phosphates, Chemical complexes, Chromatography, Filtration, Finland, Iron radioisotopes, Laboratory methods, Phosphorus radioisotopes.

Abiotic transformations of Fe and phosphate in humic water from Finnish forest lakes were studied by Sephadex G-100 gel filtration following incubation of filtered (0.2 microns) epilimnetic water samples to which both Fe55Cl3-6H2O and P32O4(-3) had been added. The simultaneous movement of Fe55 and P32 to higher molecular weight fractions (10,000-20,000 MW) depended on the presence of dissolved humic substances (DHS). In the absence of DHS almost all Fe55, probably

as inorganic hydrolyzed iron particles, sorbed to the Sephadex. The binding of Fe55 by DHS was not affected by increasing the natural ionic strength (I = ca. .0003 M) by a factor of 100. In the absence of quasi-equilibrium between free and DHS-bound P32O4(-3), the DHS-Fe-PO4(-3) complex readily released P32O4(-3)-P. Compared to the P32 binding, Fe55 binding was rapid. More than 20% of the Fe had been bound after only 1 min, whereas for labeled PO4(-3) this percentage was reached only after 24 h. (Author's abstract)

The use of fossil diatom assemblages to assist in reconstructing lake history and monitoring environmental change is a well-established procedure, however few studies have examined the variability of diatom assemblages in space and time. Diatom biostratigraphy was analyzed for 10 sediment cores covering a range of water depths in Lough Augher, Northern Ireland. Cores were zoned to permit correlation and transfer of a Pb210 chronology and calculation of diatom accumulation rates. There were clear differences in relative frequency of planktonic microfossils between littoral (< 6-m water depths) and profundal cores, but all cores gave a similar history of the eutrophication of the lake. Deep-water cores, however, provided a clearer and higher resolution record. Diatom concentrations and percentages were horizontally nonuniform, contradicting the assumption that lake and sediment mixing creates homogeneous microfossil assemblages before deposition. Accumulation rates also showed considerable variation over time. Relative accumulation rates indicate that no single core accurately reflects the mean accumulation rate for the whole basin. Before 1900, diatoms were focused into deeper water, but after ca. 1940 the pattern of diatom deposition and accumulation rates began to change. Redistribution of diatoms into the deepest part of the basin was reduced, perhaps due to reduced resuspension from the increasing influence of fringing macrophyte beds. (Author's abstract)

GREIGITE AND THE MAGNETIC PROPERTIES OF SEDIMENTS.
Freshwater Biological Association, Ambleside (England). Windermere Lab.
J. Hilton.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 509-520, March 1990. 7 fig, 1 tab, 29 ref.

Descriptors: *Eutrophic lakes, *Iron compounds, *Lake sediments, *Limnology, *Magnetic studies, *Paleolimnology, Chemical properties, Cores, England, Greigite, Lacustrine environment, Sediment analysis, Sulfides.

Measurements of the properties of magnetic minerals in lacustrine sediments have been used on many occasions to obtain information about relative accumulation rates in lakes and to study changes in erosion patterns in catchments. Data interpretation in such studies requires that an intensity extreme or direction change in one core is contemporary with a similar observation in another core. If magnetic minerals are formed in situ, this assumption could be invalid. X-ray diffraction spectra of freeze-dried sediments from a lake in the English Lake District positively identified the presence of greigite, a magnetic iron sulfide (Fe3S4) mineral. The sediments also show considerable loss of magnetic intensity when wet samples are allowed to oxidize. Several hypotheses have been proposed elsewhere to explain the intensity loss, but an assessment of the evidence suggests that oxidation of greigite is responsible in these sediments. Data from several lakes and from laboratory experiments are used to deduce the environmental requirements for greigite formation. These conditions of high labile C concentrations, good sources of labile Fe and S, and an oscillating oxycline depth in the sediments were likely to be found only in monomictic or dimictic eutrophic lakes, estuaries, and salt marshes and are unlikely to be found in meromictic lakes, unstratified lakes, oligotrophic lakes, or deep-sea sediments. CONTRIBUTION OF ORGANIC ACIDS TO ALKALINITY IN LAKES WITHIN THE MOUNT ST. HELENS BLAST ZONE.
Washington Univ., Seattle. Coll. of Ocean and Fishery Sciences.
R. C. Wissmar, D. M. McKnight, and C. N. Dahm.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 535-542, March 1990. 3 fig, 4 tab, 27 ref. NSF Grants DEB 81-1307 and BSR 84-07429. U.S. Department of Agriculture Forest Service Agreement PNW-80-178.

Descriptors: *Alkalinity, *Geochemistry, *Limnology, *Mount St Helens, *Mountain lakes, *Organic acids, *Volcanoes, Alkaline water, Carbonates, Chemical properties, Chlorides, Dissolved organic carbon, Fulvic acids, Sulfates.

The volcanic eruption of Mount St. Helens in May 1980 severely affected lakes in the surrounding blast zone. Existing and newly formed lakes had high total alkalinities (TA) and concentrations of dissolved organic carbon (DOC). In Spirit Lake, TA and DOC were 36 and 64 times pre-eruption values. Dissolved organic acids, primarily ionized fulvic acids and hydrophilic acids constituted 80-90% of the dissolved organic material. High TA values during 1980 and 1981 included two major components, carbonate (CA) and surplus alkalinity. A comparison of minimal estimates for organic acid alkalinity from ionized fulvic acids and hydrophilic acids with values of surplus showed that the dissociation of organic acids contributed between 20 and 100% to alkalinity in 1980 and 1981. During 1981, surplus alkalinity and organic acid alkalinities relative to TA declined while CA increased. This increase in CA reflected the influence of dilution of lake volumes with runoff waters and a major decrease in organic acids due to dilution and microbial mineralization. CA appeared controlled by contributions of bicarbonate ions due to chemical weathering, possible anionic exchange and microbially mediated reactions. These reactions involving organic acids in combination with the geochemical characteristics of the eruption (e.g. moderate sulfate and chloride concentrations and massive loadings of inorganic and organic materials) led to well-buffered lakes that had a sizable proportion of the alkalinity being contributed by dissociated organic acids. The presence of six cyclic, heptapeptide toxins in floating scums of Microcystis aeruginosa in Hartbeespoort Dam, South Africa, was monitored over 2.5 years. Separation of the six peptide toxins was achieved by reverse phase high pressure liquid chromatography. The six toxins were either not detectable or in very low concentrations during the summer. Combined concentrations of four of the toxins ranged from 5 to 415 micrograms/gram of dry scum and were strongly and positively correlated to primary production per unit of chlorophyll-a, solar radiation, surface water temperature, pH, and percent oxygen saturation ($r=0.52$-0.67, $n=16$-20, $p<0.001$) and weakly, negatively correlated to surface chlorophyll-a and orthophosphate concentrations ($r = -0.33$, $n = 16$-20, $p < 0.05$). No strong relationships were found between total toxin concentrations in scum samples and surface water organic and inorganic nutrient concentrations. The data from the subtropical reservoir indicated that the specific rate of photosynthesis of M. aeruginosa together with several environmental factors is closely coupled to the concentrations of peptide toxins in this cyanobacterium. Descriptors: *Eutrophic lakes, *Lake Teganuma, *Lake sediments, *Limnology, *Population density, *Seasonal variation, *Sulfur bacteria, Japan, Reeds, Sulfates, Water temperature.

Seasonal variations in population density of sulfate-reducing bacteria (SRB) and sulfate reduction rates were examined for sediments of an offshore and reed site of Lake Teganuma (freshwater, hypertrophic), Chiba Prefecture, Japan. The numbers of SRB (colony forming units/ml) in the surface sediments (0-2 cm) were at a level of 100,000 at the reed site and a level of 10,000 at the offshore one, and they remained relatively constant throughout the year. The activities at both sites increased from summer to autumn, and the reed sediments showed higher activities (1.08-16.6 times) than the offshore ones in this period; the maximum rates (September) (nmol/ml/day) in the offshore and reed sediments were 290 in the 0-3 cm layer and 1990 in the 3-6 cm layer. In situ temperature may have greatly affected sulfate reduction. (Author's abstract)

Descriptors: *Acid rain, *Case studies, *Ecosystems, *Lake restoration, *Liming, *Limnology, Adirondack lakes, Chemical interactions, Dissolved organic carbon, Hydrogen ion concentration, Ion exchange, Lakes, Land use, Sphagnum moss, Sulfates, Water chemistry.

A review of the lake chemistry from six lakes studied has identified possible important areas for further investigation. First, weak acids in sediment that titrate the lime added to a lake may represent a potentially important process that requires further quantification. Second, the chemistry and biological processes involving Sphagnum or other ion exchange processes are of interest for assessing the potential importance of ecosystems to contribute strong acids to their watersheds. Third, independent sources of hydrogen and sulfate ions not associated with atmospheric deposition may exist in lakes. Fourth, DOC and pH appear to be positively correlated for the Adirondak lakes studied. Accordingly, if processes have recently acidified these Adirondak lakes, then concentrations of DOC may have been greater in the past. Thus, these Adirondak lakes may have been acidified by organic acids in the past to a greater degree than indicated by present-day water chemistry. A number of possible processes (land use, clear cutting, burning, forestry, and loss of alkaline nutrient substances from watersheds) may play important roles in acidifying surface waters. However, many of these processes are poorly understood and require further research. (Lantz-PTT)

NUTRIENT DYNAMICS IN A FLOATING MAT AND POND SYSTEM WITH SPECIAL REFERENCE TO ITS VEGETATION.
Kyoto Univ. (Japan). Lab. for Plant Ecological Studies.
A. Haraguchi, and K. Matsui.
Ecological Research (Kyoto) ECRSEX, Vol. 5, No. 1, p 63-79, April 1990. 12 fig, 1 tab, 29 ref.

Descriptors: *Cycling nutrients, *Floating plants, *Limnology, *Nutrient transport, *Ponds, *Sphagnum, Floating mat, Hydrogen ion concentration, Peat, Seasonal variation, Vegetation effects.

Chemical properties of waters and their seasonal changes were studied in Mizorogaike Pond, a system of pond and floating mat. The following six sites including contrasting habitats and water conditions were monitored to assess nutrient dynamics in the system: (1) a pool on the mat, (2) margin of a Sphagnum cuspidatum community, (3) an artificial 'well' (water layer beneath the floating mat), (4) a Menyanthes trifoliata community in a hollow, and (5) and (6) two sites in the open water. On the floating mat, the water around the Sphagnum community had lower pH values, while that in the M. trifoliata community had higher pH values. This difference was related to the influence of flood water, the extent of which was determined by the microtopography. Seasonal changes in water chemistry on the mat suggested that pond water flooding the mat in late autumn and winter is important for the nutrient supply to the mat surface vegetation in this system. Water chemistry of the 'well' suggested that the diffusion of inorganic nitrogen occurs from beneath the peat layer. Two types of cluster analysis based on the mean values for chemical variables and the patterns of fluctuation in these variables were performed. The six sites were classified into similar groups which were identified by water type (pool, hollow, well and open water) by both types of analysis. The results showed that a common kind of perturbation should operate in determining the status of nutrient dynamics in the various water types. (Author's abstract)

Descriptors: *Fish populations, *Mangrove swamps, *Population dynamics, *Species diversity, Biomass, Coastal areas, Mexico, Primary productivity, Seasonal variation.

Aquatic primary productivity, mangrove ecology, and fish community dynamics were investigated in the Teacapan-Agua Brava lagoon-estuarine system, the most extensive mangrove ecosystem on the Pacific coast of Mexico with three species of mangroves distributed heterogeneously (Laguncularia racemosa, Rhizophora mangle, and Avicennia germinans). Tree density was 3,203 trees/ha and basal area was 14.0 sq m/ha. Litterfall was 1,417 g/sq m/yr, characteristic of a productive riverine forest. The degradation constant for Laguncularia racemosa leaves varied from 1.71 to 4.7/yr and mean annual net aquatic productivity was 0.41 g C/cu m/d. There were high concentrations of humic substances (up to 150 mg/l) early in the wet season. Seasonal variations of the above parameters seemed closely related to the ecology of fish populations. There were 75 fish species distributed in two principal assemblages associated with wet and dry seasons. Diversity and biomass analysis indicated 18 dominant species. Total biomass of the community in this coastal system was estimated at 10 g wet wt/sq m. The highest biomass occurred in the wet season. The most common fish species were Mugil curema, Achirus mazatlanus, Galeichthys caerulescens, Arius liropus, Diapterus peruvianus, Lile stolifera, Centropomus robalito, and Eucinostomus sp., all of which have fishery importance. Primary productivity and fish community ecology are controlled by habitat characteristics, river discharge, and climatic seasonality. (Author's abstract)

Descriptors: *Biodegradation, *Denitrification, *Eutrophic streams, *Fate of pollutants, *Limnology, *Model studies, *Streams, Chlorophyll, Diffusion, Nitrates, Oxygen, Photosynthesis.

Seasonal variation of chlorophyll content, photosynthesis, O2 respiration, and denitrification was measured under light and dark conditions in the sediment of a nutrient-rich Danish lowland stream. Exponential growth of benthic microalgae was observed in early spring (April-May) and photosynthetic capacity persisted until fall. The benthic algae were a major C source for heterotrophic activity as indicated by a close correlation between O2 respiration and Chl content in the sediment. Denitrification activity was related to Chl content, NO3-availability, and O2 conditions. Diffusion from the overlying water was always the major NO3-source for denitrification. Under lighted conditions, photosynthetic O2 production increased the oxic zone and reduced denitrification activity by up to 85% in spring. A simple diffusion-reaction model allowed denitrification rates to be estimated from O2 respiration rates and concentrations of O2 and NO3(-) in the stream water. Throughout the season, estimated denitrification rates correlated well with those actually measured. The model demonstrated that denitrification activity was controlled primarily by the thickness of the oxic surface layer which served as a diffusion barrier for NO3(-) to the denitrification zone. SEASONAL PATTERNS OF GRAZING AND NUTRIENT LIMITATION OF PHYTOPLANKTON IN A EUTROPHIC LAKE.
Wisconsin Univ.-Madison. Center for Limnology.
M. J. Vanni, and J. Temte.
Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 697-709, May 1990. 3 fig, 3 tab, 24 ref. Federal Aid in Sport Fish Restoration Act Project F-95-P.

Descriptors: *Eutrophic lakes, *Grazing, *Lake Mendota, *Limiting nutrients, *Limnology, *Phytoplankton, Biomass, Daphnia, Nitrogen, Phosphorus, Seasonal variation, Succession, Wisconsin.

Observations and experiments on zooplankton grazing and nutrient (N and P) limitation of phytoplankton of Lake Mendota, Wisconsin, revealed that the relative strength of the two factors varied markedly during the seasonal succession of phytoplankton. Furthermore, seasonal changes in grazing and nutrient limitation were caused not only by seasonal changes in zooplankton community structure and nutrient availability but also by changes in

phytoplankton community structure, which led to changes in edibility to zooplankton. The spring phytoplankton bloom of diatoms and small flagellates was highly vulnerable to grazing by both cyclopoid copepods and Daphnia, although Daphnia had a much stronger effect. Increased Daphnia grazing in late spring resulted in low phytoplankton biomass (the clear-water period) and a phytoplankton community dominated by colonial green algae--taxa vulnerable to grazing by Daphnia but not other zooplankton. Nutrients (N and P) did not limit phytoplankton growth during the spring bloom or the clear-water period. After the clear-water period, the summer phytoplankton community was dominated by blue-greens and Ceratium. Grazing effects by both Daphnia and copepods were low in summer, while nutrient limitation (both N and P) became severe. Reduced grazing impacts in summer may have resulted from prior intense grazing impacts, which led to dominance of grazing-resistant taxa. These results suggest that seasonal variation in the strength of grazing and nutrient controls in eutrophic lakes results from changes in zooplankton biomass and community structure, nutrient availability, and phytoplankton community structure interacting to determine phytoplankton seasonal succession. EPIPHYTIC ALKALINE PHOSPHATASE ON NATURAL AND ARTIFICIAL PLANTS IN AN OLIGOTROPHIC LAKE: RE-EVALUATION OF THE ROLE OF MACROPHYTES AS A PHOSPHORUS SOURCE FOR EPIPHYTES.
North Carolina State Univ. at Raleigh. Dept. of Botany.
J. M. Burkholder, and R. G. Wetzel.
Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 736-747, May 1990. 2 fig, 1 tab, 46 ref.

Descriptors: *Enzymes, *Epiphytes, *Limnology, *Macrophytes, *Oligotrophic lakes, Chlorophyll a, Phosphates.

Alkaline phosphatase activity (APA) and Chl a concentrations of epiphytes were measured from two species of aquatic macrophytes (Potamogeton illinoensis and Scirpus subterminalis) and structurally similar artificial plants in a P-limited lake. The artificial substrata were incubated serially in situ to simulate the age of the natural plant leaves. Throughout the macrophyte growing season, APA per unit of algal Chl on both new and aging leaves was consistently greater for intact epiphytes on artificial plants. This enhancement increased 2-fold to 20-fold (mean 4.5-fold and 7.4-fold for epiphytes from natural and artificial plants) when epiphytes were removed from the plants and suspended before enzymatic assay, exposing more algal cells to the amended PO4(3-) substrate. Comparisons of APA for epiphytes on natural and artificial plants indicated that in this oligotrophic lake, submersed macrophytes were a source of P for epiphytes throughout the growing season and significantly influenced the P metabolism of the microflora. Epiphyte Chl was significantly greater from artificial than from natural plants in 6 of 11 comparisons, however, perhaps indicating a trade-off between improved P availability and some nonbeneficial factor associated with the macrophyte. (Author's abstract)

ANOMALOUS TEMPERATURE AND OXYGEN GRADIENTS UNDER THE ICE OF A HIGH-PLAINS LAKE IN WYOMING.
Wyoming Univ., Laramie. Dept. of Zoology and Physiology.
F. J. Rahel.
Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 751-755, May 1990. 3 fig, 17 ref. NSF Grant BSR 88-07200.

Descriptors: *Density stratification, *Iced lakes, *Limnology, *Mountain lakes, *Oxygen, *Environmental gradient, *Temperature gradient, Gelatt Lake, Wyoming.

Temperatures up to 7.0 C and unusual oxygen profiles were observed under the ice of Gelatt Lake, Wyoming. A layer of warm water near the lake bottom appeared to result from solar heating of bottom sediments. Local increases in the oxygen profile were present in association with a bed of rooted macrophytes (Chara spp.) and a layer of phytoplankton just above bottom. This unusual stratification appeared to be maintained by density differences imposed by a gradient of dissolved solids from surface to bottom. Persistence of a layer of elevated oxygen concentrations, maintained by the stable density stratification, may explain the successful overwintering of fish in this lake. (Author's abstract)

IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 119-128, 5 fig, 4 tab, 14 ref.

Descriptors: *Eutrophication, *Greece, *Lakes, *Limnology, *Water quality, Agricultural runoff, Ammonia, Eutrophic lakes, Mesotrophic lakes, Nitrates, Nutrients, Oligotrophic lakes, Phosphorus, Trophic level.

Recent limnological investigations carried out by the Institute of Inland Waters in Greece provided information on the morphological features of the natural lakes, their physicochemical characteristics and nutrient framework. Water quality, trophic status and the natural background trophic level were evaluated with regard to the water bodies' uses. Based on the available physical, chemical and biological parameters, the Greek lakes could be categorized into: warm, monomictic and deep lakes with oligotrophic to oligomesotrophic and mesoeutrophic conditions mainly affected by nonpoint sources of nutrients; dimictic and shallow lakes with eutrophic to hypertrophic situations due to sewage discharges directly into the basin and oligomesotrophic with natural and agricultural enrichment of their waters; and warm, monomictic and shallow lakes with eutrophic to hypertrophic conditions resulting mainly from agricultural runoffs and point sources of pollution. High concentrations of ammonia, nitrate and phosphate are found in many lakes, while anaerobic hypolimnia are usually encountered in the shallow ones. Phosphorus is the main factor responsible for the eutrophication processes because it is the limiting factor in most examined lakes. The phosphorus, retention coefficient, loading and its permissible level have been also calculated in some of the Greek lakes. The oscillations of the water level, the runoffs from agricultural activities and the wastewater discharges, have an increasing deleterious effect on the water quality and interfere directly with the uses of water, such as fishery, irrigation, and amenities. DECOMPOSITION OF ROOTS IN A SEASONALLY FLOODED SWAMP ECOSYSTEM.
Old Dominion Univ., Norfolk, VA. Dept. of Biological Sciences.
E. G. Tupacz, and F. P. Day.
Aquatic Botany AQBODS, Vol. 37, No. 3, p 199-214, August 1990. 3 fig, 3 tab, 35 ref. NSF Grant BSR-8405222.

Descriptors: *Decomposition, *Great Dismal Swamp, *Roots, *Swamps, *Wetlands, Annual floods, Decay rates, Detritus, Environmental effects, Forests.

Decomposition rates of roots to a depth of 40 cm were estimated by two methods in four plant communities in the periodically flooded Great Dismal Swamp. The community dominants were: (1) Chamaecyparis thyoides; (2) Taxodium distichum; (3) mixed Quercus spp. and (4) Acer rubrum -Nyssa spp. respectively. Modified litter bags and a core method were simultaneously employed on three flooded sites and an unflooded site. Long vertical litter bags were developed to measure root decay over a vertical soil profile with minimal disturbance to the soil. Reciprocal samples (litter from each of the other sites) were placed on each site to examine the effects of litter quality. Roots in the cores exhibited higher decay rates than in the litter bags; rates in the bags ranged from 0.48 to 1.00 mg/g/d and the range for the cores was 1.15-2.74 mg/g/d. The core method was ineffective in estimating decay rates for the >5 mm diameter roots because of high sample variability. Reciprocal samples revealed statistically significant differences between root types, with roots from the mixed Quercus site being most resistant to decay. Just as leaf litter quality has been shown to regulate aboveground decomposition, root quality appears to play a major role in belowground decay. The study also demonstrated the importance of environmental influences since root decay was slowest on the sites (Chamaecyparis and Acer-Nyssa) with the longest duration of soil saturation. Both techniques exhibited slow decay rates with increasing depth. The litter bag technique is the recommended approach; several problems make the core technique a less than satisfactory method. (Author's abstract)

Aquatic Botany AQBODS, Vol. 37, No. 3, p 215-227, August 1990. 3 fig, 4 tab, 45 ref.

Descriptors: *Acid rain effects, *Alkalinity, *Aquatic plants, *Cycling nutrients, *Decomposition, *Hydrogen ion concentration, *Water pollution effects, Acidic water, Bicarbonates, Calcium, Detritus, Lake restoration, Lake sediments, Magnesium, Nitrogen, Organic matter, Phosphorus.

Decomposition experiments were carried out in chemostats, using synthetic media, to investigate the influence of pH, Al and HCO3(-) concentrations on the decomposition and chemical composition of floating leaf material of Nymphaea alba L. Low pH and elevated Al concentrations inhibited decay. High HCO3(-) concentrations stimulated decomposition. N concentration in the detritus increased in all media, but more so in the non-acid treatments. In media containing HCO3(-), Ca and Mg concentration rose in the decaying material. In acid media, these elements disappeared rapidly from the detritus. N and P recycling from the detritus was slower in acid media because of the lower overall decay rate. The low decay rate in acid waters will lead to a slow recycling of nutrients from the decomposing plant material. A relatively large part of the N and P in acid systems will be located in organic matter on the bottom and is therefore not available for primary production. This also has consequences for the restoration of acidified systems with accumulated organic matter deposits. Addition of lime or other acid-neutralizing substances can lead to a sharp increase

in decay rate and a rapid release of N and P from the detritus. Removal of the organic layer from the sediment may be a prerequisite for the restoration of an acidified water to the former oligotrophic situation. (White-Reimer-PTT)

MICRO-ARTHROPOD SEASONALITY IN STREAMS OF VARYING PH.
Queen Mary Coll., London (England). School of Biological Sciences.
S. D. Rundle.
Freshwater Biology FWBLAB, Vol. 24, No. 1, p 1-21, August 1990. 10 fig, 5 tab, 40 ref.

Descriptors: *Acidic water, *Aquatic animals, *Benthic fauna, *England, *Hydrogen ion concentration, *Stream biota, Aluminum, Biological samples, Calcium, Conductivity, Copepods, Population density, Seasonal variation, Species composition, Species diversity, Statistical analysis, Waterfleas, Watermites.

Micro-arthropods were sampled seasonally (January, May, August, and October) during 1986 from ten stony riffle sites on streams in the Ashdown Forest of southern England, using both standard benthic and interstitial samplers. Total densities peaked at most sites in summer. Species richness reached a maximum at acid sites in summer but at circumneutral sites in autumn, when Hydrachnellae and Cladocera were particularly species rich. Individual species showed no obvious differences in seasonality between sites; the majority peaking in summer or autumn, regardless of pH. However, cyclopoid copepods were particularly numerous at acid sites in summer, a pattern not observed at circumneutral sites. Multivariate ordination and classification of data sets from the separate seasons, and all four seasons combined, showed that mean site pH, conductivity, and aluminum and calcium concentrations were the most important variables explaining between-site variation in species composition. This clear distinction between the community structure at acidic and circumneutral sites was evident in all seasons except winter. Species composition was also more predictable throughout the year at low-pH sites. A number of species were taken consistently in interstitial samples and the cyclopoids Diacyclops languidus and D. languidiodes were restricted to the hyporheos at circumneutral sites. The similar faunal composition of the hyporheos and the epibenthos indicated that the separation of these communities was not well defined in Ashdown Forest streams. (Author's abstract)

REFUGE AVAILABILITY: A KEY TO UNDERSTANDING THE SUMMER DISAPPEARANCE OF DAPHNIA.
Minnesota Univ., Minneapolis. Limnological Research Center.
D. Wright, and J. Shapiro.
Freshwater Biology FWBLAB, Vol. 24, No. 1, p 43-62, August 1990. 9 fig, 1 tab, 64 ref.

Descriptors: *Animal behavior, *Daphnia, *Lake ecology, *Limnology, *Predation, *Waterfleas, *Zooplankton, Community structure, Dissolved oxygen, Fish, Light quality, Mortality, Natality, Refuge availability, Seasonal variation, Temperature.

The mid-summer declines of Daphnia species in three small lakes were investigated to examine the relative roles of reduced natality and increased mortality. Reduced natality (assessed by quantifying clutch size, lipid index, and available food) could not account for the decline in daphnid abundance in any of the populations examined. The role of increased mortality imposed by zooplanktivorous fish was assessed by estimating the sizes of the mid-water refuge areas where daphnids could escape fish predation. Mid-water refugia can be formed in lakes in either of two ways. (1) A physical or chemical gradient (e.g., temperature or dissolved oxygen) might act by restricting the vertical distribution of the predator so that spatial separation between predator and prey populations occurs. (2) Alternatively, a gradient in light intensity or cover density could act by reducing the rate of predation where overlap of the populations does occur. The boundaries of the refuge areas were estimated from field measurements and literature values and were based on gradients of temperature, dissolved oxygen and light. Observed decreases in refuge thicknesses correlated well with the mid-summer declines of large-bodied Daphnia species in all three lakes. Intermediate-sized daphnids were less affected as the refuges thinned and small-bodied species increased in abundance. The importance of refuge thickness in modifying zooplanktivore-induced mortality was further tested in large enclosures where refuge thickness was experimentally modified. In the presence of zooplanktivorous fish, large-bodied Daphnia, which used the refuge, persisted when the refuge was thick but disappeared when it thinned. Daphnia galeata mendotae, which did not occupy the refuge zone, was rapidly eliminated regardless of refuge thickness. It was concluded that refuge availability plays a major role in Daphnia population dynamics. (White-Reimer-PTT)

MODELLING BLACK FLY PRODUCTION DYNAMICS IN BLACKWATER STREAMS.
Alabama Univ., University. Aquatic Biology Program.
A. C. Benke, and K. A. Parsons.
Freshwater Biology FWBLAB, Vol. 24, No. 1, p 167-180, August 1990. 7 fig, 3 tab, 37 ref. NSF (DEB-8104427, BSR-8406630, BSR-8705745).

Descriptors: *Aquatic insects, *Black flies, *Georgia, *Model studies, *Population dynamics, *Productivity, *Stream ecology, Biomass, Black Creek, Flooding, Habitats, Hydrographs, Ogeechee River, Satilla River, Snags, Temperature.

Two predictive models were employed along with intensive field sampling to estimate production of black flies (Simulum spp.) on snags (submerged wood) in three blackwater streams on the Georgia Coastal Plain of the Southeastern U.S. One model predicts daily growth rate from temperature and hydrograph pattern; the other predicts habitat abundance (of snags) from river height. In the sixth order Ogeechee River, annual production was twice as high in 1982 (7.1 g dry mass(=DM)/sq m) as in 1983 (3.6 g DM/sq m). When converted to production per sq m of river bottom, values were 35-40% of the snag surface estimates. Annual production was much lower in fourth order Black Creek (1982, 1.3 g DM/sq m of snag surface) and much higher in the sixth order Satilla River (1975, 15.6-40.0 g DM/sq m). There was a distinct bimodal pattern of black fly production in the Ogeechee River in both years, with peaks occurring in winter and summer. Similar bimodal patterns of production were found in Black Creek and in the Satilla River. Although there appears to be an intrinsic component to the bimodal pattern, production peaks (growth rate and biomass) appear to be associated with initial stages of flooding. Annual production/biomass ratios (37-85) are the highest reported for black fly populations. The variation of annual P/B ratios among sites was more strongly dependent on the temporal distribution of standing stock biomass than on differences in growth rates. Variation in production among sites appears to be due to differences in current velocity, hydrograph variability, and abundance of coexisting consumers. (Author's abstract)

STONEFLY PREDATION ALONG A HYDRAULIC GRADIENT: A FIELD TEST OF THE HARSH--BENIGN HYPOTHESIS.
Cornell Univ., Ithaca, NY. Dept. of Entomology.
B. L. Peckarsky, S. C. Horn, and B. Statzner.
Freshwater Biology FWBLAB, Vol. 24, No. 1, p 181-191, August 1990. 5 fig, 3 tab, 39 ref. NSF Grant BSR86-04921.

Descriptors: *Aquatic insects, *Environmental gradient, *Germany, *Predation, *Stoneflies, *Stream ecology, Black Forest, Environmental effects, Hydraulic regime, Mayflies, Midges, Population dynamics.

Microhabitat preferences of predatory stoneflies and four prey taxa were assessed by taking benthic samples along a hydraulic gradient in a Black Forest stream in West Germany. Densities of pred-

ator and prey species were estimated at twenty-one hydraulic regimes. Enclosures containing the stonefly, Dinocras cephalotes, and control cages with no predators were placed in the substrate at hydraulic regimes favorable and unfavorable to predators. Cages received initial prey communities that were obtained from benthic samples taken at hydraulic regimes matching those intended for each cage. Population densities of the two most numerically important prey taxa, the mayfly, Baetis rhodani, and the Chironomidae, were reduced in the presence of Dinocras, but only when enclosures were placed in the hydraulic regimes favorable to the predator. Thus, predation effects increased as the hydraulic regime became more benign to the predators. Densities of two other prey species rare in the diets of Dinocras (Hydropsyche instabilis and Gammarus fossarum) were generally unaffected by predators regardless of the hydraulic regime. These data provide support for the hypothesis that perception of the abiotic regime as harsh or benign to predators is a good predictor of predator impact in densities of preferred prey species. In harsher abiotic regimes, impact will be low, while impact will be high in benign abiotic regimes. (Author's abstract)

MOST DILUTE LAKE IN THE WORLD.
E and S Environmental Chemistry, Inc., Corvallis, OR.
J. M. Eilers, T. J. Sullivan, and K. C. Hurley.
Hydrobiologia HYDRB8, Vol. 199, No. 1, p 1-6, July 17, 1990. 3 tab, 25 ref. EPA contract No. 69-03-3246.

Descriptors: *Acid rain, *Chemistry of precipitation, *Conductivity, *Limnology, *Oligotrophic lakes, *Oregon, *Weathering, Base cations, Cascade Mountains, Dilute lakes, Lake Notasha, Monitoring.

Lake Notasha, near the crest of the Oregon Cascade mountain range, is the most dilute lake known. The measured conductivity during two visits was 1.3 and 1.6 microS/cm, with a sum of base cations of 9 and 18 microeq/L; bicarbonate was the dominant anion. Most of the cations in the lake can be accounted for by evapoconcentration of precipitation, although input of weathering products cannot be excluded as a source. The topographic watershed has a mixed coniferous forest, but the physical setting of the lake apparently minimizes hydrologic and ionic contributions from the watershed. This makes lakes such as Notasha appropriate receptors for monitoring acidic and other atmospheric contaminants. (Author's abstract)

ASSOCIATIONS OF AQUATIC INSECTS (EPHEMEROPTERA, PLECOPTERA, AND TRICHOPTERA) IN A NETWORK OF SUBARCTIC LAKES AND STREAMS IN QUEBEC.
Montreal Univ. (Quebec). Dept. of Biological Sciences.
P. P. Harper.
Hydrobiologia HYDRB8, Vol. 199, No. 1, p 43-64, July 17, 1990. 5 fig, 5 tab, 35 ref.

Descriptors: *Aquatic insects, *Caddisflies, *Lake ecology, *Limnology, *Mayflies, *Quebec, *Stoneflies, *Stream ecology, Canada, Environmental impact, Habitats, Hydroelectric power, Monitoring, Seasonal variation, Species diversity, Succession.

As part of an impact assessment of large hydroelectric projects in the James Bay drainage in Northwestern Quebec, the aquatic insect communities were studied in a network of rivers, lakes and streams during the summer of 1975. Thirty-eight emergence traps operated over the ice-free season yielded 10,888 insects (5,509 Ephemeroptera, 2,817 Plecoptera, and 2,512 Trichoptera), representing 148 species (respectively 44, 18, and 86), most of temperate and boreal affinities. There was no arctic element. Similarity analyses and clustering procedures on the emergence series revealed the existence of distinct insect communities in the river (fast and slow sections), the streams (fast and slow), the lakes and the bogs; each characterized by a particular assemblage of species. Many of the species were more or less ubiquitous and differences between communities were marked more by changes in the dominance of the species and differences in the frequency distributions, than absolute shifts in the species lists. The yields in the traps set in fast water were much greater than those in slow running water, and these in turn greater than those of standing water. By comparison with more southerly sites, the seasonal succession of species was retarded in the spring and early summer, but was not shortened appreciably in the fall. The usual emergence patterns associated with these taxa was observed, namely those of spring, summer and autumn species. (Author's abstract)

OCCURRENCE OF LIMNIC MICRO-CRUSTACEANS IN RELATION TO PH AND HUMIC CONTENT IN SWEDISH WATER BODIES.
Uppsala Univ. (Sweden). Limnologiska Institutionen.
B. Berzins, and J. Bertilsson.
Hydrobiologia HYDRB8, Vol. 199, No. 1, p 65-71, July 17, 1990. 5 fig, 13 ref.

Descriptors: *Acid rain effects, *Crustaceans, *Data collections, *Humic acids, *Hydrogen ion concentration, *Plankton, *Sweden, Correlation analysis, Data interpretation, Rotifers, Species distribution, Waterfleas.

A large quantity of planktonic and semiplanktonic microcrustacean data collected from a variety of waters in south and central Sweden was computerized. The more frequent species were listed according to pH and humic acid (measured by color as Pt/L) preference. Species indicative of oligotrophic conditions were most abundant just below the neutral pH point (5.5), eurytropic species at a similarly neutral pH, and the eutrophic species Daphnia cucullata and D. magna were positively correlated with higher pH levels (8.0). No extreme pH preferences were observed. No correlation was found between humic acid and trophic level. In most cases planktonic species occurred at lower humic acid levels and semiplanktonic species at higher levels. Rotifers were distributed over the widest pH range. (White-Reimer-PTT)

ACCUMULATION OF SCANDIUM IN THE SHOOTS OF AQUATIC BRYOPHYTES IN ACID WATER.
National Inst. for Environmental Studies, Ibaraki (Japan).
K. Satke, and M. Nishikawa.
Hydrobiologia HYDRB8, Vol. 199, No. 3, p 173-177, July 31, 1990. 1 fig, 2 tab, 17 ref.

Descriptors: *Acidic water, *Aluminum, *Aquatic plants, *Bioaccumulation, *Bioindicators, *Bryophytes, *Scandium, *Trace metals, Chile, England, Hydrogen ion concentration, Inductively coupled plasma, Japan, New Caladonia, Solubility.

The content of scandium (Sc) was determined using inductively coupled plasma in the shoots of eighteen species of aquatic bryophytes collected from thirty-five freshwater sites (rivers, streams, lakes, and springs) located in Chile, England, Japan, and New Caladonia. The shoots of aquatic bryophytes were found to accumulate scandium in acid water, attaining a level of 33 microg/g in Scapania undulata in an acid stream with a pH of about 4.2. The content of scandium was highly correlated with that of aluminum in the shoots of S. undulata ($r=0.986, 0.967$; $p < 0.01$). The increase in Sc and Al in the basal shoot corresponded to the time of contact with the stream water. Little is known about the behavior of Sc in natural fresh water, but it is recognized that the value of the acid-base equilibrium coefficient of the aquoscandium ion in water is similar to that of the aquoaluminum ion which has a higher solubility in acid water than in non-acid water. The results demonstrated the accumulation of Sc by S. undulata and Jungermannia vulcanicola in acid water. However, the details of Sc accumulation by other aquatic bryophytes and the differences between the accumulation of Sc and Al in acid waters were not apparent. (White-Reimer-PTT)

SEASONAL CHANGES IN THE DISSOLVED FREE AMINO ACID AND DOC CONCENTRATIONS IN A HYPERTROPHIC AFRICAN RESERVOIR AND ITS INFLOWING RIVERS.
Council for Scientific and Industrial Research, Pretoria (South Africa). Div. of Water Technology.
R. D. Robarts, R. J. Wicks, and R. Gehr.
Hydrobiologia HYDRB8, Vol. 199, No. 3, p 201-216, July 31, 1990. 8 fig, 3 tab, 35 ref.

Descriptors: *Amino acids, *Dissolved organic carbon, *Eutrophication, *Reservoirs, *South Africa, Aquatic bacteria, Correlation analysis, Depth, Flow, Influent streams, Rivers, Seasonal variation.

While dissolved free amino acids (DFAA) in marine and fresh waters typically make up only a minor portion (0.1 to 0.5%) of the total pool of dissolved organic carbon (DOC), free amino acids can be important intermediaries in the flux of carbon in lakes. DFAA concentration and composition and DOC concentration were measured over 16 months at three depths in hypertrophic Hartbeespoort Dam, South Africa and its two perennially inflowing rivers. The range of DFAA concentrations in the reservoir and both rivers were similar with dominant DFAA consisting of serine, glycine, alanine and ornithine in all three systems. The range of DOC concentrations in the rivers was 1.5-11.1 mg/L, the major river (Crocodile) had about twice the DOC concentration of the Magalies River. The DFAA/DOC ratios ranged between 0.02-1.1% in the Crocodile River and 0.13-3.7% in the Magalies River. DFAA and DOC concentrations were positively correlated to the Magalies River flow, but for the Crocodile River, which received domestic and industrial effluents, DOC was inversely correlated to flow. The source of DFAA in both rivers was mainly terrestrial, in contrast to the main DOC source in the Crocodile River which was the effluents. The DFAA load of the Crocodile River ranged between 0.22 and 208 kg C/d. DOC (5.0-24.8 mg/L) in Hartbeespoort Dam generally decreased with depth but DFAA (15-4800 nmmol/L) concentration showed no clear trend. The DFAA/DOC ratios varied between 0.02 and 2.9%. DFAA concentrations were correlated with bacterial numbers at 0 and 10 m only, while no significant correlations were found with bacterial production at any depth. The rate of bacterial utilization of DFAA was low compared with data from other lakes. Diurnal phytoplankton production of DFAA in the euphotic zone of the whole lake was calculated to vary between 268 and 30,780 t C/d indicating autochthonous DFAA sources were dominant to allochthonous DFAA sources. The autochthonous production of DFAA was >2 x gross bacterial production of the euphotic zone indicating that although DFAA concentrations were frequently < 10 microg C/L, the rate of DFAA production exceeded bacterial requirements. ECOLOGICAL RELATIONSHIPS OF WILD RICE, ZIZANIA AQUATICA. 9. PRODUCTION IN ORGANIC-FLOCCULENT SEDIMENTS.
Lakehead Univ., Thunder Bay (Ontario). Dept. of Biology.
W. R. Day, and P. F. Lee.
Canadian Journal of Botany CJBOAW, Vol. 68, No. 7, p 1542-1548, July 1990. 6 fig, 2 tab, 19 ref.

Descriptors: *Ecosystems, *Limnology, *Organic matter, *Tag Lake, *Wild rice, Beavero Lake, Collins Lake, Comparison studies, No-Name Lake, Ontario.

Seasonal chemical trends and wild rice production were examined in unproductive organic-flocculent sediments from three lakes: Collins Lake, No-Name Lake, and Tag Lake, Ontario. Variations occurred in the level of organic matter and nutrient concentrations among these lakes. However, these among-lake variations were not as distinct as the differences that occurred between these lakes and a productive wild rice lake, Beavero Lake. Cluster analysis shows the interrelationships of the sediment variables in the three flocculent lakes. The sharpest change in the similarity index occurred after a value of 5, at which point five separate clusters could be defined: cluster 1, pH, P; cluster 2, BD, Fe; cluster 3, Zn, Cu; cluster 4, N, Ca; cluster 5, Mn, K, LOI, and Mg. The variation in the nutrient content between Beavero and the organic-flocculent lakes may reflect the origin of the organic material present in the two types of sediments. Detrital material within sediments acts as a source of nutrients that increase with microbial decomposition, adsorption, deposition, and mineralization of organic matter. Much of the organic matter within organic-flocculent sediments is believed to be peat detritus derived from the surrounding peat bogs and may be classified as sedimentary peat. Sediments derived from p eats tend to be resistant to decay and have low bacterial and nutrient content. Macrophytes, algae, and straw, on the other hand, decompose at a faster rate than peat, are likely the major source of sediment in Beavero Lake, and result in the generally higher nutrient levels present in the lake. Nitrogen concentrations were lower in Beavero sediments, but these were likely the result of cumulative nutrient depletion caused by years of wild rice cropping. Sediment density may also affect the release of nutrients from the sediments and accounts for some of the variations between the two types of sediment. (Lantz-PTT)

WETLAND IDENTIFICATION: A MEANS TO PREVENT POTENTIAL PUBLIC HEALTH PROBLEMS.
Enviram Environmental Consultants, Middlesex, NJ.
A. V. Agovino.
Journal of Environmental Health JEVHAH, Vol. 52, No. 5, p 280-281, March/April 1990. 14 ref.

Descriptors: *Classification, *Environmental protection, *Public health, *Water pollution control, *Wetlands, Hydrologic properties, Soil properties, Vegetation.

Development pressures across the nation, especially in the Northeast, have focused public attention on the protection and preservation of wetlands. Encroachment upon wetlands threatens a valuable natural resource, while the installation of on-site sewage disposal systems in soils with certain hydric characteristics may adversely affect public health. Although most health departments are not responsible for enforcing regulations related to wetlands, an understanding of wetlands and their characteristics will help the sanitarian or environmental health specialist, who is reviewing site development applications, to anticipate and eliminate potential problems before they occur. Wetlands are the most productive of habitats and are one of the most rapidly disappearing, with thousands of acres lost annually to filling related to development. Wetlands may be delineated using the multi-parameter approach employed by the Army Corps of Engineers and other federal agencies. This method requires that the following three parameters be assessed at individual points along the wetland/upland boundary: (1) vegetation; (2) soil; and (3) hydrology. The sanitarian who has knowledge and experience in soils and site evaluation can become a vital part of the growing effort to protect these ecosystems and can concurrently assist in the provision of safe treatment and disposal of sewage through proper siting of the septic systems. (Lantz-PTT)

COLONIZATION PROCESS OF A TYPICAL EPILITHIC ALGAL COMMUNITY--HOMOEOTHRIX JANTHINA-ACHNANTHES JAPONICA COMMUNITY--IN A LESS POLLUTED RIVER IN JAPAN (IN JAPANESE).
S. Tanaka, and T. Watanabe.
Japanese Journal of Phycology JJPHDP, Vol. 38, No. 2, p 167-177, June 20, 1990. 8 fig, 14 ref. English summary.

Descriptors: *Algae, *Cyanophyta, *Diatoms, *Japan, *Species composition, Ecosystems, Flow pattern, Model studies, Seasonal variation.

The Homoeothrix janthina (blue-green alga)-Achnanthes japonica (diatom) community is a typical epilithic algal community in less polluted rivers in Japan in all seasons except winter. The community development process was studied using substrates placed on the river bed of the River Takami. The study was conducted during the autumn and winter seasons and the transition between the two seasons in order to determine the effects of different water currents. The data indicated that the increase of Achnanthes japonica was caused by the decrease in water velocity near the surface of the substrate on which many trichomes of Homoeothrix janthina grew. A colonization model was also used to explain the change in dominant species and community structure. The model results indicated that the colonization of periphyton in less polluted rivers developed from a two-dimensional structure consisting of diatoms belonging to the prostrate type, sliding type, and upright type to a three-dimensional structure with both diatoms and blue-green algae. POTENTIAL CHANGES IN THERMAL STRUCTURE AND CYCLE OF LAKE MICHIGAN DUE TO GLOBAL WARMING.
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
M. J. McCormick.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 183-194, March 1990. 6 fig, 2 tab, 24 ref.

Descriptors: *Climatic changes, *Climatology, *Global warming, *Lake Michigan, *Limnology, *Model studies, *Temperature effects, Circulation patterns, Mixing, Seasonal variation, Sensitivity analysis, Stratification, Thermocline, Wind velocity.

A one-dimensional numerical model was used to estimate the present and possible future temperature structures in Lake Michigan. The estimates were based on model output from simulations of the 1981-1984 offshore temperature field. Three scenarios based on general circulation models in which atmospheric CO2 was doubled were used. The models were those of the Goddard Institute for Space Studies (GISS), the Geophysical Fluid Dynamics Laboratory (GJDL), and the Oregon

State University (OSU). In general, simulations based on these three scenarios suggested that winter and summer heat contents of the lake would be higher than at present; the summer increase would be less than that in winter. The higher winter heat content would cause an earlier onset of full thermal stratification, and the season of stratification would increase by up to two months. The earlier onset of stratification, coupled with little change in the wind stress pattern, would yield stronger stratification and less energy for large-scale vertical mixing. The GISS and GFDL scenarios suggest that the lake may not fully turn over in most winters, so a permanent thermocline may form in the deeper regions of Lake Michigan, below the shallow seasonal thermocline. Should future wind speeds be reduced from those used in the study, sensitivity analyses suggest that the true effect on the annual thermal cycle and structure may be underestimated. Furthermore, given all of the uncertainties surrounding estimates of future climate, these results are best viewed as a sensitivity study, wherein the scales selected for the sensitivity tests are based on the different circulation model scenarios. (Author's abstract)

THERMAL STRUCTURE OF THE LOWER GREAT LAKES IN A WARM YEAR: IMPLICATIONS FOR THE OCCURRENCE OF HYPOLIMNION ANOXIA.
National Water Research Inst., Burlington (Ontario).
W. M. Schertzer, and A. M. Sawchuk.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 195-209, March 1990. 11 fig, 1 tab, 46 ref.

Descriptors: *Anoxic conditions, *Climatology, *Global warming, *Great Lakes, *Hypolimnion, *Limnology, *Temperature effects, *Thermal stratification, Heat flux, Seasonal variation, Thermocline.

Surface heat flux, thermal structure and dissolved oxygen concentrations for the lower Great Lakes were examined for an anomalously warm year, 1983. The year was characterized by large reductions in surface heat losses in winter and above-average surface heat flux gains in summer. On an annual basis, the lakes buffered large surface heat gains in summer months through losses in other months. Observations indicated higher surface water temperatures, significant reductions in duration and extent of ice cover, and an earlier disappearance of the 4 C isotherm, signalling an earlier start to thermal stratification. In response to greater surface heating and low wind conditions, the thermocline formed higher in the water column, and stratification lasted longer than in other years. These conditions contributed to slight hypolimnetic anoxia in the central basin of Lake Erie in the latter half of September. A changed duration and distribution of thermal stratification during warm years has important consequences for water quality issues such as development of hypolimnetic anoxia. Based on conditions in 1983, anoxia may still occur in a warmer climate and factors such as duration of stratification, in addition to thermocline position, may become increasingly important for assessments of anoxia in susceptible lakes. (White-Reimer-PTT)

EFFECTS OF CLIMATE WARMING ON DISSOLVED OXYGEN CONCENTRATIONS IN LAKE ERIE.
HydroQual, Inc., Mahwah, NJ.
A. F. Blumberg, and D. M. Di Toro.
Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 210-223, March 1990. 9 fig, 2 tab, 33 ref. EPA Contract 68-01-7288.

Descriptors: *Climatic changes, *Climatology, *Dissolved oxygen, *Global warming, *Lake Erie, *Limnology, *Model studies, *Temperature effects, Anoxic conditions, Great Lakes, Mass balance, Stratification, Thermocline, Water circulation, Water quality.

A coupled hydrodynamic and water quality model was used to examine the response of dissolved oxygen concentrations to warming of the central basin of Lake Erie. An area-averaged hydrodynamic model was used to estimate the lake temperatures and thermocline variability as forced by surface heating and winds. Vertical turbulence mixing processes were incorporated by a second-moment, turbulence closure submodel. The water quality model comprised a set of 15 mass balance equations that predicted distributions of phytoplankton biomass, nutrient concentration, and dissolved oxygen. A synthesis of the results from the coupled model forced by climate warming scenarios from three atmospheric general circulation models suggested that there will be a substantial decline in oxygen concentrations in the central basin. Although forecasts of future conditions that are beyond established experiences are uncertain, it appears likely that climate warming will lead to such a decline regardless of details in changes of lake stratification dynamics. Losses of 1 mg/L of dissolved oxygen in the upper layers and of 1-2 mg/L in the lower layers of Lake Erie's central basin can be expected, along with an increase in the area of the lake that is anoxic. The decline in dissolved oxygen is predicted to be due to warmer lake temperatures, which increase the rate of bacterial activity in the hypolimnion waters and sediment, rather than to thermocline location and volume of water below the thermocline. (Author's abstract)

Transactions of the American Fisheries Society TAFSAI, Vol. 119, No. 2, p 276-281, March 1990. 4 fig, 21 ref, append.

Descriptors: *Air temperature, *Black bass, *Fish populations, *Global warming, *North America, *Temperature effects, Climates, Climatic data, Correlation analysis, Distribution, Growth, Model studies, Thermal effects.

The relationship between air temperature and growth for geographically disparate populations of largemouth bass Micropterus salmoides were examined by using published data in conjunction with climatological records. The thermal component of climate best correlated with growth was accumulated day-degrees over 10 C. This measure of climate was suggested by a simple model in which growth rate is proportional to temperature in excess of 10 C. Correlations (0.79-0.84) between total mean lengths each year (years 3-8) and accumulated day-degrees were significant, and indicated that more than half the variability in growth may be attributed to environmental temperature. Theoretical growth curves reconstructed from these regression lines agreed well with those observed for natural populations. In addition to affecting growth rates, climate warming will extend the ranges of warmwater species northward. It has been suggested that the 18 C July isotherm may delineate the northern boundary of the range of several species, including largemouth bass. (Author's abstract)

GAS TRANSFER VELOCITIES IN LAKES MEASURED WITH SF6.
University of East Anglia, Norwich (England). School of Environmental Sciences.
R. C. Upstill-Goddard, A. J. Watson, P. S. Liss, and M. I. Liddocoat.
Tellus TELLAL, Vol. 42B, No. 4, p 364-377, September 1990. 8 fig, 2 tab, 49 ref.

Descriptors: *Air-water interfaces, *England, *Gas transfer velocity, *Lakes, *Limnology, *Wind velocity, Data interpretation, Physical properties, Water circulation, Wind, Wind-driven currents.

The experimentally-determined relationships between air-water gas transfer velocity and windspeed were examined for two small, rapidly wind mixed lakes in upland southwest England. High-precision estimates of the gas transfer velocity with daily resolution, were derived by monitoring the rate of evasion from the lakes of added sulfur hexafluoride, SF6, an inert, sparingly soluble, man-made gaseous tracer. Corresponding data on in situ wind speeds and directions, and surface water temperatures were automatically logged as a time series of 4 minute averages, using a battery-powered device. The results significantly extend the existing field database and show a strong dependence of gas transfer velocity, normalized to CO2 at 20 C, on windspeed in the range of about 2-13 m/second, corrected to a height of 10 m. No correlation was found between gas transfer velocity and wind direction. The data are fitted with two least-squares straight lines which intersect at a windspeed of 9.5 +/-3 m/second, beyond which significant steepening of the gas transfer velocity versus windspeed relationship implies a transition from the rough surface to breaking wave regime. This finding is in broad agreement with previous conclusions. Nevertheless, the data scatter about the fitted lines exceeds that which would be predicted from the associated analytical uncertainties. This implies the observed relationships between gas transfer velocities and windspeed are not unique, and therefore, that additional factors must be important in determining gas transfer velocities. PREDICTION OF PHOSPHATE COPRECIPITATION WITH CALCITE IN FRESHWATERS.
Freshwater Biological Association, Wareham (England). River Lab.
W. A. House.
Water Research WATRAG, Vol. 24, No. 8, p 1017-1023, August 1990. 3 fig, 3 tab, 29 ref.

Descriptors: *Calcite, *Chemical properties, *Lakes, *Limnology, *Nutrients, *Phosphates, *Precipitation, Chemical interactions, Chemical reactions, Coprecipitation, Epilimnion, Hydrogen ion concentration.

In lakes the coprecipitation of phosphorus is an important self-cleaning mechanism and can result in the removal of as much as 97% of the phosphorus from the epilimnion. It is estimated that about 35% of the total phosphorus removal from the epilimnion of a lake could be coprecipitated with calcite. The coprecipitation reaction is caused by the interaction between inorganic phosphorus and the calcite surface during crystal growth, followed by the incorporation of some of the surface phosphorus into the bulk structure as growth occurs. The application of a model to describe inorganic phosphate coprecipitation with calcite in freshwaters was investigated. An approximate form of the coprecipitation equation was developed and tested using data from studies of the coprecipitation kinetics in different river waters. The results indicate that within certain pH limits and phosphate concentration, the simplified equation describes the adsorption function and hence coprecipitation behavior reasonably well (within 10% of the value obtained using the full form of the coprecipitation equation). When the adsorption function is not significantly changed during the coprecipitation reaction, the phosphate coprecipitation rate is linearly related to the calcite precipitation rate. (Mertz-PTT)

Descriptors: *Acid rain effects, *Adirondack Mountains, *Cores, *Lake sediments, *Limnology, *Metals, *New York, *Paleolimnology, *Sediment chemistry, Acid lakes, Aluminum, Biochemistry, Deposition, Diatoms, Geochemical cycles, Iron, Lead, Manganese, Watersheds, Zinc.

Metal deposition patterns have been examined in sediment cores from three lakes in the Adirondack region of New York as part of the Paleoecological Investigation of Recent Lake Acidification (PIRLA) project. Sequential chemical extraction of Al, Fe, Mn, Pb, and Zn has yielded information on their chemical nature and potential mechanisms involved in their deposition. Results indicate historical changes in watershed chemistry may have influenced metal chemistry in these lakes. Detailed descriptions of the chemical forms of metals in sediments is not possible due to the fact that extraction methods are only operational. However, in two systems known to have been acidified in recent time by acidic deposition, concentrations of labile Al increase after 1940-1950, corresponding with lake acidification as inferred from diatom assemblages. Temporal trends in the inputs of Pb in the Cl-C4 fraction are also consistent with known historical changes in atmospheric Pb inputs to the region. Chemical stratigraphies of Fe and Mn are most likely dominated by internal biogeochemical cycling within sediments. (See W91-01498, W91-01499, W91-01501, and W91-01502) (Author's abstract)

CALCULATION AND UNCERTAINTY ANALYSIS OF PB210 DATES FOR PIRLA PROJECT LAKE SEDIMENT CORES.
Harvard Univ., Cambridge, MA. Dept. of Landscape Architecture.
M. W. Binford.
Journal of Paleolimnology JOUPE8, Vol. 3, No. 3, p 253-267, 1990. 5 fig, 3 tab, 24 ref. Electric Power Research Institute fund RP-2174-10.

Descriptors: *Acid rain, *Error analysis, *Florida, *Lake sediments, *Lead radioisotopes, *Limnology, *Paleolimnology, *Radioactive dating, Acid lakes, Cores, Diatoms, Mathematical models, Metals, Monte Carlo method, Radioactivity, Uncertainty.

Lead-210 assay and dating are subject to several sources of error, including natural variation, the statistical nature of measuring radioactivity, and estimation of the supported fraction. These measurable errors are considered in calculating confidence intervals for Pb-210 dates. Several sources of error, including the effect of blunders or misapplication of the mathematical model, are not included in the quantitative analysis. First-order error analysis and Monte Carlo simulation of cores from Florida Paleoecological Investigation of Recent Lake Acidification (PIRLA) project lakes were used as independent estimates of dating uncertainty. It was found that constant-rate-of-supply (CRS) model dates average less than 1% older than Monte Carlo median dates, but the difference increases nonlinearly with age to a maximum of 11% at 160 years. First-order errors increase exponentially with calculated CRS model dates, with the largest 95% confidence interval in the bottommost datable section being 155 (+ or -) 90 years, and the smallest being 128 (+ or -) 8 years. Monte Carlo intervals also increase exponentially with age, but the largest 95% occurrence interval is 152 (+ or -) 44 years. Confidence intervals calculated by first-order methods and ranges of Monte Carlo dates agree fairly well until the Pb-210 date is about 130 years old. Older dates are unreliable because of this divergence. (See W91-01498 thru W91-01500 and W91-01502) (Author's abstract)

UTILITY OF SCALED CHRYSOPHYTES FOR INFERRING LAKEWATER PH IN NORTHERN NEW ENGLAND LAKES.
Queen's Univ., Kingston (Ontario). Dept. of Biology.
S. S. Dixit, J. P. Smol, D. S. Anderson, and R. B. Davis.
Journal of Paleolimnology JOUPE8, Vol. 3, No. 3, p 269-286, 1990. 7 fig, 6 tab, 74 ref. Electric Power Research Institute fund RP-2170-10; NSF Grant DEB7810641.

Descriptors: *Acid lakes, *Acid rain effects, *Chrysophyta, *Hydrogen ion concentration, *Lake acidification, *Limnology, *New England, *Paleolimnology, *Zooplankton, Biological studies, Correlation analysis, Model studies, Sediment analysis, Stratigraphy.

As part of the Paleoecological Investigation of Recent Lake Acidification (PIRLA) project, scaled chrysophytes in the surface sediments of 58 soft-water northern New England lakes were analyzed to assess their usefulness for inferring pH. The distributions of many taxa were correlated with lakewater pH and associated variables. Canonical correspondence analysis (CCA) and clustering allowed chrysophyte taxa to be grouped according to their distributions along the pH gradient. For example, Chrysodidymus synuroideus, Mallomonas hindonii, and M. hamata commonly occur in acidic water (pH<5.5), whereas M. caudata and M. pseudocoronata are common in circumneutral to alkaline waters. Of the five predictive models developed to infer pH, CCA-based calibration had the lowest standard error (0.35 pH units). A CCA-based predictive model was also developed to infer total alkalinity. There is strong evidence that, in the absence of past measured pH data, stratigraphic studies of sedimentary chrysophyte scales will provide accurate reconstructions of pH in northern New England lakes. ANNUAL STONEFLY (PLECOPTERA) PRODUCTION IN A SECOND ORDER OKLAHOMA OZARK STREAM.
North Texas State Univ., Denton. Dept. of Biological Sciences.
K. M. Jop, and K. W. Stewart.
Journal of the North American Benthological Society JNASEC, Vol. 6, No. 1, p 26-34, March 1987. 1 fig, 6 tab, 32 ref. National Science Foundation Grants DEB 78-12565 and BSR 8308422.

Descriptors: *Aquatic insects, *Oklahoma, *Secondary productivity, *Stoneflies, *Stream biota, *Stream ecology, Aquatic habitats, Aquatic populations, Biomass, Energy, Organic matter, Particulate matter, Predation.

Knowledge of aquatic insect secondary production is of considerable ecological importance from both population (individual growth and population survivorship) and community (energy flow) perspectives. Total annual production by the stonefly assemblage (13 species in riffles) of a second-order Ozark foothills stream was 6.1/g dry weight or 25.5/g wet weight/sq m. The contribution of individual species to total stonefly production (dry weight) ranged from 0.01/g/sq m for Allocapnia rickeri to 2.57/g/sq m for Acroneuria evoluta. Over 50% of the stonefly production was contributed by the perlid predators Acroneuria evoluta and Agnetina capitata. Predators contributed 83% of the total stonefly biomass and 67% of the total production, even though they represented only 22% of the total abundance. Omnivores and shredders, which formed 78% of total stonefly density, contributed only 17% to the total biomass and 33% to total production. Stoneflies from samples

containing 6 g or more combined fine particulate organic matter and coarse particulate organic matter accounted for 67.2% of the total production. The high stonefly production of this Ozark foothills stream apparently contributes substantially to its total energy budget. (Author's abstract)

STUDIES ON THE PHYSICO-CHEMICAL PROPERTIES OF WATER THEIR VARIATION IN THE ERHAI LAKE (IN CHINESE).
Research institute of Environmental Protection, Yunnan, China.
B. H. Du.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 20, No. 6, p 538-543, November 1989. 5 fig, 2 tab, 3 ref. English summary.

Descriptors: *China, *Er Hai (lake), *Lakes, *Limnology, *Water chemistry, Air temperature, Biological oxygen demand, Chemical oxygen demand, Chemical properties, Dissolved oxygen, Nitrogen, Phosphorus, Seasonal variation, Transparency, Water temperature, Yunnan Plateau, pH.

Lake Erhai is situated at the west end of the Yunnan plateau. Its catchment area is 2565 sq km and the area of the lake is 250 sq km with a mean depth of 10.5 m and a maximum depth of 20.5 m. The pH, DO, BOD5, COD, total nitrogen and total phosphorus along with their changes in two-month intervals from April 1985 to April 1986 were measured. In addition, the atmospheric temperature , the water temperature, precipitation, transparency and water level of the lake were also recorded. The variation of these physico-chemical properties was related to seasonal changes in the climate. In June and August, pH, BOD5, COD, and total-N are very high, while transparency and DO levels were low. These values are reversed in February, which is the month with the lowest precipitation and the lowest lake level. The average lake water values for this period are: water temperature, 16.9C; transparency, 3.4 m; pH, 8.54; DO, 7.33 mg/l; BOD5, 2.33 mg/l; COD, 2.54 mg/l; total N, 0.605 mg/l; and total P, 0.031 mg/l. LAKESHORE SWAMPS OF BOSITENG LAKE IN THE XINJIANG AUTONOMOUS REGION (IN CHINESE).
Changchun Inst. of Geography (China).
X. H. Ma.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 20, No. 6, p 554-563, November 1989. 5 fig, 7 tab, 5 ref. English summary.

Descriptors: *Baseline studies, *Bositang Lake, *China, *Flora, *Limnology, *Marsh plants, *Swamps, *Wetlands, Arid climates, Eutrophication, Kaidu River, Peat, Reeds, Surveys, Typha, Xinjiang, Yangqi Basin.

The lakeshore swamps of Bositeng Lake in Xinjiang cover about 400 sq km and make up the largest areal swamp land in the arid zone of china. The climate of this region is temperate and arid. The Kaidu River with an origin in Tianshan Mountain and other creeks discharge a total of 4.16 billion cu m of water annually into the Yangqi basin. This stable water supply is the leading factor in swamp formation. The Yanqi basin is a good place for swamp formation and peat accumulation. The swamp is composed mainly of Typha and other reeds and herbaceous plants with an annual reed production that reaches 22.95 million tons. This provides an abundant raw material resource for the papermaking industry. Peat reserves in the swamps are nearly a hundred million tons, however peat in this area is unsuitable for large scale exploitation. Bositeng Lake and the lakeshore swamps are a special ecosystem under desert climate conditions, which plays an important role in maintaining the regional ecological balance. (Author's abstract)

SODA LAKES ON INNER MONGOLIA PLATEAU, CHINA.
Qinghai Inst. of Salt Lake, Xining (China).
D. P. Sun.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 21, No. 1, p 44-54, January 1990. 4 fig, 6 tab, 6 ref. English summary.

Descriptors: *China, *Geochemistry, *Mongolia, *Saline lakes, *Salinity, *Water chemistry, Arid climates, Badanjiling Basin, Clays, Climates, Eerdusi Basin, Erlian Basin, Geohydrology, Hailer Basin, Hydrogen ion concentration, Minerals, Trona.

The inner Mongolian plateau is one of the most important areas of salt lakes in China with trona deposits known throughout the world. The soda lakes spread mainly over the northern region of the Eerdusi basin, the central Erlian basin, the southeastern Hailer basin and Badanjiling desert. Generally, they cover an area from several to several dozen sq km, and are surrounded by sand dunes. The salinity of soda lake brines is 200-350 g/L, with pH values of 9.09-10.67. The brines mainly consist of Na(+), K(+), Cl(-), SO4(--), CO3(--) and HCO3(-) ions and therefore, belong to the Na-CO2-SO3-Cl type of brine. These are usually two layers of trona deposits in the soda lakes on the plateau composed mainly of natron, mirabilite, halite, and trona, as well as interbeds of black mud which contains a lot of illite clay, and much less gaylussite, dolomite and calcite. The trona layers always occur in a type of 'bull's eye pattern' in various lakes. Commonly, the soda lakes on the plateau were formed on the basin of deflation depressions from the beginning of the early Holocene. However, those trona deposits were precipitated mostly during the low temperatures of the mid-late Holocene. This was proved by laboratory freezing experiments and sporo-pollen analysis. (Author's abstract)

WATER BODY EVAPORATION EXPERIMENT OF POYANG LAKE (IN CHINESE).
Hydrometerological Experiment Station of Poyang Lake, Xingzi (China).
Z. X. Yin, and Q. Min.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 21, No. 1, p 70-79, January 1990. 6 fig, 6 tab, 6 ref. English summary.

Descriptors: *China, *Lake evaporation, *Lakes, *Poyang Hu (lake), Climates, Precipitation, Seasonal variation.

Poyang Lake is the largest fresh water lake in China. A study was conducted to determine the empirical formula and converting coefficients of the evaporation capacity of the surface of the lake, and the spatial change features of evaporation for the water surface as well as the characteristics of the evaporation discharge. The multiannual average evaporation capacity of Poyang Lake is 1163.3 mm. It increases gradually from February to July and decreases from September to December. The annual change is single peaked which is consistent with hydrological and meteorological factors. The annual evaporation capacity changes slightly. A trend was observed indicating that the change of evaporation capacity in the 1980's was smaller than that in the 1970's, which was smaller than in the 1960's. The distribution of annual evaporation from the surface is in line with the change in wind velocity. The annual evaporation capacity and the change of wind velocity from the surface are greater in the middle of the lake and less near the lake shore. The multiannual average evaporation discharge from the lake is 2.704 billion cubic m, which constitutes 21.5% of the water generation capacity, 11.0% of the lake capacity and 1.8% of the inward flow from the valleys. The evaporation capacity is greater than the water generation capacity from August to October. The supply flowing from the valleys is the key problem which should be taken into account in projects concerned with the control of Poyang Lake. (Author's abstract)

ANALYSIS OF AIR TEMPERATURE EFFECT OF TAIHU LAKE (IN CHINESE).
Academia Sinica, Nanjing (China). Inst. of Geography.
H. B. Lu, and G. L. Wei.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 21, No. 1, p 80-87, January 1990. 9 fig, 5 tab, 8 ref. English summary.

Descriptors: *Air temperature, *China, *Lakes, *Limnology, *Tai Hu (lake), ChangJiang Plain, Climates, Meteorology, Surface area, Temperature effects.

Taihu Lake is a large shallow fresh water lake in the lower Changjiang Plain, China, with an area of 2,428 square km and an average depth of 1.9 m. Its air temperature effects were analyzed with the data obtained from 14 meteorological stations including six stations specially set up in the Taihu Lake area. The profile of maximum air temperature approximated a hyperbola and that of minimum air temperature a parabola in the Taihu lake area. The mean air temperature effect of Taihu Lake was calculated using the data obtained in 1983-1984. The results show that the annual mean air temperature effect was 0.81C for the lake surface, 0.56C for the islands, and 0.34C for the lake shores. The strongest effect appeared in November, reaching 1.79C, 1.39C and 0.92C, while the weakest effect occurred in June, 0.29C, 0.09C, and 0.06C. The annual mean maximum air temperature on the shores was 0.3-1.0C lower than that on the surrounding meteorological stations far from the lake. The extreme minimum air temperature on the lake surface was 3.0-5.0C higher than that on the meteorological station which is located NW far from the lake. The impact of prevailing winds on the Taihu Lake air temperature effect were estimated, and the diagrams and empirical formulae for the minimum air temperature in water and the mean minimum air temperature in January on the lake surface are presented. The air temperature effects of Taihu Lake can reduce low temperature disasters for the double rice harvest in the lake region. (Author's abstract)

RECORD-BREAKING RISE OF GREAT SALT LAKE IN 1981-1986 RELATED TO ANOMALOUS MID-TROPASPHERIC WIND PATTERNS.
Scripps Institution of Oceanography, La Jolla, CA.
J. Namias.
Wetter und Leben WTLBAR, Vol. 41, No. 1/4, p 85-94, 1989. 8 fig, 6 ref. NSF Grant ATM-8407891, US Nat. Pro. Office Grant NA81AA-D-00054, USGS, Dept. of Interior Award No. 14-08-0001-G1483.

Descriptors: *Climatology, *Great Salt Lake, *Precipitation, *Water level, *Weather patterns, Lake level, North America, Seasonal variation, Wind patterns.

The Great Salt Lake has experienced many periods of excessive rainfall leading to high lake levels. The latest and highest of these occurred during the years 1981-1986 when the lake reached an historical level of 1283.77 m. The normal level computed

LIBRARY U. OF I. URBANA-CHAMPAIGN

for a period of 140 years from 1847 on was 1280 m. Increased precipitation, 134% higher than normal, was the principal cause for the rise in lake level. While there was above normal precipitation over much of the year, the fall season (September, October, November) exhibited the greatest increase in precipitation. It was shown that upper level prevailing contour and wind patterns in the midtroposphere were responsible for these conditions. Anomalous wind systems dominated a large portion of the northern hemisphere indicating that the conditions at Salt Lake were not unique. This analysis suggests that the Salt Lake's levels and precipitation patterns are good indices of total U.S. precipitation. The physical reasons for this lay in the peculiar course of cyclones and their induced veritical motions, and in the siphoning of rich moisture supplies from the eastern North Pacific and the Gulf of Mexico. GROWTH OF BACTERIA ON ORGANIC MATTER PRODUCED BY ALGAE IN CONTINUOUS CULTURES.
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
V. Vyhnalek, and K. Simek.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 37-42, 1990. 2 fig, 16 ref.

Descriptors: *Algae, *Bacteria, *Culturing techniques, *Extracellular metabolism, *Limnology, *Organic matter, *Plankton, Analytical techniques, Bacterial physiology, Biomass, Phytoplankton, Primary productivity.

Quantification of the fluxes of organic material from phytoplankton to bacterioplankton is difficult in natural waters. Biomass of algal cells and accompanying bacteria was quantified in non-axenic steady-state cultures of the green alga Chlamydomonas geitleri. Bacterial biomass produced in cultures was used to estimate a release of organic matter from algal cells. The inflowing medium was inorganic, no herbivorous zooplankton was present and no mortality of the Chlamydomonas cells was found during steady-state conditions. Therefore organic exudates of living algae were assumed to be the sole source of carbon for bacterial growth. In steady-states where C. geitleri grew under phosphorus limitation, the estimated exudate production (EP) did not exceed 6% of the net primary production. In contrast, in steady-states with light limitation of algal growth, EP ranged from 11.5 to 68.5% of the net primary production of C. geitleri. Continuous cultures of algae can therefore be used to provide information about the release of organic matter from algal cells and its utilization by bacteria. (Author's abstract)

EFFECT OF EXTRACELLULAR ORGANIC CARBON (EOC) FROM PHYTOPLANKTON ON THE COMMUNITY STRUCTURE OF OLIGOTROPHIC BACTERIA.
Kyoto Univ. (Japan). Faculty of Agriculture.
K. Fukami, S. Ohara, and Y. Ishida.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 43-47, 1990. 2 fig, 1 tab, 5 ref.

Descriptors: *Aquatic bacteria, *Extracellular metabolism, *Lakes, *Limnology, *Oligotrophy, *Organic carbon, *Phytoplankton, *Species composition, Bacterial analysis, Bacterial physiology, Culture media, Culturing techniques, Japan, Lake Biwa, Oligotrophic bacteria, Seasonal variation.

The effect of phytoplankton, through their extracellular organic carbon (EOC), on the community structure of oligotrophic bacteria was studied. This was done by comparing the most-probable number (MPN) of oligotrophic bacteria, using filtered lakewater samples containing different dominant species of phytoplankton as MPN media. Water samples to be used for the counting of bacterial numbers were collected once a month at a depth of 6 m in the northern part of Lake Biwa, Japan. A part of each sample was sterilized by passage through a Millipore filter with a 0.22-micron pore size. When they were not used immediately, filtered water samples were kept frozen at -20 C until employed for experiments. Artificial peptone medium of low concentration was used as a reference medium. Bacterial MPNs from inocula cultured in water collected at the same time as the inoculum were compared with MPNs for inocula cultured in water collected in other months and for inocula cultured in the reference medium. In most cases, MPNs with simultaneously-collected lake water medium were remarkably higher than those with the other two media. However, MPN values were comparable when MPN media were prepared with lake water of different seasons which contained the same dominant species of phytoplankton as media prepared with simultaneously-collected lake water. Moreover, it was shown that media prepared with the filtrate of an axenic culture of Staurastrum dorsidentiferum gave much higher MPN values for bacterial communities that were present during seasons when this phytoplankton species predominated than did even simultaneously-collected lake water media. These results indicate that dominant species of phytoplankton affect, through their extracellular organic carbon, the community structure of oligotrophic bacteria in natural waters. (MacKeen-PTT)

CARBON FLUX FROM PHYTOPLANKTON TO FREE-LIVING BACTERIAL DNA.
Shinshu Univ., Matsumoto (Japan). School of Allied Medical Sciences.
K. Kato.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 49-52, 1990. 2 tab, 14 ref. The Ministry of Education, Science and Culture, Japan, Grants 60129034, 61134044 and 62124040.

Descriptors: *Aquatic bacteria, *DNA, *Dissolved organic carbon, *Eutrophic lakes, *Limnology, *Nutrients, *Phytoplankton, Bacterial DNA, Bacterial analysis, Bacterial physiology, Carbon cycle, Japan, Lake Suwa, Radioactive tracers.

Extracellularly released dissolved organic carbon (EDOC) from photosynthesizing phytoplankton is considered to be an effective source for the growth of bacteria in the euphotic zone of pelagic ecosystems. Measurement of planktonic bacterial DNA synthesis from algal excretion was carried out in a eutrophic lake, Lake Suwa, in spring 1986 using C-14 labeled bicarbonate tracer. The algal biomass ranged from several microg to 30 microg chl a/L. Up to 10% of added C-14 bicarbonate was fixed by planktonic organisms in 4 h, 1.8 to 8.4% of which was found in the free-living bacterial fraction. Direct fixation of C-14 bicarbonate by free-living bacteria amounted to only 13 +/-5% of the total cellular C-14 fixed into this fraction. Thus, more than 80% of C-14 fixed by free-living bacteria originated from phytoplankton via the dissolved organic phase, EDOC. The transformation constant of C-14 from phytoplankton to free-living bacterial DNA in the study was estimated at 1%. (MacKeen-PTT)

ALGAL EXUDATION AND ITS RELATION TO BACTERIAL PRODUCTION DURING VERNAL PHYTOPLANKTON BLOOMS.
Tvarminne Zoological Station (Finland).
R. Lignell.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 53-59, 1990. 1 fig, 1 tab, 22 ref.

Descriptors: *Algae, *Algal blooms, *Aquatic bacteria, *Bacterial productivity, *Dissolved solids, *Extracellular metabolism, *Phytoplankton, Bacterial physiology, Baltic Sea, Carbon cycle, Dissolved organic carbon, Marine bacteria, Organic compounds, Primary productivity, Radioactive tracers.

In pelagic waters, algal release of dissolved organic photosynthates is a major autochthonous pathway of substrates for bacteria. Phytoplankton primary production and release of extracellular organic compounds (exudation) were compared with measurements of bacterial production during spring bloom periods in the Baltic Sea. Net exudation (dissolved exudate pool) varied between 1 and 7% of the primary productivity. Nutrient enrichment caused a significant decrease in the percentage net exudation (PER) values. On the other hand, the net PER values decreased significantly during the decline of the bloom, probably due to a change of the dominant algal species. During the peak of the spring bloom in 1988, the total algal biomass, primary productivity and net exudation amounted to 1.8 g C/sq m, 1 g C/sq m/d and 30 mg C/sq m/d, respectively. Bacterial productivity, determined by means of (H-3)-thymidine incorporation, was about 40 mg C/sq m/d in the euphotic zone, and bacteria obtained about 20% of their carbon via (C-14)-exudate uptake. Descriptors: *Aquatic bacteria, *Dissolved organic carbon, *Eutrophic lakes, *Limnology, *Phytoplankton, Algae, Bacterial physiology, Carbon cycle, Dissolved solids, Lake Mikolajskie, Mazurian Lake District, Photosynthesis, Poland, Primary production, Radioactive tracers, Respiration.

Production and utilization of photosynthetic organic matter were studied in the pelagic zone of the highly eutrophic Lake Mikolajskie, Mazurian Lake District, Poland. About 97% of the total fixed (C-14)-carbon dioxide (TFC) was incorporated photosynthetically by algal cells, and 3% was fixed by microplankton in darkness. In the course of photosynthesis about 20% of TFC was released into the water, about 10% was respired, and about 70% remained in the microplankton particulate fraction (POC). The chemical composition of POC produced was strongly dependent on light conditions during photosynthesis. Radiocarbon was mainly incorporated into water soluble low molecular weight compounds (LMWC) and polysaccharide fractions. An increased contribution of proteins and lipids to POC was found when algal photosynthesis was light limited. Released organic carbon and the LMWC fraction of POC were preferentially utilized by aquatic bacteria. Supplementation of water samples with LMWC stimulated the bacterial growth rates and production. The development and structure of aquatic heterotrophic bacterial populations is to a great extent determined by the availability of carbon sources. Environmental changes in the supply and substrate diversity of dissolved organic matter may occur within seconds or minutes and therefore, survival may depend on biochemical adaptations which must occur at the same fast rates. Some ecological aspects of enzyme regulation in aquatic bacteria were reviewed. The two basic types of enzyme regulation are quantitative and qualitative regulation. The tricarboxylic acid (TCA) cycle is one of the most important regulatory networks of the cell for catabolic and anabolic pathways. Phosphoenolpyruvate (PEP) carboxylase is not only involved in modifications of photosynthetic pathways, but can be considered one of the most important carboxylating enzymes in plants and microorganisms with manifold functions. Without PEP as the carbon dioxide acceptor and with pyruvate, carbon dioxide fixation is negligible, suggesting the involvement of PEP carboxylase in the reaction. PEP carboxylase, a tetramer, is allosterically regulated in a cooperative manner. A model of PEP carboxylase regulation in the bacterial cell features PEP as a substrate used for production of oxaloacetate and pyruvate through different channels; allosteric regulation by PEP; acetyl-CoA as a strong activator of the enzyme, thus promoting TCA reactions; and feedback inhibition by aspartate and malate. Descriptors: *Algal blooms, *Aquatic bacteria, *Bacterial physiology, *Enzymes, *Eutrophic lakes, *Extracellular metabolism, *Glucose, *Limnology, Beta-glucosidase, Glucose metabolism, Heterotrophic bacteria, Phytoplankton, Secondary productivity, Substrates.

Activity of beta-glucosidase (beta-GlcA), the enzyme that hydrolyses beta-linked disaccharides of glucose and liberates free glucose, was studied in a eutrophic lake during the spring algal bloom. Beta-GlcA was produced by heterotrophic bacteria and its activity correlated positively with bacterial secondary production and glucose incorporation. The highest beta-GlcA was associated with the phytoplankton bloom breakdown. Beta-GlcA was under control of a repression/induction mechanism, and the synthesis became depressed when the level of easily assimilated substrates had fallen below a critically low level. The enzymatic liberation of glucose in close vicinity to the bacterium may create and sustain high glucose concentrations near the cell surface. The active transport system of the cell membrane can be exposed to an increased concentration gradient of glucose, which facilitates its rapid uptake. (Author's abstract)

Descriptors: *Aquatic bacteria, *Bacterial physiology, *Bacterial productivity, *Eutrophic lakes, *Limnology, *Nutrients, Amino acids, Fructose, Glucose, High performance liquid chromatography, Nutrient assimilation, Nutrient concentrations.

Bacterial assimilation of dissolved free glucose, fructose and amino acids was studied in two eutrophic lakes and in a laboratory experiment. The assimilation rates were related to the actual bacterial production. Natural concentrations of free glucose and fructose in the lakes were measured combining separation by high performance liquid chromatography with a post-column color reaction of the saccharides. Free amino acids were quantified as fluorescent derivatives. Concentrations of free glucose, fructose and amino acids in the lakes were 33-95 nM, 7-55 nM and 6-34 nM, respectively. In the three studies assimilation (respiration + incorporation) of the organic compounds on the average sustained 6.7, 11 and 61% of the bacterial carbon requirement. Glucose was the predominant compound assimilated, followed by either fructose or amino acids. A comparison of concentration changes and assimilation rates demonstrated that a large production of both monosaccharides and amino acids occurred during the experiments. Generally the bacterial production varied independently of concentrations and assimilation rates of the tested organic compounds. (Author's abstract)

APPLICATION OF THE ISOTOPE DILUTION PRINCIPLE TO THE DETERMINATION OF SUBSTRATE INCORPORATION BY AQUATIC BACTERIA.
Warsaw Univ. (Poland). Dept. of Environmental Microbiology.
R. J. Chrost.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 111-117, 1990. 3 fig, 2 tab, 13 ref. Project CPBP 04.02.3.1. (Poland).

Descriptors: *Aquatic bacteria, *Bacterial physiology, *Chemical analysis, *Eutrophic lakes, *Limnology, *Nutrients, Amino acids, Analytical methods, Glucose, Isotope studies, Isotopic tracers, Leucine, Nutrient assimilation, Nutrient concentrations, Phytoplankton.

Isotope dilution analysis was used for the estimation of incorporation of (C-14)-glucose, (H-3)-leucine and (C-14)-protein hydrolysate by bacterioplankton in eutrophic lakes. Unlabeled glucose, leucine, or leucine-containing peptides in lake water significantly lowered apparent incorporation of (C-14)-glucose and (H-3)-leucine, respectively. Similar results were obtained in experiments in which the effect of casein hydrolysate and peptides on (C-14)-protein hydrolysate uptake by aquatic bacteria were studied. The apparent incorporation of labeled substrates was lower because radiolabels were isotopically diluted (thus had lower specific activity) by unlabeled glucose, leucine or amino acids resulting from extracellular and/or intracellular hydrolysis of the naturally present macromolecules containing these compounds. In the photic zone of eutrophic lakes, natural pools of glucose and leucine varied strongly from 115 to 726 nM, and from 12 to 135 nM, respectively. The largest pools of glucose and leucine were observed during the phytoplankton mass development. (Author's abstract)

CLAY, DISSOLVED ORGANIC MATTER, AND BACTERIAL INTERACTIONS IN TWO RESERVOIRS.
Baylor Univ., Waco, TX.
O. T. Lind, and L. O. Davalos.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 119-125, 1990. 1 fig, 1 tab, 31 ref.

Descriptors: *Aquatic bacteria, *Bacterial productivity, *Clays, *Dissolved solids, *Limnology, *Reservoirs, Bacterial physiology, Organic matter, Phytoplankton, Regression analysis, Temperature, Texas, Turbidity.

The concentration of suspended clays as well as the concentration of dissolved organic matter (DOM) was shown to be an important variable in determining the rate of specific bacterial production (thymidine incorporation). Evidence for this conclusion comes from two subtropical Texas reservoirs. Sampling stations were selected to provide a range of inorganic turbidities, organic content, and trophic state. Stepwise multiple regression analysis was used to determine the percent variation in specific bacteria production that could be explained by a suite of environmental variables (turbidity, temperature, total and dissolved organic matter, and phytoplankton mass). For the composite data set (33 cases), phytoplankton mass (as chlorophyll a) explained 36% of the variation in bacterial production with DOC explaining an additional 3%. However, when data from the most turbid station were evaluated, 77% of the variation in bacterial production was explained by the turbidity with an additional 14% explained by the concentration of DOM. At the most turbid station, the number of clay-attached bacteria as a percent of total bacteria was directly related to the content of particulate organic carbon but not to DOC. The relationship of clay and DOM to bacterial production often may have been overlooked due to the low inorganic turbidities present in most of the marine and freshwater ecosystems investigated previously. This concept is important to the understanding of the trophic ecology of reservoirs, and other turbid ecosystems, where light limitation of phytoplankton occurs. (Author's abstract)

Descriptors: *Decomposition, *Lakes, *Limnology, *Litter, *Mineralization, *Organic carbon, Carbon cycle, Germany, Lake Stechlin, Macrophytes, Microorganisms, Oligotrophic lakes, Organic matter.

The input of large airborne coarse particulate matter into the oligotrophic Lake Stechlin (East Germany) was investigated. In autumn 1985 this input reached 18.0 t of organic carbon and increased to about 125.0 t if decomposition of macrophytes was taken into account. The decomposition rate of beech litter (Fagus sylvatica) was about five-fold lower than the rate of the macrophyte Potamogeton lucens. The incubation of beech litter in other lakes (acidotrophic, eutrophic) or in Lake Stechlin during summer did not result in any change in decomposition rate. Dynamics of different parameters (bacterial numbers, uptake rate of glucose and acetate, dissolved organic carbon, ortho-phosphate and others) during the decomposition of beech litter and macrophytes showed a leaching loss of material up to 10% in the first hours, an increase of microbial activity in the first 10 days followed by a decrease up to day 35, and a relatively constant period. gy, Decomposition, Limnology, Metabolism, Nitrogen, Organic matter, Sediments, Trophisms.

Research on the decomposition of raw cellulosic materials was carried out in a rice field during the submersion period. The experimental approach consisted of adding powdered wheat straw as recalcitrant matter to the surface sediment inside the enclosures. The decomposition rates and the amount of residual carbon seem to depend upon the initial C/N ratio. The higher the carbon concentration added, the higher the microbial respiratory metabolism and adenosine triphosphate, and the lower the pH and Eh values, both in water and sediments. The results indicated that nitrogen was an important factor in controlling straw decomposition, and that high inputs of organic matter may, at least initially, considerably modify the trophic status of the environment as a whole. Descriptors: *Aquatic bacteria, *Nutrients, *Periphyton, *Stream ecology, *Streams, Bacterial physiology, Bioindicators, Ecosystems, Heterotrophic bacteria, Nutrient concentrations.

Microbial attachment to submerged surfaces and the development of attached communities (periphyton) are of great importance for running water ecosystems. The response of attached microbial communities to changes of nutrient concentration in water was studied under natural stream conditions. The heterotrophic bacteria counts increased by 1-2 orders of magnitude in the periphyton within 24-48 h of peptone dosing (1-2 mg/L final concentration) and reached 1,400,000/sq cm and 1,050,000/sq cm in the experimental periphyton and in the epilithon, respectively. Thus, the average bacterial periphyton growth rate was estimated at 0.05/h during the first five days of peptone dosing. Significantly higher counts of heterotrophic bacteria were found 72-96 h after stopping treatment. After 25 days of phosphate dosing (0.1-0.5 mg/L phosphate-P), chlorophyll a in experimental periphyton reached approximately twice the control level, while heterotrophic bacteria counts were not substantially increased. The attached microbial communities proved to be both a sensitive and stable indicator of substrate and nutrient concentrations in running waters. (MacKeen-PTT)

EFFECT OF PERIODIC ILLUMINATION ON NITRIFICATION IN THE CONTINUOUS CULTIVATION.
South Bohemian Biological Centre, Ceske Budejovice (Czechoslovakia).
J. Vrba.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 145-150, 1990. 2 fig, 1 tab, 14 ref.

Descriptors: *Aquatic bacteria, *Light effects, *Limnology, *Nitrification, *Photoinhibition, Ammonia, Bacterial physiology, Culturing techniques, Kinetics, Nitrates, Substrates.

Light is a major factor influencing biological nitrification in natural waters. The effect of photoinhibition was studied in the laboratory in long-term continuous cultures of nitrifying bacteria from river water. The continuous culture was stabilized in the dark at 27 C. In all cultures, a successive development of ammonia and nitrate oxidation was observed. Ammonia was fully oxidized to nitrate by the 26th day, and the chemostat was changed to 12 h light/12 h dark cycles at the 27th day. An obvious increase of substrate concentration occurred during the next 8 days. Ammonia concentration decreased during dark periods and increased during light periods. When the light was discontinued, nitrification rates fully recovered in a few days. The course of photoinhibition of both nitrate and ammonia oxidation appeared to follow first-order reaction kinetics. Photoinhibition of autotrophic nitrification should be considered in field studies, especially in shallow transparent water. (MacKeen-PTT)

IMPROVED ASSESSMENT OF BACTERIAL PRODUCTION: COMBINED MEASUREMENTS OF PROTEIN SYNTHESIS VIA LEUCINE AND CELL MULTIPLICATION VIA THYMIDINE INCORPORATION.
Konstanz Univ. (Germany, F.R.). Limnological Inst.
M. Simon.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 151-155, 1990. 23 ref.

Descriptors: *Analytical methods, *Aquatic bacteria, *Bacterial analysis, *Bacterial productivity, *Limnology, *Proteins, Bacterial physiology, Bacterial protein production, Biomass, Growth rates, Isotopic tracers, Leucine incorporation, Thymidine incorporation.

The recent introduction of the bacterial protein production (BPP) method using (H-3)-leucine incorporation has been shown to be a valuable complement to bacterial production measurements by the (H-3)-thymidine incorporation (TdR) method. It measures directly bacterial biomass production and provides an independent examination of the magnitude of TdR measurements, which are still somewhat controversial due to the variability of TdR-conversion factors not being completely understood. Variation in (H-3)-TdR intracellular isotope dilution which cannot be determined directly presumably affects this factor greatly. Since the BPP method allows measurement of (H-3)-leucine intracellular isotope dilution, leucine-BPP conversion factors can be determined directly. Thus, using both (C-14)-leucine and (H-3)-TdR in a double labeling technique, BPP and cell multiplication rates can be measured simultaneously in the same sample. Besides the direct determination of a BPP conversion factor, this allows indirect calculation of a conversion factor for TdR. It further allows calculation of the amount of protein per newly synthesized cell. This ratio, which is responsive to changing growth conditions of bacteria, may provide a more detailed insight into the growth dynamics of aquatic bacterial assemblages. (Author's abstract)

BACTERIAL NET PRODUCTION APPROACHING ZERO--A FREQUENT PHENOMENON IN PELAGIC ENVIRONMENTS.
Staatliches Inst. fuer Seenforschung und Fischereiwesen, Langenargen (Germany, F.R.).
H. Gude.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 165-169, 1990. 26 ref.

Descriptors: *Aquatic bacteria, *Bacterial physiology, *Bacterial productivity, *Growth rates, *Limnology, *Plankton, Analytical methods, Bacterial analysis, DNA, Lake Constance, Nucleic acids, Secondary productivity.

It has been suggested that bacterial populations represent a very productive part of planktonic communities. However, three independent estimates for Lake Constance show mean doubling times of epilimnic bacteria in excess of 10 d during the warm season. Low productivity was also indicated by very low bacterioplankton RNA/DNA ratios. High bacterial production also cannot be reconciled with the low bacterial growth efficiencies observed under natural conditions. This apparent disagreement with the current view may be mainly due to two reasons: (1) Because of morphological and physiological changes observed frequently during incubation, the suitability of dilution experiments for estimates of in-situ growth can be questioned. (2) As shown by starvation experiments, biosynthesis is not identical with growth. A thorough reconsideration of current in situ growth estimates is recommended. (Author's abstract)

Microbiological investigations were performed in Lake Fuchskuhle, a small acid forest lake (1.5 ha, 5.5 m maximum depth, 4.2-4.6 pH) in the Lake Stechlin area, East Germany. In view of a relatively constant number of bacteria (1,300,000/ml, acridine-orange direct count), an unexpectedly high amplitude of uptake rates (0.003-1.67 microg C/L/h, (C-14)-glucose) was observed in the water column. The uptake rates seemed to be closely correlated with phytoplankton primary production. Experiments with artificially-altered water resulted in a decrease in uptake rates with increasing pH values. The water-sediment interface showed oxic conditions. Carbon mineralization rates in the upper 5 cm of sediment were 10-100 times greater than those measured in the overlying water. Methylotrophic bacteria concentrations of up to 29,000,000/L were measured at the sediment surface. The bacterial carbon dioxide production was assumed to be an essential element of carbon metabolism in this extreme environment. (Author's abstract)

BACTERIAL PRODUCTIVITY IN SEDIMENTS.
Commonwealth Scientific and Industrial Research Organization, Cleveland (Australia). Marine Labs.
D. J. W. Moriarty.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 183-189, 1990. 1 fig, 24 ref.

Descriptors: *Analytical methods, *Bacterial physiology, *Bacterial productivity, *Heterotrophic bacteria, *Limnology, *Sediments, DNA, Growth rates, Isotopic tracers, Sediment analysis, Thymidine uptake.

The growth of heterotrophic bacteria can be determined with reasonable accuracy with the thymidine method, provided certain conditions are adhered to during the experiment. As this is a pulse label method, the incubation time must be kept short to ensure that DNA is the only macromolecule labeled and that its rate of synthesis is not changed by disturbance of the sediment. The concentration of added thymidine must be high enough to prevent isotope dilution: in water about 20 nM and in sediment about 20 microM. Although more accurate factors for converting rates of DNA synthesis to numbers of dividing bacteria need to be determined by further research, the factors seem to lie within the theoretical range (0.25 to 0.8 quintillion). Higher factors would indicate either a deficiency in the methods for measuring rates of thymidine incorporation into DNA or the presence of a rapidly growing population of bacteria that cannot take up thymidine. Values for bacterial productivity in sediments, determined by the thymidine method, agree well with estimates from other methods and also with the amount of carbon supplied by primary producers. (Author's abstract)

Descriptors: *Bacterioplankton, *Chlorophyll, *Czechoslovakia, *Fish ponds, *Lakes, *Limnology, *Reservoirs, Aquatic bacteria, Bacterial physiology, Biomass, Glucose uptake, Phytoplankton, Regression analysis, Stagnant water, Substrates, Trophic level.

Numbers, biomass, activity and production of bacterioplankton generally increase with the trophic state of water ecosystems in most of which phytoplankton is the primary source of substrates for bacterioplankton. Direct counts of bacteria (DC), maximal velocity of (C-14)-glucose uptake per liter (V(max)) and per unit of DC (V(max spec)) were related to chlorophyll a concentration (CHL) in 104 samples representing all types of stagnant waters in Czechoslovakia: alpine and subalpine lakes, various types of reservoirs and productive fishponds. Total range of CHL was 0.03-1098 microg/L. Linear regression equations were obtained showing good correlation of DC and V(max) to phytoplankton biomass; V(max spec), calculated per unit of bacterial count, was relatively independent of CHL. Results showed that activity in bacterioplankton is regulated at the cellular level and supply of substrates to an individual or 'mean' cell is a more important factor than the general trophic state of a water body. Descriptors: *Agricultural runoff, *Aquatic bacteria, *Bacterial physiology, *Bacterial productivity, *Bacterioplankton, *Lakes, *Limnology, *Nutrients, *Respiration, Agriculture, Biomass, Glucose uptake, Latgalian elevation, Latvia, Phosphorus, Trophic level, USSR.

Limnological surveys were conducted from 1977 to 1984 in 14 lakes of the Latgalian elevation in eastern Latvia. The principal aim of the investigation was to assess changes in lake productivity due to intensified agricultural transformations of the watersheds. Increased phosphorus loading was found to provoke a rise in lake bioproductivity. This resulted in the augmentation of the total number (N) and biomass (B) of bacterioplankton. The annual bacterial production (P) was well correlated with phosphorus loading at the lake. At the same time a direct dependence of the annual bacterial production on primary phytoplankton was not found. The intensity of bacterial respiration (R) increased with increasing trophy level, to a certain limit. In highly productive lakes the intensity of bacterial respiration was rather low. The specific activity of bacterioplankton (P/B, R/B) decreased with increasing trophic level. In highly productive lakes the maximal uptake rate of glucose per individual bacterial cell also decreased. (Author's abstract)

In a mesotrophic reservoir, Rimov Reservoir in Czechoslovakia, the seasonal dynamics of bacteria in the surface layer were followed from April to October and related to phytoplankton biomass and production and to zooplankton biomass. Phytoplankton available for zooplankton grazing was distinguished according to the sizes of the cells and colonies (40 microm diameter). Bacterial production due to extracellular exudates from healthy phytoplankton cells was calculated from the early spring data and found to equal 1.4% of net primary production. Bacterial production from zooplankton excreta was correlated with both available phytoplankton and cladoceran biomasses. It corresponded to 10.5% of available phytoplankton biomass per day. Elimination of bacteria by protozoans was measured directly for the whole season and elimination by bacterivorous zooplankton (rotifers and cladocerans smaller than 710 microm) was calculated on the basis of several experiments. The clearance rates of zooplankton feeding on bacteria were 20% of those feeding on available phytoplankton. For the whole ten-month period, the epilimnetic bacterial production reached 2.08 g C/cu m, which equaled 7% of gross primary production; 12% of bacterial production originated from algal extracellular release, the rest was from zooplankton excreta. Of the total elimination, 8% was due to protozoans and 92% due to zooplankton. (Author's abstract)

NOTE ON THE MEASUREMENT OF PRODUCTION OF PHOTOTROPHIC BACTERIA IN DEEP LAYERS.
Limnologisch Inst., Nieuwersluis (Netherlands). Vijverhof Lab.
C. L. M. Steenbergen, and P. van den Hoven.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 249-255, 1990. 2 fig, 1 tab, 19 ref.

Descriptors: *Analytical methods, *Aquatic bacteria, *Bacterial physiology, *Bacterial productivity, *Lakes, *Limnology, Anaerobic conditions, Biological samples, Biomass, Chlorophyll, Deep water, Lake stratification, Light intensity, Limiting factors, Oxygen, Photosynthesis, Phototrophic bacteria, Sample preparation, Sulfides.

Production measurements of deep phototrophic bacterial assemblages, found at the oxygen-sulfide interface of productive stratified lakes, are often frustrated by the simultaneous occurrence of oxygenic and anoxygenic forms which pose problems of the collection of samples and their manipulation. Also, contact of deep water samples with air needs to be avoided. The two types of photosynthesis were measured in separate samples using 3-3,4-dichlorophenyl-1,1-dimethylurea (DCMU) as an inhibitor of the oxygenic photosynthesis in one sample series. For reliable biomass determinations in terms of chlorophyll a and bacteriochlorophylls, chromatographic techniques were employed to isolate the various compounds enabling calculation of their concentrations separately. Ideally production values should be expressed in relation to other parameters such as biomass and light intensity. In addition, sulfide limitation of the anoxygenic photosynthesis should be considered also. (Author's abstract)

The differential estimation of participation by some microzooplankton groups in food consumption was given for a seasonal cycle of observation for Dalnee Lake, Kamchatka, USSR. The succession in the planktonic community of the lake has a two-phase character and passes through autotrophic and heterotrophic phases. The utilization of primary production by microzooplankton was possible only during the spring development of algae. Then, in the heterotrophic phase, detritus was utilized for the dissipation of organic matter in the food chain. The animals' daily ration increased 2-10 times as much as the production of phytoplankton and the summer biomass of food resources was considerably higher than its consumption. During 5 months, the harvest of heterotrophic organisms comprised: bacteria, 50 g C/sq m; flagellates, 5 g C/sq m; ciliates, 10 g C/sq m; herbivorous rotifers, 2 g C/sq m; and nauplii of copepods, 3 g C/sq m. The efficiency of utilization of the potential food objects by the microzooplankton community was 7%, and by the whole filtering plankton, 17%. (Author's abstract)

The self-purification processes in aquatic environments proceed as the result of functioning of an intact ecosystem, which includes all the components of the food chain. During the study of these processes in the Yenisei River, from the Krasnoyarsk hydropower station to the port of Igarka, the roles of heterotrophic microplankton as a component of the river ecosystem were investigated. The river water below the gate of the Krasnoyarsk hydropower station was extremely poor in microplankton, possibly due to the destruction of plankton by the cavitation process in turbines. The decrease in zooplankton biomass inhibited the self-purification process. The nongrazed microbial biomass accumulated in the river water between Krasnoyarsk up to the Angara River mouth, was then actively grazed and decomposed in the middle part of the river below Yartzevo, where a mass development of microzooplankton (mainly ciliates) took place. Below the Angara River mouth, a mass bloom of diatoms occurred and the primary production soon reached its maximum (up to 400 mg C/cu m/d). In the lower part of the river a mature and rich planktonic community was formed, which provided decomposition of about 8 g/sq m/d of organic matter. The processes of self-purification in the plankton community of the Yenisei River proceeded mainly within the food chain: bacteria-zooflagellates-ciliates. (MacKeen-PTT)

The potential impact of ciliates and heterotrophic nanoflagellates (HNF) on bacterioplankton in the Rimov Reservoir was studied from April until October 1987 using inert fluorescent particles (FP). HNF (500-1280/ml) were the dominant micrograzers during the spring period and grazed 3 to

LIBRARY U. OF L. URBANA CHAMPAIGN

9% of bacterial standing stock daily. The average ingestion rate based on HNF with ingested FP (3.3-48% of the total) ranged from 7-28 bacteria/cell/h. During the spring, <25% of the total ciliates ingested FP, with average ingestion rates of 7-44 bacteria/cell/h. A drastic decrease in protozoan density occurred during the clearwater phase. Ciliates (15-142/ml) became the dominant micrograzers during summer with average ingestion rates ranging from 22-111 bacteria/cell/h (based on ciliates ingesting FP). During the period of peak ciliate abundance, the protozoan community grazed up to 21% of the bacterial standing stock daily. Egestion of FP by ciliates was insignificant. (Author's abstract)

SPHAGNUM-DOMINATED PEATLANDS OF THE HYPEROCEANIC BRITISH COLUMBIA COAST: PATTERNS IN SURFACE WATER CHEMISTRY AND VEGETATION.
Alberta Univ., Edmonton. Dept. of Botany.
D. H. Vitt, D. G. Horton, N. G. Slack, and N. Malmer.
Canadian Journal of Forest Research CJFRAR, Vol. 20, No. 6, p 696-711, June 1990. 8 fig, 3 tab, 61 ref. Natural Sciences and Engineering Research Council of Canada Grants A6390 and U0015.

Descriptors: *British Columbia, *Peat, *Peatlands, *Sphagnum, *Water chemistry, *Wetlands, Bogs, Canada, Classification, Coastal wetlands, Fens, Vegetation, Water level.

Vegetation from 133 releves representing a broad spectrum of peatland types from the Prince Rupert area, British Columbia were divided into six releve groups. The 210 taxa found in these releve groups were classified into six species groups. In general, the species groups are related to one another along shade and height (above water level) gradients. Chemical and physiographic gradients that correlate with the releve distribution pattern on a detrended correspondence analysis ordination are: surface water chemistry, shade and height. In particular, the major gradient influencing the first axis of the ordination is shade. The second axis of the ordination is related to a complex chemical gradient in which hydrogen ion, calcium, and sulfate are the most important components. These chemical changes are influenced by ombrotrophy. Surface water chemistry patterns show enriched ionic conditions on Graham Island (Queen Charlotte Islands), with a decrease inland. Especially important is the decrease of sodium and chloride ions. The peatland studied include ombrotrophic bogs and soligenous fens. Raised bogs were found in basins, while blanket bogs occurred on gentle slopes at the most oceanic site. Pinus contorta Loud. var. contorta is most abundant at ombrotrophic sites, while Chamaecyparis nootkatensis Spach is dominant in soligenous fens. Soligenous poor fens, characterized by high Sphagnum abundance in lawns and forest islands, and a pH of 4.4-6.6, is the peatland type most frequently encountered in the study area. The factors causing spatial and temporal patterning of interstitial water chemistry in Crystal Bog, a 7 ha northern Wisconsin kettle-hole peatland was studied. Over the course of the snow-free season Crystal Bog exhibited spatial and temporal patterns in chemistry, especially hydrogen-ion, dissolved organic carbon, and specific conductance. The peatland contains a 0.5 ha pond that has water more dilute than the interstitial water of the surrounding peatland. The direction of groundwater flow between the lake and the peatland was seasonally dependent. In the spring and early summer, flow was from the lake into the peatland, especially on the eastern side of the lake. This flow resulted in a plume of relatively dilute surface interstitial water in the peatland. In mid and late summer direction of groundwater flow was from the peatland into the lake and the dilute plume was reduced in areal extent. By fall the direction of water flow was again from the lake to the peatland. The spatial and temporal heterogeneity in water chemistry produced by the seasonal variation in the direction of horizontal water flow was substantial. Minimum and maximum observed concentrations of dissolved organic carbon (DOC) in the interstitial water of the peatland, for example, differed by more than a factor of three, and the pH ranged between 3.8 and 5.0. Correlations of DOC with anion deficit and hydrogen ion concentration and experiments of photo-oxidation of water samples showed that organic acids were the primary cause of acidity in the peatland. Specific conductance was highly correlated with DOC, probably because of DOC's correlation with the very conductive hydrogen ion. In Crystal Bog it was possible to use the relatively simple measure of specific conductance to estimate the temporal and spatial distribution of the more difficult to determine DOC. FATE OF ADDED N-15 LABELLED NITROGEN IN A SAGITTARIA LANCIFOLIA L. GULF COAST MARSH.
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
R. D. DeLaune, and C. W. Lindau.
Journal of Freshwater Ecology JFREDW, Vol. 5, No. 3, p 265-268, June 1990. 2 fig, 1 tab, 8 ref. NSF Grant BSR-8414006.

Descriptors: *Coastal marshes, *Emergent aquatic plants, *Gulf of Mexico, *Nitrogen cycle, *Wetlands, Arrowheads, Biomass, Detritus, Louisiana, Nitrogen compounds, Path of pollutants, Radioisotopes, Tracers.

Response of Sagittaria lancifolia L. to added N-15 labeled nitrogen was studied in a Louisiana Gulf Coast freshwater marsh. The amount of the added labeled NH4(+)-N remaining in the soil or plant tissue was determined several times during the growing season. Above-ground biomass increased by approximately 100 percent following the addition of 10 g NH4(+)-N per square meter. There was no significant nitrogen loss from the soil during the growing season after the labeled inorganic nitrogen was apparently immobilized into the soil organic nitrogen pool. The N-15 balance data obtained from this study demonstrates that following the initial loss prior to the first sampling there is little nitrogen loss from the soil. Nitrogen losses were likely from the plant, either through leaching or physical transport of detritus remaining as a result of die-back that resulted from the growth cycles occurring during the season. The nitrogen loss reported is greater than previous nitrogen studies conducted in other marsh types in coastal Louisiana. Plant biomass response of Sagittaria lancifolia to added nitrogen was greater than that reported for other Louisiana coastal wetland plant species. (Agostine-PTT)

EFFECT OF NUTRIENT CONTENT ON LEAF DECOMPOSITION IN A COASTAL PLAIN STREAM: A COMPARISON OF GREEN AND SENESCENT LEAVES.
Savannah River Ecology Lab., Aiken, SC.
L. G. Leff, and J. V. McArthur.
Journal of Freshwater Ecology JFREDW, Vol. 5, No. 3, p 269-277, June 1990. 4 fig, 1 tab, 26 ref. U.S. D.O.E. Grant DE-AC09-76SR00-819.

Descriptors: *Coastal plains, *Coastal streams, *Decomposing organic matter, *Leaves, *Nutrients, Bacteria, Biomass, Invertebrates, Maple trees, Riparian vegetation, Seasonal variation, Toxins.

Studies on leaf processing in temperate lotic environments have emphasized the importance of input of senescent leaves in the fall because of the large, obvious influx of riparian biomass at this time. Differences in processing have been found between species of leaves, and these differences have been attributed to thickness of the cuticle, presence of toxic or inhibitory compounds, and nutrient content. The decomposition of fresh-green and autumn-shed (senescent) red maple leaves (Acer rubrum) were compared in a low-gradient blackwater stream. When the two types of leaves were incubated in the stream during the fall, there was no significant difference in processing rate. The invertebrate fauna was similar on the two leaf types and did not appear to affect decomposition. However, higher densities of invertebrates were found on green leaves during the final stage of decomposition. Bacterial densities were higher on senescent leaves than on green leaves during the initial phase of decomposition, although green leaves were richer in nutrients. Toxic or inhibitory compounds in the green leaves may override effects of nutrient enhancement on bacterial growth and leaf decomposition. (Agostine-PTT)

EFFECT OF SUBMERSED AQUATIC VEGETATION ON PHYTOPLANKTON AND WATER QUALITY IN THE TIDAL FRESHWATER POTOMAC RIVER.
George Mason Univ., Fairfax, VA. Dept. of Biology.
R. C. Jones.
Journal of Freshwater Ecology JFREDW, Vol. 5, No. 3, p 279-288, June 1990. 2 fig, 1 tab, 24 ref.

Descriptors: *Phytoplankton, *Potomac River, *Submerged aquatic plants, *Tidal rivers, *Vegetation effects, *Water quality, Aquatic weeds, Biomass, Chlorophyll a, Dissolved oxygen, Hydrilla, Hydrogen ion concentration, Macrophytes, Seasonal variation.

Phytoplankton biomass and water quality were determined at two sites in the tidal freshwater Potomac River. At each site three plant treatments were sampled twice each during the summer and the fall. Phytoplankton biomass, as measured by chlorophyll a, was negatively related to macrophyte density. High density Hydrilla beds harbored the least phytoplankton chlorophyll, while low density mixed beds were most similar to the open water areas. This effect was more pronounced in summer than in fall. Variation in dissolved oxygen and pH reflected the standing crop of both phytoplankton and macrophytes. Phytoplankton were the dominant influence in the open water; macrophytes were more important in the dense weedbeds. Greatest variation in temperature was observed in the dense weedbeds. COMPARISON OF DETRITUS PROCESSING BETWEEN PERMANENT AND INTERMITTENT HEADWATER STREAMS.
Central Michigan Univ., Mount Pleasant. Dept. of Biology.
W. B. Richardson.
Journal of Freshwater Ecology JFREDW, Vol. 5, No. 3, p 341-357, June 1990. 6 fig, 5 tab, 55 ref. U.S. D.O.E. Contract DE-AC-09-76SR00819.

Descriptors: *Decomposing organic matter, *Detritus, *Headwaters, *Intermittent streams, *Perennial streams, Alder trees, Ash trees, Biomass, Comparison studies, Food habits, Invertebrates, Leaves, Nitrogen, Seasonal variation.

The pattern of leaf pack decomposition and density and biomass of the associated invertebrate detritivore community of an intermittent and a perennially flowing headwater stream were compared in autumn and spring. Leaf packs of high (Alnus rugosa) and low (Fraxinus americana) nitrogen content were used. Leaf litter was processed at similar rates in both streams during autumn (-k: 0.015 g/d). In spring the decomposition rates more than doubled in the permanent stream (-k>0.03) and only slightly increased in the intermittent stream (e.g. Fraxinus: -k: 0.017). Differences in decomposition rates between leaf species were seen only in the fall in the intermittent stream where Fraxinus litter decomposed slowed than Alnus. Shredder biomass was greater than other invertebrate guilds in both streams, was reduced in the intermittent stream, and varied with season (spring > fall), particularly in the permanent stream. Shredder biomass was greater in Alnus leaf packs. Shredder densities were significantly lower in the intermittent stream, during both seasons, compared with the permanent stream. Greater densities of shredders occurred on Alnus leaf packs. Collectors outnumbered other guilds. The intermittent stream had a depauparate shredder fauna and was numerically dominated by collectors. Lack of shredding detritivores, combined with decreased duration of submersion, resulted in reduced potential for processing of particulate carbon relative to the permanently flowing stream. NEW APPROACH FOR MEASURING COVER IN FISH HABITAT STUDIES.
Auburn Univ., AL. Dept. of Fisheries and Allied Aquacultures.
T. D. Kinsolving, and M. B. Bain.
Journal of Freshwater Ecology JFREDW, Vol. 5, No. 3, p 373-378, June 1990. 2 fig, 1 tab, 20 ref.

Descriptors: *Aquatic habitats, *Fish, Analytical techniques, Mathematical studies.

The most common method for measuring fish cover in fish habitat studies, percent area with cover, produces data that are difficult to analyze, incompatible with data on other habitat variables, frequently subjective, and limited in content. Alternative cover measurement methods used in marine habitats can be more widely used but retain some of the disadvantages of the percent area method. A new approach to measuring cover is based on counting the number of surfaces within a planer section of a water column. Rules for counting surfaces were: (1) solid objects with a diameter greater than 10 cm were counted as two surfaces; (2) objects thinner than 10 cm were counted as a single surface; (3) objects located closer than 3 cm to each other were considered part of the same surface; (4) portions of a cover object which were geometrically separate were counted separately; (5) undercut banks were considered to be cover objects. These rules were designed for quantifying shallow, shoreline microhabitats primarily inhabited by numerous species of small fishes and the rules should be altered to accommodate different study objectives, target fish sizes and microhabitat types. This method is easy, fast, and produces data that can be used to compute three continuously distributed cover parameters: density, complexity, and heterogeneity. Field results are presented to demonstrate how this approach can be used to differentiate species in their use of cover in freshwater basins. (Agostine-PTT)

ISOLATION AND CHARACTERIZATION OF HEPATOTOXIC MICROCYSTIN HOMOLOGS FROM THE FILAMENTOUS FRESHWATER CYANOBACTERIUM NOSTOC SP. STRAIN 152.
Helsinki Univ. (Finland). Dept. of Microbiology.
K. Sivonen, W. W. Carmichael, M. Namikoshi, K. L. Rinehart, and A. M. Dahlem.
Applied and Environmental Microbiology AEMIDF, Vol. 56, No. 9, p 2650-2657, September 1990. 6 fig, 1 tab, 26 ref. USAMRIDD Contract DAMD-17-87-C-7-19. Public Health Service Grants AI04769 and GM27029.

Descriptors: *Cyanophyta, *Eutrophic lakes, *Finland, *Lakes, *Limnology, *Pollutant identification, *Toxins, High performance liquid chromatography, Mass spectrometry, Nostoc, Nuclear magnetic resonance.

A strain of the filamentous cyanobacterium Nostoc sp. isolated from a lake in Finland was found to produce at least nine hepatotoxic peptides with chemical and toxicological properties similar to those of the hepatotoxic hepta-and pentapeptides produced by other cyanobacteria. Toxins were isolated and purified by high-performance liquid chromatography. Amounts available for five of the purified toxins (P6, P14, P15, P16, and P18) were adequate for high-performance liquid chromatography amino acid analysis and determination of molecular weight by fast-atom bombardment-mass spectrometry (FAB-MS). Quantities of three toxins (P14, P15, and P16) were adequate for further analysis by high-resolution FAB-MS, FAB-MS/MS, and H1-nuclear magnetic resonance. Analysis showed that the toxins are new types of microcystin-LR homologs, Microcystin-LR contains equimolar amounts of D-alanine, L-leucine, D-erythro-beta-methylaspartic acid, L-arginine, ADDA (3-amino-9-methoxy-2,6,8-trimethyl-10-phenyl-4,6-decadienoic acid), D-glutamic acid, and N-methyldehydroalanine (molecular weight (MW), 994). Nostoc sp. strain 152 was found to produce the following microcystin-LR homologs: (1) P6 contains an extra methylene group most probably due to the presence of N-methyldehydrobutyrine instead of N-methyldehydroalanine (MW, 1008); (2) P14 is O-acetyl-O-demethyl ADDA-microcystin-LR (MW, 1,022); (3) P15 is 3-demethyl-O-acetyl-lADDA-homoarginine-microcystin-LR (MW, 1,036); (4) P16 is 3-demethyl-O-acetyl-O-demethyl-lADDA-microcystin-LR (MW, 1,008); (5) P18 is 3-demethyl-O-acetyl-O-demethylADDA-homoarginine-microcystin-LR (MW, 1,022). The toxicities of the new microcystin homologs were not significantly different from those of microcystin-LR or demethylmicrocystin-LR. (Author's abstract)

DISTRIBUTION AND RATE OF METHANE OXIDATION IN SEDIMENTS OF THE FLORIDA EVERGLADES.
Aarhus Univ. (Denmark). Inst. of Ecology and Genetics.
G. M. King, P. Roslev, and H. Skovgaard.
Applied and Environmental Microbiology AEMIDF, Vol. 56, No. 9, p 2902-2911, September 1990. 6 fig, 2 tab, 41 ref. NASA Grant NAGW-1406.

Descriptors: *Everglades, *Florida, *Marsh plants, *Methane, *Oxidation, *Sediments, *Wetlands, Light penetration, Marl, Oxygen, Path of pollutants, Peat, Photosynthesis, Roots.

Rates of methane emission from intact cores were measured during anoxic dark and oxic light and dark incubations. Rates of methane oxidation were calculated on the basis of oxic incubations by using the anoxic emissions as an estimate of the maximum potential flux. This technique indicated that methane oxidation consumed up to 91% of the maximum potential flux in peat sediments but that oxidation was negligible in marl sediments. Oxygen microprofiles determined for intact cores were comparable to profiles measured in situ. Thus, the laboratory incubations appeared to provide a reasonable approximation of in situ activities. This was further supported by the agreement between measured methane fluxes and fluxes predicted on the basis of methane profiles determined by in situ sampling of pore water. Methane emissions from peat sediments, oxygen concentrations and penetration depths, and methane concentration profiles were all sensitive to light-dark shifts as determined by a combination of field and laboratory analyses. Methane emissions were lower and oxygen concentrations and penetration depths were higher under illuminated than under dark conditions; the profiles of methane concentration changed in correspondence to the changes in oxygen profiles, but the estimated flux of methane into the oxic zone changed negligibly. Sediment-free, root-associated methane oxidation showed a pattern similar to that for methane oxidation in the core analyses: no oxidation was detected for roots growing in marl sediment, even for roots of Cladium jamaicense, which had the highest activity for samples from peat sediments. The magnitude of the root-associated oxidation rates indicated that belowground plant surfaces may not markedly increase the total capacity for methane consumption. However, the data collectively support the notion that the distribution and activity of methane oxidation have a major impact on the magnitude of atmospheric fluxes from the Everglades. ALGAE, OTHER THAN DIATOMS, AFFECTING THE DENSITY, SPECIES RICHNESS AND DIVERSITY OF DIATOM COMMUNITIES IN RIVERS.
Zurich Univ., Kilchberg (Swizerland). Hydrobiological-Limnological Station.
F. Elber, and F. Schanz.
Archiv fuer Hydrobiologie AHYBA4, Vol. 119, No. 1, p 1-14, July 1990. 5 fig, 1 tab, 50 ref.

Descriptors: *Algal growth, *Diatoms, *Periphyton, *River ecology, *Species diversity, Chlorophyta, Chrysophyta, Cyanophyta, Population density, Rivers, Species composition, Succession, Water pollution effects.

The influence on diatom communities of algae of other groups, including the chrysophyte Hydrurus foetidus, as well as green and blue-green algae, was examined by comparing the algal periphyton of river bottom stones with that of stones imported to the river bed. In spring, H. foetidus biomasses were higher on these imported stones than on river bottom stones; in contrast statistically greater densities of green and blue-green algae on river bottom stones were observed during the investigation period. The mass development of Hydrurus on imported stones diminished the densities of diatoms by reducing their growth rates as a consequence of less available light. According to the dynamic equilibrium hypothesis of Huston (1979), a higher diversity was therefore expected on imported

LIBRARY U. S. GEOLOGICAL SURVEY RESTON, VA

stones than on river bottom stones; this was indeed the case. An increase in the species richness, evenness and diversity was observed. If H. foetidus was absent, the diatom communities on river bottom stones showed higher diversity values than those on imported stones. The much longer exposure time obviously enabled the biological systems to reach a more complex level. In order to avoid undesired effects in future investigations on the structure of diatom communities, sampling substrata lacking mass developments of algae other than diatoms should be selected. (Author's abstract)

STUDY OF AQUATIC COMMUNITY DYNAMICS IN A KARSTIC SYSTEM BY THE USE OF ARTIFICIAL SUBSTRATES.
Lyon-1 Univ., Villeurbanne (France). Lab. d'Hydrobiologie et Ecologie Souterraines.
P. Vervier.
Archiv fuer Hydrobiologie AHYBA4, Vol. 119, No. 1, p 15-33, July 1990. 10 fig, 2 tab, 61 ref.

Descriptors: *Aquatic populations, *Artificial substrates, *France, *Karst, *Karst hydrology, *Population dynamics, *Species diversity, Aquifers, Colonization, Crustaceans, Flooding, Groundwater, Hydrologic data collections, Sampling.

The use of artificial substrates to study aquatic community dynamics in underground environments is more recent than in aquatic surface systems. An artificial substrate consisting of a synthetic rope (0.5 cm in diameter) stuffed into a 20-cm long polyvinyl chloride pipe (10 cm in diameter) containing 1-cm holes was placed in the Foussoubie karstic system of southeast France. Artificial substrates immersed during a one month period or, with less efficiency, during a two month period, showed that karst hydrology plays an important role in the dynamics of karstic system communities. The duration of immersion was less important than the hydrological period during which the artificial substrates were immersed. The importance of floods in the colonization process was demonstrated by the use of the artificial substrates. The artificial substrates placed in the sediments of the stream had higher population densities after a flood than during the low-water period. The use of artificial substrates showed that the number of organisms that settle in the bottom differed according to the facies of the stream (e.g. riffles and pools). Moreover, the artificial substrates method made the study of the migration of epigean organisms into the karstic system possible. (Geiger-PTT)

Descriptors: *Benthos, *Macroinvertebrates, *Piscicides, *Rotenone, *Species composition, *Stream ecology, Mayflies, Population density, Population dynamics, Stoneflies.

Standing stocks and drift of macroinvertebrates from reaches treated with rotenone piscicide were compared with untreated reaches of two low-altitude streams within the Sepik-Ramu River drainage, Papua New Guinea. Total macrobenthic population densities were similar in both streams, although community composition showed significant inter-stream differences. In addition, certain lotic taxa (e.g. Plecoptera) characteristic of the Asian mainland were absent while others (e.g. naucorid bugs) had diversified in their absence. Rotenone induced immediate catastrophic drift: total drift densities peaked after 30 minutes and declined subsequently, showing similar trends in both streams. Taxa varied with respect to both the degree and timing of their response to rotenone, but Baetidae (Ephemeroptera) were rapidly affected and were the most numerous drifting taxa. Certain baetid mayflies declined in abundance in rotenone-treated reaches, although not all morphospecies were affected equally. Standing stocks of leptophlebiid mayflies, by contrast, were unaffected by rotenone application and total invertebrate standing stocks in both streams were unchanged. Overall, rotenone induced catastrophic drift but did not cause large-scale mortality and declines in benthic invertebrate abundance. (Author's abstract)

STUDIES ON THE CHEMISTRY OF INTERSTITIAL WATER TAKEN FROM DEFINED HORIZONS IN THE FINE SEDIMENTS OF BIVALVE HABITATS IN SEVERAL NORTHERN GERMAN LOWLAND WATERS: I. SAMPLING TECHNIQUES.
Tieraerztliche Hochschule Hannover (Germany, F.R.). Inst. fuer Zoologie.
V. Buddensiek, H. Engel, S. Fleischauer-Roessing, S. Olbrich, and K. Waechtler.
Archiv fuer Hydrobiologie AHYBA4, Vol. 119, No. 1, p 55-64, July 1990. 25 ref.

Descriptors: *Fluvial sediments, *Germany, *Interstitial water, *Lake sediments, *Mussels, *Sampling, *Stream biota, Aquatic habitats, Endangered species, Hydrologic data collections, Mollusks.

In the course of sediment studies of freshwater bivalve habitats, a sampling technique for interstitial water, as originally described for rocky beds of running waters by Husmann in 1971 was modified for long term use in sand and gravel sediments of both running and standing lowland waters. The mobile unit allows sampling of 100 ml of interstitial water by means of a safety pipette filler or hand vacuum pump. A partial vacuum is built up in a suction flask connected to one tube of a sampling bottle. The second tube from this bottle leads to the stationary unit to which it is fitted by suitable plastic couplings, so that samples from defined levels can be drawn, after the water standing in the tubes has been discarded. O2-content, conductivity and pH are determined immediately in the sampling bottle. For the laboratory determination of NH4(+), NO3(-), and PO4(3-), samples were chloroform-fixed in the field and then either processed immediately or stored frozen at -20 C until use. The stationary unit allows sampling from defined depths. Interstitial water was taken from 0, 1, 2, 3, 4, 5, 7, 9, 15, 20, 30, and 35 cm sediment depth in a German lowland stream with a population of Unio crassus, a German lowland stream with a Margaritifera margaritifera population, and a lake in the German lowlands with populations of Unio pictorum and Unio tumidus. In running waters some additional levels above 0 had to be sampled to adapt the sampling levels to possible variation of the sediment surface by drifting sand or organic debris. Results of these long-term studies provided data on O2, NH4(+), NO3(-), PO4(3-), pH and conductivity levels in the sediments at various depths and horizon specific seasonal changes in the concentration of several parameters that might affect survival of endangered mussel species in these microhabitats. EXPERIMENTAL USE OF DIALYSIS CHAMBER ARRAYS TO STUDY P-FLUXES IN THE BAY OF QUINTE, 1987.
National Water Research Inst., Burlington (Ontario).
P. G. Sly.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 258-270, 1990. 4 tab, 18 fig, 14 ref.

Descriptors: *Bay of Quinte, *Cycling nutrients, *Dialysis, *Lake Ontario, *Phosphorus, *Pollution load, *Sediment contamination, *Sediment-water interfaces, *Water analysis, *Water pollution control, Analytical techniques, Experimental data, Nitrogen compounds, Organic carbon, Sediment analysis.

Dialysis chamber arrays were used to estimate proportions of the internal phosphorus load derived from degradation of fresh particulates at or near the base of the water column and partly aged bed material in the Bay of Quinte, Lake Ontario. Phosphorus released from partly aged lake bed sediment provided about 20% of the internal load at Hay Bay but the bed acted as sink for much of the time at Picton. At Hay Bay, sediment oxygen consumption rates were high averaging more than 0.6 gO2/sq m/d. Higher oxygen consumption rates characterized Picton sediments during the late summer and early fall and these were accompanied by a slight increase in the rate of phosphorus release. Combined mean P-reflux values derived from these experiments were higher than expected from model predictions based on past Bay of Quinte studies. The higher values may be caused by very rapid degradation of trapped material in the up-facing tubes due to the presence of excessive numbers of benthic invertebrates. (Author's abstract)

ESTIMATING THE VARIATION OF BUOY WIND AND WAVE DATA BIASES.
Atmospheric Environment Service, Downsview (Ontario).
S. Clodman.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 288-298, 1990. 5 tab, 4 fig, 8 ref.

Descriptors: *Buoys, *Calibrations, *Data acquisition, *Data analysis, *Error analysis, *Great Lakes, *Instrumentation, *Wind waves, Model studies, Statistical analysis, Variability, Waves, Wind velocity.

The bias variations of the U. S. National Data Buoy Center buoys located on the Great Lakes were quantitatively estimated by statistical comparisons of wind, speed, wave height and wave period. This was done by direct comparison and by using a wave model to estimate the wave parameters from the wind. The data seem to be consistent for any given station and year. Wave height and period biases remain constant but the wind speed bias does vary up to about plus or minus 15%. The wind speed bias is probably affected by changes in buoy instrumentation. These bias variations can be routinely estimated. The approach allows calibration information to be found from the actual data, replacing or improving calibrations done before or after the data period. (Miller-PTT)

PLANKTONIC PROTOZOA IN LAKES HURON AND MICHIGAN: SEASONAL ABUNDANCE AND COMPOSITION OF CILIATES AND DINOFLAGELLATES.
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
H. J. Carrick, and G. L. Fahnenstiel.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 2, p 319-329, 1990. 3 tab, 3 fig, 64 ref.

Descriptors: *Dinoflagellates, *Lake Huron, *Lake Michigan, *Limnology, *Protozoa, Biomass, Ecosystems, Population density, Seasonal variation.

The abundance and biomass of surface and deep ciliate and dinoflagellate protozoa in the offshore waters of Lakes Huron and Michigan were determined from December 1986 to November 1987. Protozoan abundance (4 to 15 cells/mL) and biomass (13-140 microg/L) were comparable between

lakes and similar to those reported form other oligitrophic environments. Ciliates comprised the majority of protozoan abundance (80%) and biomass (73%). The mean size of these communities was small (20.6 microm) due to the numerical dominance of small choreotrichs, oligotrichs, and species of Gymnodinium. Total biomass in both lakes peaked during late June-July and again during October-November. These seasonal changes in biomass were accompanied by species replacements. Deep and surface communities were comparable in terms of abundance and biomass of ciliates, although deep community biomass decreased as stratification intensified. Because the biomass of ciliates alone represents about 30% of crustacean zooplankton biomass, protozoa may be more important grazers than once thought. (Author's abstract)

Toxigenic and nontoxigenic strains of Vibrio cholerae 01 occur in the natural aquatic environment. It is not clear whether V. cholerae 01 lose toxigenicity and become nontoxigenic during survival in the aquatic environment as a result of the effect of various biophysicochemical conditions (e.g., sunlight, pH, temperature, competition with other bacteria for nutrients, etc.) Five toxigenic strains were exposed to artificial aquatic environments in the presence of a filamentous green alga, Rhizoclonium fontanum, and recovered after different time intervals (0 and 0.5 h, 3, 6, 9, and 15 days). This experimental system was exposed to sunlight and the V. cholerae 01 were in competition for nutrients with resident bacterial flora from R. fontanum. The toxigenicity of Vibrio cholerae 01 that were recovered at different time intervals was assessed by tissue culture assay using Vero cells. The toxigenicity of recovered strains was compared with that of the parent strains. The results demonstrated the toxigenic V. cholerae 01 are unlikely to lose their toxigenicity in aquatic environments as a result of the effects of various biophysicochemical conditions. These results are consistent with the hypothesis of environmental reservoirs of V. cholerae. (Author's abstract)

SELENIUM AS A NUTRIENT FOR FRESHWATER BACTERIOPLANKTON AND ITS INTERACTIONS WITH PHOSPHORUS.
Uppsala Univ. (Sweden). Limnologiska Institutionen.
U. Eriksson, and C. Pedros-Alio.
Canadian Journal of Microbiology CJMIAZ, Vol. 37, No. 7, p 475-483, July 1990. 6 fig, 1 tab, 40 ref.

Descriptors: *Bacteria, *Eutrophic lakes, *Lakes, *Nutrient concentrations, *Oligotrophic lakes, Phosphorus, *Plankton, *Selenium, *Sulfates, Bacterioplankton, Hypereutrophic lakes, Lake Banyoles, Lake Erken, Lake Vallentunasjon, Limnology, Spain, Sweden.

The influence of selenite on the growth of bacterioplankton present in samples of three lakes was analyzed; these samples were collected in sulfate-rich, oligiotrophic Lake Banyoles, moderately eutrophic Lake Erken, and hypereutrophic Lake Vallentunasjon. The addition of P to samples from the lakes Banyoles and Erken enhanced cell yields. Strong effects of phosphate on growth rates were found in samples from lakes Banyoles and Vallentunasjon. Selenite had a significant positive effect on cell yield on samples from lakes Banyoles and Vallentunasjon, whereas the effect on cell yield in samples form Lake Erken was slightly negative. The addition of the selenite alone to samples from Lake Banyoles doubled the biovolume if bacterioplankton within 37 h during the spring. Among winter bacteria from Lake Banyoles, selenite increased the number of bacteria, but only when the phosphate level was high. A high inorganic phosphorus level was also necessary to stimulate the effect of selenite on bacterial growth in samples from Lake Vallentunasjon. The negative effect of selenite on samples from Lake Erken was most obvious when phosphate had been added simultaneously. Cell yields were always greater at the highest temperatures. INTERSTITIAL DISSOLVED ORGANIC CARBON IN SEDIMENTS OF A SOUTHERN APPALACHIAN HEADWATER STREAM.
Georgia Univ., Athens. Dept. of Zoology.
M. T. Crocker, and J. L. Meyer.
Journal of the North American Benthological Society JNASEC, Vol. 6, No. 3, p 159-167, September 1987. 2 fig, 3 tab, 31 ref. NSF Grant No. BSR 85-14328.

Descriptors: *Biomass, *Decomposition, *Dialysis, *Dissolved organic carbon, *Interstitial water, *Limnology, *Organic matter, *Seasonal variation, *Streams, Bacterial productivity, Benthic environment, Chemical analysis, Hyporheos, Sampling, Spatial distribution.

This study had two objectives: (1) to compare seasonal and spatial patterns of water-column dissolved organic carbon (DOC) and sediment interstitial DOC (IDOC) concentrations at a headwater spring seep, and (2) to explore interactions between sediment organic matter content, benthic bacterial biomass and production, water column DOC concentrations, and sediment IDOC concentration and composition (high versus low molecular weight components). For the first objective, sediment organic matter content, IDOC concentration (sampled from small wells by dialysis or by pipet), water column DOC concentration, and benthic bacterial biomass were measured at a spring seep in Coweeta Hydrologic Laboratory, Macon Co. North Carolina USA, for two years. For the second objective, organic matter content was increased or decreased in experimental sediments. The same variables listed above were measured within three weeks of sediment manipulation and again after five and a half month. Benthic bacterial production was measured one week after sediment manipulation. Results indicate benthic organic matter is a source of IDOC, the concentration of which depends on sediment organic matter content, the relative proportion of high and low molecular weight IDOC compounds, and the exchange of interstitial and water column DOC. High molecular weight IDOC (>50,000) concentrations are lower than high molecular weight IDOC concentrations and are independent of sediment organic matter content. However, low molecular weight IDOC concentrations are generally greater than water column total DOC concentrations. Low molecular weight IDOC concentrations are greater during the dominant season than during the growing season. (Author's abstract)

DISTRIBUTION AND PRIMARY PRODUCTIVITY OF THE EPIZOIC MACROALGA BOLDIA ERYTHROSIPHON (RHODOPHYTA) IN A SMALL ALABAMA STREAM.
Alabama Univ., University. Aquatic Biology Program.
M. S. Stock, T. D. Richardson, and A. K. Ward.
Journal of the North American Benthological Society JNASEC, Vol. 6, No. 3, p 168-174, September 1987. 3 fig, 2 tab, 20 ref.

Descriptors: *Algae, *Algal growth, *Epizoic algae, *Limnology, *Primary productivity, *Rhodophyta, *Seasonal variation, *Snails, *Streams, Animal behavior, Autochthonous carbon, Biological samples, Boldia, Gastropods, Sampling, Spatial distribution.

The contribution of autochthonous carbon to a small stream by the epizoic red macroalga Boldia erythrosiphon was determined from December 1985 through April 1986 in Little Schultz Creek, Alabama. Boldia grew almost exclusively on the snail species Elimia clara and E. cahawbensis. A mean of 323 snails/sq m was found in the stream, 49% of which had the alga attached. Elimia clara was nearly four times as abundant as E. cahawbensis and Boldia was significantly more associated with the former than with the latter snail. The differential distribution of the alga may be due to behavioral differences, E. clara preferring erosional sites with higher current rather than depositional sites. Boldia on snails contributed a mean of 37 mg C/sq m/d from January through April 1986 and a total of nearly 2 g C/sq m for the season. The latter value is one third of the seasonal primary production of epilithic algae on cobble measured in a previous study, and, when added to it, changes the annual pattern of autochthonous production in this stream. The productivity of the macroalga illustrates the importance of animals in providing substrata for algae in streams. In addition, to the presence of snails, a combination of factors including total light input, the chemical nature of substrata, differential grazing pressure, and substratum availability may affect colonization and growth of Boldia. (Author's abstract)

Four densities of a snail (Juga silicula) and a caddisfly (Dicosmoecus gilvipes) were introduced into separate laboratory streams, and their effects on algal biomass and community structure were monitored for 32 d. Tiles in an ungrazed control stream were covered by thick algal mats by day 32, and were composed primarily of Scenedesmus spp., Characium, and a variety of diatoms. Biomass and community structure of algal assemblages in the stream with the lowest density of snails were very similar to those in the control stream. In the other streams with snails, an inverse relationship developed between algal biomass and snail density after day 16. By day 32, the algal assemblages in the streams with high snail densities were dominated by adnate diatoms (e.g., Achnanthes lanceolata), and basal cells and short filaments of Stigeoclonium tenue. In contrast to the streams with snails, algal biomass was relatively low in all streams with caddisflies. The differences in algal biomass and structure between the streams with the lowest and highest densities of caddisflies were much smaller than those between streams with the lowest and highest densities of snails. On day 32, the taxonomic and physiognomic structure of the algal assemblages in all the streams with caddisflies resembled that in the streams with higher densities of snails. Scanning electron micrographs showed that even at the highest densities, neither snails nor caddis-

LIBRARY U. OF I. URBANA-CHAMPAIGN

flies could completely remove the algal assemblage. It is concluded that grazing can substantially influence algal growth form and assemblage physiognomy in lotic ecosystems. (See also W91-01807) (Author's abstract)

EFFECTS OF HERBIVORE TYPE AND DENSITY ON CHEMICAL COMPOSITION OF ALGAL ASSEMBLAGES IN LABORATORY STREAMS.
Oregon State Univ., Corvallis. Dept. of Botany and Plant Pathology.
A. D. Steinman, C. D. McIntire, and R. R. Lowry.
Journal of the North American Benthological Society JNASEC, Vol. 6, No. 3, p 189-197, September 1987. 5 tab, 34 ref. NSF Grant Nr. BSR-8318386.

Descriptors: *Algae, *Amino acids, *Biochemistry, *Biomass, *Caddisflies, *Fatty acids, *Laboratory equipment, *Laboratory methods, *Lotic environment, *Snails, Algal growth, Aquatic insects, Chemical composition, Gastropods, Grazing, Laboratory streams.

The chemical composition of algal assemblages in laboratory streams was determined 3 and 27 d after adding snail (Juga silicula) and larval caddisfly (Dicosmoecus gilvipes) grazers. Three days after the herbivores were introduced (day 8 of algal growth), the fatty acid and amino acid profiles among algal assemblages were similar. Substantial differences were noted after 4 wk (day 32 of algal growth), however, especially with respect to the 16:0, 16:1, 16:3, 18:3, and 20:5 fatty acids. On day 32, algal assemblages subjected to zero or 125 snails/stream (66/sq m) had higher levels of glycine, leucine, isoleucine, tyrosine, and the 16: and 18:3 fatty acids than assemblages exposed to 500 snails/stream (250/sq m), 50 caddis/stream (25/sq m), or 200 caddis/stream (100/sq m). On the other hand, assemblages subjected to high grazing pressure (i.e., 500 snails/stream, 50 and 200 caddis/stream) had higher levels of alanine, glutamic acid/glutamine, and the 16:0, 16:1, and 20:5 fatty acids than algae exposed to zero or 125 snails/stream. These data provide detailed information on the food quality of lotic algae and may serve as a starting point for future research on this field. (See also W91-01806) (Author's abstract)

RATES OF PROTOZOAN BACTERIVORY IN THREE HABITATS OF A SOUTHEASTERN BLACKWATER RIVER.
Georgia Univ., Sapelo Island. Marine Inst.
L. A. Carlough, and J. L. Meyer.
Journal of the North American Benthological Society JNASEC, Vol. 9, No. 1, p 45-53, March 1990. 2 fig, 3 tab, 50 ref. NSF Grant Nr. BSR-8705744.

Descriptors: *Aquatic bacteria, *Bacterivory, *Flagellates, *Food chains, *Grazing, *Limnology, *Lotic environment, *Microorganisms, *Protozoa, *Secondary productivity, Aquatic environment, Ciliates, Filter feeders, Fluorescent tracers, Particle size.

Although protozoa have been largely disregarded in the trophic structure of lotic systems, they have been shown to be important in lentic and marine environments. As part of a larger study concerning the basis of secondary production in the Ogeechee River, GA, preliminary experiments were done using fluorescently-labelled bacteria to directly measure bacterial grazing by protozoa. Protozoan grazing rates can be as high in moving lotic waters as in still waters as demonstrated by comparing a main channel site, a backwater, and a floodplain pond. In the main channel site during April and May 1988, flagellates and ciliates ingested an average of 17 and 420 bacteria/individual/hr, respectively. When this is multiplied by the high protozoan densities present, an average of 47% of the water-column in the main channel is estimated to be cleared of bacteria by protists each day. Protozoan bacterivory could facilitate carbon flow to higher trophic levels by turning bacteria into larger parcels of carbon and nutrients which are available to a greater portion of the filter-feeding members of communities. TIMING OF WAVE DISTURBANCE AND THE RESISTANCE AND RECOVERY OF A FRESHWATER EPILITHIC MICROALGAL COMMUNITY.
Louisville Univ., KY. Dept. of Biology.
C. G. Peterson, K. D. Hoagland, and R. J. Stevenson.
Journal of the North American Benthological Society JNASEC, Vol. 9, No. 1, p 54-67, March 1990. 5 fig, 4 tab, 58 ref.

Descriptors: *Algae, *Algal growth, *Algal populations, *Chlorophyll a, *Diatoms, *Fragilaria, *Limnology, *Nitzschia, *Oscillatoria, *Periphyton, *Phaeophyta, *Wave action, *Waves, Epilithic algae, Lake McConaughy.

Microalgal communities on clay tiles in Lake McConaughy (Nebraska, USA) were subjected to simulated wave disturbance after 6, 12, 18, or 24 d of development to examine the effects of community age on resistance and recovery in these communities. Six-day communities were less resistant than older communities; diatom standing crops in 6-d communities were reduced 47.6% by disturbance. Resistance of older communities was apparently a function of increased mat stabilization by diatom mucilages and overlying Oscillatoria surface layers. Diatom density reductions in 6-d communities were due to differential removal of large, chain-forming species of Fragilaria, and solitary, motile Navicula and Nitzschia. Sediment-trap data showed that Fragilaria and Navicula resettled quickly, but that once removed, many Nitzschia were not readily replaced through immigration. Differential removal of diatom taxa by disturbance at 6 d, as well as differential settling of taxa following disturbance affected community recovery patterns. Simulated wave disturbance also caused short-term increases in growth rates of four common taxa in 6-d communities. After 24 d, phaeophytin content of control communities exceeded chlorophyll a concentrations, indicating senescence of algal cells. Communities disturbed after 18 or 24 d had chlorophyll a concentrations similar to controls, but significantly lower phaeophytin content, suggesting that wave disturbance delayed senescence within algal mats. It was concluded that wave disturbance can affect resistance and recovery of epilithic algal communities in lentic systems and that timing of disturbance influences community response. INVERTEBRATE COMMUNITIES OF SMALL STREAMS IN NORTHEASTERN WYOMING.
Geological Survey, Cheyenne, WY. Water Resources Div.
D. A. Peterson.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 85-4287, 1990. 45p, 17 fig, 1 tab, 32 ref. USGS Project No. WY057.

Descriptors: *Invertebrates, *Mine wastes, *Powder River Basin, *Water pollution effects, *Wyoming, Aquatic habitats, Benthic fauna, Benthic flora, Ephemeral streams, Intermittent streams, Perennial streams.

Invertebrate communities of small streams in an energy-mineral-development area in the Powder River structural basin of northeastern Wyoming were studied during 1980-81. The largest average density of benthic invertebrates among 11 sites was 983 invertebrates/sq ft at a site on a perennial stream, the Little Powder River at State Highway 59. The smallest average densities were 3.4 invertebrates/sq ft in Salt Creek and 16.6 invertebrates/sq ft in the Cheyenne River, two streams where the invertebrates were stressed by degraded water quality or inadequate substrate or both. The rates of invertebrate drift were fastest in three perennial streams, compared to the rates in intermittent and ephemeral streams. Analysis of the invertebrate communities using the Jaccard coefficient of community similarity and a cluster diagram showed communities inhabiting perennial streams were similar to each other, because of the taxa adapted to flowing water in riffles and runs. Communities from sites on ephemeral streams were similar to each other, because of the taxa adapted to standing water and vegetation in pools. Communities of intermittent streams did not form a group; either they were relatively similar to those of perennial or ephemeral streams or they were relatively dissimilar to other communities. The communities of the two streams stressed by degraded water quality or inadequate substrate or both, Salt Creek and the Cheyenne River, were relatively dissimilar to communities of the other streams in the study. REVISED ESTIMATE OF THE LIFE SPAN FOR LAKE NASSER.
Florida Univ., Gainesville. Dept. of Civil Engineering.
S. E. Smith.
Environmental Geology and Water Sciences EGWSEI, Vol. 15, No. 2, p 123-129, March/April 1990. 5 fig, 2 tab, 11 ref.

Descriptors: *Aswan High Dam, *Lake Nasser, *Lakes, *Nile River, *Reservoir silting, *Sedimentation, Egypt, Forecasting, Hydrologic data collections, Hydrology, Mathematical studies, Reservoir operation, Sudan, Suspended sediments.

A number of estimates of the potential life span of Lake Nasser located in Egypt and Sudan have been made in the past several years. Published estimates range from as little as 20 years to over 1500 years. The wide range of differing values is a function of many variables, including computation method, input data, and theoretical assumptions underlying the mathematical approach taken. Such a broad range of values is typical of sedimentation studies performed for areas that lack an adequate historic data base. One of the chief constraints to development of a reliable estimate of Lake Nasser's case has been lack of sufficient historical data on which to construct a useful data base. Enough information of this type has been collected since the reservoir's formation in 1964 to permit a realistic assessment of its life span. Granted the obvious need to determine the useful lifetime of this or any other reservoir, it is now possible to assess the reliability of the current official estimate for Lake Nasser. By applying appropriate modifications and additional data to the official estimate, an improved estimate was made. The time forecasted for filling of the reservoir by the official estimate is

362 years, somewhat less than the original design life of 500 years. By taking into account changes in the hydrological regime of the Nile after 1964 and another compaction factor, an estimate of 535 years was made. The additional time before filling estimated in the revision is significant for decision rules governing operation of the Aswan High Dam. (Author's abstract)

NUTRIENT EXCHANGES BETWEEN THE WATER COLUMN AND A SUBTIDAL BENTHIC MICROALGAL COMMUNITY.
Virginia Inst. of Marine Science, Gloucester Point.
W. M. Rizzo.
Estuaries ESTUDO, Vol. 13, No. 3, p 219-226, September 1990. 5 fig, 29 ref.

Descriptors: *Benthic environment, *Estuaries, *Estuarine environment, *Nutrient transport, *River sediments, Algae, Ammonium, Nitrates, Nitrites, Phosphates, Virginia, Water column, York River.

The exchange of nutrients between the shallow (ca. 1 m) sediments and the water column in the York River, Virginia, were measured during 1983 using transparent and opaque plexiglass hemispheres. The exchange of nitrates and phosphates were not significantly different between dome treatments, but ammonium release was significantly reduced within the transparent domes. Within the dark domes, ranges of hourly rates of ammonium and phosphate exchange were -21 to 364 N micromol/sq m and -3 to 76 micromol P/sq m, while those in the transparent domes were -162 to 44 and -6 to 80, respectively. Negative values denote uptake by the sediment. Nitrate + nitrite exchanges averaged only 15% of the total dissolved inorganic nitrogen exchange in the dark domes and 17% of the total dissolved inorganic nitrogen exchange in the transparent domes. Long-term measurements of flow through Calcasieu Pass, Louisiana, are compared to water level variations within Calcasieu Lake, Louisiana. Except during periods of freshets driven by local rainfall, the exchange is shown to be predominantly barotropic. A simple wind driven model accounts for the observed phase relations between wind, current, and water level. Calcasieu Lake is a broad, shallow estuary characterized by minor freshwater runoff, moderate tidal energy, and, except in summer, strong wind stress events. This situation is conducive to barotropic subtidal exchanges with the coastal ocean on time scales of 3 to 10 d. These exchanges are important for the recruitment of larval fish to the estuarine nursery grounds, and may be adequately monitored without costly current meter deployments, using only tide gage measurements. During low wind and high runoff events, stratification and a baroclinic flow regime may develop. These are times when water exchange with the shelf can not be predicted from tide gauge data. A simple linear wind-driven model of the barotropic exchange has been successful in hindcasting the energy containing exchanges when cold fronts are the dominant synoptic weather pattern. The model assumes, without supportive data, that the coastal sea level rise is a significant fraction of that occurring within Calcasieu Lake. (Lantz-PTT)

GROWTH OF SUBMERGED MACROPHYTES UNDER EXPERIMENTAL SALINITY AND LIGHT CONDITIONS.
University of Southwestern Louisiana, Lafayette. Dept. of Biology.
R. R. Twilley, and J. W. Barko.
Estuaries ESTUDO, Vol. 13, No. 3, p 311-321, September 1990. 8 fig, 1 tab, 48 ref.

Descriptors: *Light intensity, *Macrophytes, *Salinity, Biomass, Chlorophyll a, Comparison studies, Estuaries, Nitrogen, Plant growth, Plant physiology, Sodium, Solar radiation, Tissue analysis.

The growth, morphology, and chemical composition of Hydrilla verticillata, Myriophyllum spicatum, Potamogeton perfoliatus, and Vallisneria americana were compared among different salinity and light conditions. Plants were grown in microcosms (1.2 cu m) under ambient photoperiods adjusted to 50% and 8% of solar radiation. The culture solution in 5 pairs of tanks was gradually adjusted to salinities of 0, 2, 4, 6 and 12%. With the exception of H. verticilla, the aquatic macrophytes examined may be considered eurysaline species that are able to adapt to salinities one-third the strength of sea water. With increasing salinity, the inflorescence production decreased in M. spicatum and P. perfoliatus, yet asexual reproduction in the latter species by underground buds remained constant. Stem elongation increased in response to shading in M. spicatum, while shaded P. perfoliatus had higher concentrations of chlorophyll-a. In association with high epiphytic mass, chlorophyll-a concentrations in all species were greatest at 12%. The concentration of sodium increased in all four species of aquatic macrophytes examined, indicating that these macrophytes did not possess mechanisms to exclude this ion. The nitrogen content (Y) of the aquatic macrophytes tested increased significantly with higher sodium concentration (X), suggesting that nitrogen may be utilized in osmoregulation (Y = X x 0.288 + 6.10, r sq = 0.71). The tolerance of V. americana and P. perfoliatus to salinity was greater in this study compared to other investigations. This may be associated with experimental methodology, whereby macrophytes were subjected to more gradual rather than abrupt changes in salinity. The two macrophytes best adapted to estuarine conditions in this study by exhibiting growth up to 12%, included M. spicatum and V. americana, which also exhibited a greater degree of response in morphology, tissue chemistry (including chlorophyll content and total nitrogen), and reproductive output in response to varying salinity and light conditions. STABILITY OF PERIPHYTON AND MACROINVERTEBRATES TO DISTURBANCE BY FLASH FLOODS IN A DESERT STREAM.
Arizona State Univ., Tempe. Dept. of Zoology.
N. B. Grimm, and S. G. Fisher.
Journal of the North American Benthological Society JNASEC, Vol. 8, No. 4, p 293-307, December 1989. 7 fig, 2 tab, 63 ref. NSF grant BSR 84-06891.

Descriptors: *Arizona, *Deserts, *Macroinvertebrates, *Periphyton, *River ecology, *Streams, *Succession, Flooding effects, Life cycles, Limiting nutrients, Nitrogen, Seasonal variation.

Resistance, resilience, and patterns of succession were evaluated for periphyton and macroinvertebrates of Sycamore Creek, Arizona, between 1984 and 1987. During this period, 35 flash-flood disturbances occurred, ranging in magnitude (peak discharge) from 0.2 meters cubed per second to 58 meters cubed per second; peak discharge of the largest flash floods exceeded base flow by 3-4 orders of magnitude. Macroinvertebrates and algal assemblages dominated by diatoms were more resistant, i.e., showed less change in response to spates, than macroalgae (filamentous Chlorophyta) and cyanobacterial mats, but resistance of all groups declined with increasing disturbance magnitude. Biota showed little resistance to events large enough to move substrata. Twenty sequences of postflood succession were analyzed to characterize resilience and patterns of recovery. Resilience was very high compared with other streams and other ecosystems, because of high rates of biotic production in this desert stream. Resilience of periphyton (as indicated by recovery of total chlorophyll a) was highest in summer and autumn, while macroinvertebrate resilience (in terms of density or biomass) did not differ among seasons. In many sequences, recovery curves of macroinvertebrate and algal standing crops were linear or asymptotic; however, macroinvertebrates declined precipitously during later stages of five successional sequences, primarily because of declines in the dominant collector-gatherers. These organisms reproduce continuously and have short life cycles, so declines cannot be explained by synchronous emergence. Instead, declines may be caused by food quality limitation. Sustained high rates of macroinvertebrate consumption and use of autochthonous detritus are possible only if bacterial conditioning (and immobilization of nitrogen) can increase the N content of this material, which is halved with each gut passage. During many sequences, bacterial conditioning is probably limited by nitrogen, which is known to limit autotrophic processes in this stream. This suggests that productivity at higher trophic levels may be influenced by availability of a limiting nutrient not only to primary producers but to microconsumers. (Author's abstract)

DISCHARGE-EXPORT RELATIONSHIPS IN HEADWATER STREAMS: THE INFLUENCE OF INVERTEBRATE MANIPULATIONS AND DROUGHT.
Georgia Univ., Athens. Dept. of Entomology.
T. F. Cuffney, and J. B. Wallace.
Journal of the North American Benthological Society JNASEC, Vol. 8, No. 4, p 331-341, December 1989. 6 fig, 4 tab, 28 ref. NSF grants BSR 83-16082 and BSR 87-18005.

Descriptors: *Appalachian Mountains, *Drought effects, *Flow discharge, *Invertebrates, *Organic matter, *Particulate matter, *Streams, Drought, Headwaters, Insecticides, Methoxychlor.

The role of physical (discharge) and biological (macroinvertebrate communities) factors in the control of coarse (greater than 4 mm) and fine (less than or equal to 4 mm and greater than 0.5 micrometers) particulate organic matter (FPOM) transport was studied in three headwater streams of the southern Appalachian Mountains. The role of discharge was determined by relating two years of continuous measurements obtained over discrete (ca. 2-wk) time intervals. The role of macroinvertebrates was examined by treating one of the three streams, C 54, with an insecticide during Year 2 to reduce populations and alter community structure. Maximum discharge was the only discharge parameter which adequately predicted (linear regressions) FPOM export during a sampling interval (r squared > or -0.70). These regressions were unique for each stream and were constant between years for the untreated streams, despite a record drought during the second year. Relationships between discharge and export of coarse particulate organic matter (CPOM) were not as strong nor as consistent as those for FPOM. CPOM export was very sensitive to timing of CPOM inputs and storms (e.g., 78 to 88% of CPOM export during Year 2 occurred during a single fall storm). Consequently, CPOM export-discharge relationships differed not only among streams but also between years and did not show treatment effects. Treating C 54 with methoxychlor during Year 2 resulted in massive invertebrate drift and drastically reduced populations of macroinvertebrates, practically eliminating shredders and collector-filterers. Maximum discharge continued to be a good predictor of FPOM export (r squared = 0.83) for C 54

during the treatment year, but the yield of export per unit of maximum discharge (slope of the discharge-FPOM export regression) decreased by 65%. This contrasts with the untreated streams in which the slopes were constant between years despite the greater than 50 year drought during Year 2. Most (75%) of the decrease in FPOM yields from C 54 is directly attributable to the reduction in macroinvertebrates. Only 25% is attributable to the drought even though stream flows dropped by ca. 40% during Year 2. (Author's abstract)

SPATIAL AND TEMPORAL DISPERSION PATTERNS OF GOLDEN PERCH, MACQUARIA AMBIGUA, LARVAE IN AN ARTIFICIAL FLOODPLAIN ENVIRONMENT.
New South Wales Dept. of Agriculture, Narrandera (Australia). Inland Fisheries Station.
P. C. Gehrke.
Journal of Fish Biology JFIBA9, Vol. 37, No. 2, p 225-236, August 1990. 5 fig, 6 tab, 25 ref.

Descriptors: *Fish, *Flood plains, *Perch, *Ponds, *Spatial distribution, *Temporal distribution, Aquatic habitats, Fish stocking, Larvae, Thermal stratification, Water quality.

Golden perch larvae were stocked into a pond and inundated floodplain system in south-eastern Australia to determine movement patterns of the larvae onto and off the floodplain area. A total of 428 larvae were caught moving from the floodplain into the pond whereas only 18 were collected moving in the reverse direction. Thirty one larvae were caught at open water sites in the pond and floodplain, but only three were collected from sites on the floodplain which provided shade, timber or water flow. Transect samples from the pond also yielded more larvae than samples from floodplain transects, indicating a distinct spatial dispersion pattern in favor of the pond. Spatial dispersion patterns of golden perch larvae appear to correspond with gradients in water quality between the pond and floodplain habitats. Stratification occurred in the pond but did not develop on the floodplain. Water on the floodplain was cooler, harder and contained less oxygen than surface water from the pond. Diel oscillations occurred in water temperature, pH, dissolved oxygen, carbon dioxide and acidity, but there was no significant corresponding pattern in the distribution of larvae. Dispersion of golden perch larvae between pond and floodplain habitats is not random, and may be actively influenced by local-scale variations in water quality. (Author's abstract)

HEAT CONTENTS, THERMAL STABILITIES AND BIRGEAN WIND WORK IN DYSTROPHIC TASMANIAN LAKES AND RESERVOIRS.
University of New England, Armidale (Australia). Dept. of Botany.
L. C. Bowling.
Australian Journal of Marine and Freshwater Research AJMFA4, Vol. 41, No. 3, p 429-441, 1990. 5 fig, 3 tab, 23 ref.

Descriptors: *Dystrophic lakes, *Enthalpy, *Limnology, *Reservoirs, *Tasmania, *Thermal stratification, *Wind effects, Energy cycle, Heat budget, Mixing.

Values of whole-lake standard energy parameters (heat content, thermal stability, and Birge's work of the wind) for ten dystrophic standing waters from western Tasmania were lower than expected for lakes of their depth and area. Although controlled principally by morphometric factors, the degree of shelter from wind and the extent of each lake's dystrophy also had considerable effects. These factors allowed only surface waters to contribute to the annual heat exchange cycle, thereby reducing the magnitude of each lake's heat budgets and influencing stability and wind work values. The lakes show considerable short term and long term fluctuations in heat content, stability and wind work in response to the capricious maritime meteorological conditions of the area. However, long periods between successive sampling may have caused some underestimation of the ranges of these three parameters. Despite this, the study reveals that these standard energy parameters are effective in describing the annual energy input and resistance to wind-induced mixing of these dystrophic Tasmanian lakes. CLIMATE AND VEGETATION IN CHINA. III. WATER BALANCE AND DISTRIBUTION OF VEGETATION.
Osaka Univ. (Japan). Faculty of Science.
J. Y. Fang, and K. Yoda.
Ecological Research (Kyoto) ECRSEX, Vol. 5, No. 1, p 9-23, April 1990. 7 fig, 5 tab, 49 ref.

Descriptors: *China, *Climatology, *Moisture profiles, *Soil-water-plant relationships, *Vegetation effects, *Water budget, Coniferous forests, Deciduous forests, Deserts, Evapotranspiration, Steppes.

Distributions of 29 vegetation types in China as a function of climatic humidity or aridity were analyzed using Thornthwaite's system, by employing meteorological records from 671 stations in China. The annual potential evapotranspiration and the humidity/aridity indices were calculated for every station, and distribution maps of water deficiency, water surplus and moisture index (Im) were constructed. The Im map showed that arid areas ($Im<0$) occupied about 56% of the country. The effect of the difference in soil water storage capacity on Thornthwaite's indices was examined, and Im values were found to differ little, although some differences were observed in actual annual evapotranspiration, water deficiency and water surplus values. Correlations between Im values and distributions of 29 vegetation types, identified from a vegetation map with a scale of 1/4,000,000, were investigated. The distributions of desert, steppe, woodland, deciduous forest and evergreen forest corresponded to Im values of below -40, -40 to -20, -20 to 0, 0 to 60 and over 60, respectively. In addition, climatic factors delimiting the northern distribution of evergreen broadleaf forest were investigated, and it was clarified that the northern limit was restricted by combined hydrothermal conditions, and not by the low temperature in winter. Production of total forage dry matter is mainly a function of available soil water and soil nitrogen (N), whereas plant morphological development from spring greenup to anthesis is primarily controlled by air temperature. There is a lack of

information on the effects of soil water and soil N on plant morphological development. A study was conducted in a rain-out shelter at Mandan, North Dakota, over a three year period to determine the effect of 2 fertilizer N rates (11 and 110 kg N/ha) and three rates of applied water (50, 100, and 150% of long-term April-November rainfall at Mandan, North Dakota) on the morphological development of initial spring growth and fall regrowth of crested wheatgrass (Agropyron desertorum) and western wheatgrass (Pascopyrum smithii). Regression analysis of plant development stage with accumulated growing degree days (GDD) was linear for both initial and regrowth forage. There were no differences in the rate of plant development for the three rates of applied water or the 2 rates of N fertilizer. Initial growth forage of crested and western wheatgrass required 82 and 98 GDD to produce a leaf, respectively. Regrowth forage of crested wheatgrass required 372 and western wheatgrass 135 more GDD than initial growth to produce a leaf. These data confirm that plants develop primarily in response to air temperature and not added water or N, which enhances the utility of using the accumulation of GDD for predicting development of crested and western wheatgrass under different growing conditions. This information can be useful for predicting plant development of these species in growth models, and for farmers and ranchers in predicting grazing readiness. (Author's abstract)

INFLUENCE OF ORGANIC SEDIMENT AMENDMENTS ON GROWTH AND TUBER PRODUCTION BY POTAMOGETON PECTINATUS L.
Agricultural Research Service, Davis, CA. Aquatic Weed Control Research Lab.
D. F. Spencer.
Journal of Freshwater Ecology JFREDW, Vol. 5, No. 3, p 255-263, June 1990. 3 fig, 2 tab, 19 ref.

Descriptors: *Aquatic plants, *Aquatic soils, *Plant growth, *Sago pondweed, *Sediments, *Soil amendments, *Soil-water-plant relationships, Macrophytes, Nutrients, Organic compounds, Organic matter, Peat, Sugars.

Results from experiments with Potamogeton pectinatus L. grown in an artificial substrate amended with various combinations of peat and glucose or sucrose suggest that plant weight and the number of tubers produced per plant increased significantly when plants were grown in sediment amended with peat. Contrary to expectations, the addition of labile organic components, glucose or sucrose, to the substrate (up to 15%, w/w) did not influence plant growth. Plants grown in sediment amended with peat had higher levels of tissue Fe. The weight of tubers produced per gram of non tuber tissue was not influenced by sediment properties. These results support the hypothesis that the mechanism by which sediment organic matter affects macrophyte growth is by altering sediment density. (Author's abstract)

When the hydrostatic pressure within the protoplast drops below 1 bar (0.1 MPa), i.e., when the turgor pressure becomes negative while the external pressure is atmospheric at one bar, the plant cell is exposed to a compressive stress and will collapse if the stress is sufficiently great. A method is described to measure the strength of cell walls to resist such a collapse. Pressure differences of much less than 0.1 MPa suffice to cause collapse of cells in mesophyllic tissues. In contrast, some Mediterranean and desert plants contain cells with thickened walls that exhibit considerable resistance to collapse. Smaller cells, as are often observed under drought also improve the resistance to collapse. Ephemeral desert plants or organs again show mesophyllic tissues with only nominal resistance. The hypothesis is forwarded that sclerophylly is a mechanism of adaptation to drought if a sufficient quantity of water is available to the plant to survive year round. This is the case for Mediterranean shrubs and trees growing in the desert along ground water courses where the available water is increased by an influx of water from other areas. Desert plants that have to rely solely on local precipitation show a phenological adaptation with mesophyllic tissues. (Author's abstract)

Descriptors: *Path of pollutants, *River sediments, *Sampling, *Sediment transport, *Suspended sediments, *Trace elements, River mechanics, Spatial variation, Temporal distribution, Time series analysis.

Detailed sampling and subsequent analyses of riverine suspended sediment obtained from six rivers in the US (Cowlitz River, San Joaquin River, Arkansas River, West Fork Big Blue River, Des Plaines River, North Fork Kentucky River) indicate substantial differences in suspended sediment concentrations and possibly in some associated trace elements, depending on whether depth and width-integrated, point, or pumping samples are used. In addition, the data from time series, depth-integrated sampling indicate that there can be substantial short-term (on the order of 20-30 minutes) spatial and/or temporal variations in suspended sediment concentrations. Despite this, major element concentrations are remarkably stable both spatially and temporally. Trace element concentrations are generally stable; however, some spatial and temporal variations may occur. (Author's abstract)

FLOW AND PARTICLE PATHS AT A NATURAL RIVER CONFLUENCE WITH COARSE BED MATERIAL.
Montreal Univ. (Quebec). Dept. of Geography.
A. G. Roy, and N. Bergeron.
Geomorphology GEMPEZ, Vol. 3, No. 2, p 99-112, June 1990. 8 fig, 23 ref.

Descriptors: *Channel morphology, *Geomorphology, *River beds, *River flow, *River sediments, *Sediment transport, Flow velocity, Gravel, River mechanics.

An investigation of flow and particle trajectories was conducted at a gravel bed confluence where the junction angle is gradually reduced from 60 to 20 degrees as the tributary joins the main channel. A shallow and elongated scour zone is present at the mouth of the tributary. Three flow stages ranging from 1/7 to 1/2 bankfull were recorded. Flow velocity vectors were measured from 5 bridges installed across the channels. Sediment transport paths were determined by following the progression of seeded marked particles through the confluence from May to October 1986. The results show that flow structure is responsive to stages. At lower stages (less than 1/3 bankfull) flow velocity vectors are controlled by local bed topography and specifically by the steeper slopes around the scour zone. At higher stages, velocity vectors become aligned with the plain geometry of the confluence. For all stages, surface flow velocities are higher in the scour zone. Bed shear stress computed from the law of the wall for the deepest flow is higher at the bottom of the scour zone compared to its side, head and exit. The trajectories of the particles seeded on the tributary pass through the scour zone. Particles coming from the main channel displayed a dual pattern first moving laterally towards the scour zone early in the season then following paths that are consistent with the palin geometry of the confluence. The shift in pattern reflects an increase in the peak discharges during the survey period. These results highlight the role of siege in controlling the flow dynamics and particle paths at the confluence. (Author's abstract)

VARIABILITY OF WATER REPELLENCE IN THE DUNES ALONG THE DUTCH COAST.
Amsterdam Univ. (Netherlands). Lab. for Physical Geography and Soil Science.
P. D. Jungerius, and J. H. de Jong.
Catena, Vol. 16, No. 3, p 491-497, June 1989. 2 fig, 3 tab, 15 ref.

Descriptors: *Erosion, *Soil water, *The Netherlands, *Water repellent soils, Organic matter, Soil profiles, Spatial distribution, Temporal distribution, Wind erosion.

The grey dunes along the Dutch coast are more sensitive to erosion by slope wash than erosion by wind, because the grey sand is extremely water repellant when dry. On the other hand, slope wash triggers wind erosion because the removal of the grey sand exposes the yellow sand which is sensitive to wind erosion. Water repellance of dune soils can best be measured with the waterdrop penetration time (WDPT); however, temporal and spatial variability of the WDPT values is high. There is a complex relationship between water repellance and organic matter content; age of organic matter appears to be more important than type of vegetation cover. Surface water repellance is generally much lower than the water repellance of the A horizon below the depth of a few millimeters, possibly due to the presence of algae. (Author's abstract)

VARIABILITY OF PARTICLE SIZE CHARACTERISTICS OF SHEETWASH SEDIMENTS AND FLUVIAL SUSPENDED SEDIMENT IN A SMALL SEMIARID CATCHMENT, KENYA.
Toronto Univ. (Ontario). Dept. of Geography.
R. A. Sutherland, and R. B. Bryan.
Catena, Vol. 16, No. 4/5, p 189-204, August/October 1989. 5 fig, 5 tab, 51 ref.

Descriptors: *Erosion, *Particle size, *Sediment transport, *Sedimentation, *Semiarid climates, *Suspended sediments, *Watersheds, Catchments, Kenya, Mathematical models, Pollution load, Soil types, Storms.

The variability of particle size characteristics for sheetwash sediments and fluvial suspended sediments are investigated in three representative storm events in a small 0.30 sq km erodible semiarid catchment. Suspended sediment output per event ranged from 340 to 810 t/sq km. Ninety-eight percent of the suspended sediment was less than 63 microm, and was supplied from remobilization of stored coluvium. Discharge and particle size class relationships were complex for various storm events, but were best described by third-order polynomial functions. Results of a one-way analysis of variance showed that concentrations of total suspended sediment, silt and sand varied significantly between storm events. Temporal variation of clay concentration in runoff waters were not significant, suggesting that a single hillside source area contributed to the channel subsystem. The mean grain size and sorting of sheetwash sediments were significantly different from fluvial suspended sediment for individual storm events. Sheetwash sediments were coarser and more poorly sorted than fluvial suspended sediments. Enrichment ratios indicated selective erosion and transport of silt and clay, and preferential deposition of sands. If continuous measurements of suspended sediment concentrations are not available, rating curves must be established to predict catchment sediment loads and transport of contaminants from discharge data. Development of individual rating curves for the geochemically active fractions, silt and primarily clay-sized particles, would improve the estimates of nutrients and contaminant loads transported from drainage basins. (Brunone-PTT)

SPATIAL SCALE DEPENDENCE OF SEDIMENT DYNAMICS IN A SEMI-ARID BADLAND DRAINAGE BASIN.
Alberta Univ., Edmonton. Dept. of Geography.
D. H. de Boer, and I. A. Campbell.
Catena, Vol. 16, No. 4/5, p 277-290, August/October 1989. 6 fig, 2 tab, 29 ref.

Descriptors: *Drainage area, *Geomorphology, *Runoff, *Sediment transport, *Sedimentation, *Semiarid climates, *Watersheds, Hysteresis, Rainfall, Sandstones, Sediment concentration, Sediment discharge, Shales, Topography.

Problems of spatial scale transference are of key interest in drainage basin research. The objective of this study was to investigate the spatial scale dependence of sediment dynamics in semi-arid badland drainage basins. Simulated rainfall experiments indicated that on microscale plots runoff generation and sediment entrainment occurred when total rainfall exceeded 0.5 to 6 mm on pediment surfaces, 1.5 to 4 mm on sandstone surfaces, and 8 to 25 mm on shale surfaces. The sediment concentration/discharge relationship for two mesoscale basins displayed a change from clockwise to counterclockwise hysteresis when total rainfall for the initiation of flow in deep tunnel systems. The initiation of tunnel flow causes counterclockwise hysteresis due to a delayed increase in sediment concentrations during a runoff event. This state contrasts with the clockwise hysteresis caused by flushing in the early stages of runoff for smaller rainstorms. Comparison of microscale and mesoscale sediment dynamics indicates that microscale thresholds are not by necessity in evidence at the mesoscale. In addition, at the mesoscale, elements exist which are non-existent at the microscale, e.g. a deep tunnel system. The behavior of the mesoscale basin is dominated by these elements rather than by the microscale components it contains. (Author's abstract)

Loess soil samples obtained from Wangjiagou, Lishi, China were subjected to laboratory simulated rainfall at intensities of 72 mm/hr for a range of durations from 1 to 30 minutes. Measured splash loss was found to relate to a soil strength index 1/(Psub20) squared. In this index, Psub20 is defined as penetration by a standard fall cone penetrometer at a moisture content of 20% and estimated from penetration-soil moisture regression equations. Similarly, subsequent splash loss of crust samples over a 10-minute period is significantly related to the antecedent soil strength index. As a result of crust development, strength of the surface soil is increased by as much as eleven times, while splash loss is reduced by a maximum of 76%. Data on splash loss and crust strength were used to infer that crust and seal development, while tending towards increasing stability as has been suggested previously, appear to follow a cyclic process of crust formation and disruption. This inference is supported by micromorphological observations. (Author's abstract)

PRODUCTION AND CARBON ISOTOPIC COMPOSITION OF BACTERIAL CO2 IN DEEP COASTAL PLAIN SEDIMENTS OF SOUTH CAROLINA.
Geological Survey, Columbia, SC. Water Resources Div.
P. B. McMahon, D. F. Williams, and J. T. Morris.
Ground Water GRWAAP, Vol. 28, No. 5, p 693-702, September/October 1990. 7 fig, 3 tab, 32 ref.

Descriptors: *Carbon dioxide, *Carbon isotopes, *Coastal plains, *Diagenesis, *Geochemistry, *Marine sediments, *Water chemistry, Bacteria, Organic matter, South Carolina.

Geochemical data accumulated since the 1940s have provided indirect evidence that bacterial CO2 can significantly impact the chemical evolution of groundwater. Recent data strongly suggest that bacterial CO2 is an important reactant in groundwater. Rates of bacterial CO2 production in laboratory incubations ranged from 0 to 2,750 nanomoles of CO2 per gram of South Carolina Coastal Plain sediment per day. On average, CO2 production was greater in downdip sediments than in updip sediments. There was no relation between CO2 production and total organic carbon content of the sediment. The carbon isotopic composition of bacterial CO2 ranged from -29.7 to -18.0 per mil and is controlled in part by the isotopic composition of the sedimentary organic matter from which the CO2 is derived. The isotopic composition of CO2 from downdip sediments was enriched in 13-carbon by 5% on average, relative to CO2 from updip sediments. Measurements of the production and carbon isotopic composition of bacterial CO2 given here provide evidence linking bacterial CO2 to dissolved inorganic carbon in Coastal Plain aquifers of South Carolina. Descriptors: *Flow channels, *Flow velocity, *Sediment transport, *Sedimentation rates, *Suspended solids, *Water depth, Club mosses, Ecological distribution, Plankton, Sinking rate, Spores, Suspension.

An experimental study was designed to test the hypothesis that the loss of particles from suspension in flowing water follows an exponential decay function (the exponent is influenced more by water depth than water velocity). Successive experiments used suspensions of Lycopodium spores which were introduced into one of the circulating channels maintained at its Waterston site, Dorset, under different combinations of water depth and pumping rate. In each experiment the concentration of introduced spores declined exponentially through time. The bulked, transformed data-set also conformed well to a single regression against a common time scale which explained over 94% of the accumulated variances. The variance unexplained by the regression was apportioned among the components distinguishing between experiments: experimental differences in starting concen-

tration, water depth and pumping rate (velocity). This analysis revealed that, after elimination of different initial concentrations, only water depth produced a significant effect, through its relation to the settling velocity of the Lycopodium. Therefore, water depth and not flow velocity proved to be the main controlling variable determining the rate of sinking loss in these experiments. Nevertheless, flow velocity is an important component in the sense that it influences the horizontal distance traveled by the residual spore suspension through the time period required for complete settlement. In applying the findings to the maintenance of planktonic diatoms in rivers, it was found that both the survival of a potential growth inoculum and its downstream dispersion are strongly time-dependent and are enhanced by greater channel depths. SILTATION OF STONE-SURFACE PERIPHYTON IN RIVERS BY CLAY-SIZED PARTICLES FROM LOW CONCENTRATIONS IN SUSPENSION.
Otago Univ., Dunedin (New Zealand). Dept. of Zoology.
A. A. Graham.
Hydrobiologia HYDRB8, Vol. 199, No. 2, p 107-115, July 24, 1990. 2 tab, 43 ref.

Descriptors: *Clays, *New Zealand, *Periphyton, *Rivers, *Silting, *Suspended sediments, Food chains, Macroinvertebrates, Particle size, Sediment deposition, Streambeds, Turbidity.

The observation that deposits of fine sediment are found on stream beds only in areas of slower water velocity promotes a common misunderstanding of the depositional behavior of fine suspensoids in flowing water and a disregard for the potential for siltation effects on the biota on the surface of stones in fast flowing water. A model for deposition from turbulent water, whereby particles are lost from suspension where water currents are slowed by boundary friction, provides an explanation for silt infiltration into epilithic periphyton. Theoretically calculated deposition rates of clay sized mineral particles at low suspended concentrations (2 to 5 g/cu m) were found to account for observed rates of silt accumulation in epilithic periphyton in a braided river in the South Island of New Zealand. At concentrations between 1 and 10 g/cu m of suspended mineral silt during normal flow, silt accumulation in epilithic periphyton accounted for about 50% of its dry weight. This caused a reduction in the mean organic content of the periphyton to 22% of the dry weight compared to 52% in a reference stream where the concentration of suspended mineral particles was less than 1.0 g/cu m during non-freshet flow. Siltation of periphyton reduces its value/availability as food for the aquatic macroinvertebrates that unselectively consume periphyton. Food value can be a major influence on several aspects of invertebrate production: density, growth rate, survival, size at pupation, emergence success, and fecundity. The effect of fine silt deposition on the organic-inorganic proportions of the periphyton will vary, depending on the growth rate of the periphyton standing crop relative to the rate of accumulation of inorganic silt. ESTIMATE OF SNOW AVALANCHE DEBRIS TRANSPORT, KAGHAN VALLEY, HIMALAYA, PAKISTAN.
Waterloo Univ. (Ontario). Dept. of Geography.
I. Bell, J. Gardner, and F. de Scally.
Arctic and Alpine Research ATLPAV, Vol. 22, No. 3, p 317-321, August 1990. 2 fig, 2 tab, 12 ref.

Descriptors: *Avalanches, *Pakistan, *Sediment transport, *Snow, Kaghan Valley, Sediment load.

Debris transport by snow avalanches in the front ranges of the Himalaya in northern Pakistan is described using estimates of sediment concentration in avalanche snow deposits. Data were collected from two end-of-season avalanche deposits in the Kaghan Valley. Sediment concentration estimates and measurements of avalanche deposit volumes were used to produce estimates of total sediment load. From these, deposit area accretion values of 0.74 and 0.21 mm for the two deposits representing the 1986/87 avalanche season were derived. The estimates reported here are within the range of avalanche debris transport and deposition values reported in previous research. (Author's abstract)

Bulletin de la Societe Geologique de France, Vol. 8, No. 4, p 647-656, July 1990. 3 fig, 1 tab, 2 plates.

Descriptors: *Algae, *Climatology, *Lake Tanganyika, *Limnology, *Paleohydrology, *Sedimentology, *Stromatolites, Biological studies, Copper, History, Lake Kivu, Light intensity, Salinity.

Lake Tanganyika stromatolites occur at depths ranging from 6 to 60 m. They mark former low lake levels and document the recent hydroclimatic history of the basin from 3,500 to 1,300 B.P. During this period, conditions more arid than today closed the Tanganyika basin, and the water level dropped to 10 m below the present depth. Stromatolites developed continuous planar encrustations on vertical surfaces, as well as thick encrustacians around blocks and pebbles. Biological competition in benthic microbial communities favored columnar growth; the resulting structures show digitate, dendroid and anastomosed branching styles. Stromatolites occurrence depends on limnological parameters such as salinity, light, Ca concentration, and turbidity, and their growth is partly controlled by sporadic discharges of eutrophic waters from Lake Kivu. Lake Tanganyika stromatolites illustrate the complexity of freshwater stromatolites ecological requirements that explains their relative scarcity in East African rift. (Author's abstract)

ANCIENT CHANNELS OF THE SUSQUEHANNA RIVER BENEATH CHESAPEAKE BAY AND THE DELMARVA PENINSULA.
Geological Survey, Woods Hole, MA.
S. M. Colman, J. P. Halka, C. H. Hobbs, R. B. Mixon, and D. S. Foster.
Geological Society of America Bulletin BUGMAF, Vol. 102, No. 9, p 1268-1279, September 1990. 11 fig, 45 ref.

Descriptors: *Chesapeake Bay, *Delmarva Peninsula, *Glaciation, *Paleohydrology, *River channels, *Sea level, *Sedimentology, *Stratigraphy, *Susquehanna River, Channels, Glaciohydrology.

Three generations of the ancestral Susquehanna River system have been mapped beneath Chesapeake Bay and the southern Delmarva Peninsula. Closely spaced seismic reflection profiles in the bay, and boreholes in the bay and on the southern Delmarva Peninsula allow detailed reconstruction of each paleochannel system. The channel systems were formed during glacial low sea-level stands, and each contains a channel-fill sequence that records the subsequent transgression. The trunk channels of each system are 2 to 4 km wide and are incised 30 to 50 m into underlying strata; they have irregular longitudinal profiles and very low gradients within the Chesapeake Bay area. The three mainstem channels diverge from the head of the bay toward the southeast. The channels are rarely coincident, although they commonly intersect. All three main channels pass beneath the southern Delmarva Peninsula forming an age progression from north (oldest) to south (youngest) beneath the peninsula, and from east (oldest) to west (youngest) beneath Chesapeake Bay. Southward progradation of the tip of the peninsula during interglacial high sea-level stands caused southward migration of the mouth of the bay, so that the next generation of channels were incised progressively further toward the southwest. The youngest paleochannel is clearly of late Wisconsonian age, about 18 ka, and the intermediate one appears to be late Illinoian in age, or about 150 ka. The age of the oldest paleochannel is not well constrained, but it is in the range of about 200 to 400 ka. The three paleochannel systems imply a dynamic coastal-plain environment and at least two previous generations of the Chesapeake Bay. Both the Chesapeake Bay and the Delmarva Peninsula have changed considerably in the past half million years. (Author's abstract)

MONITORING THE EROSION OF AN EXPRESSWAY DURING ITS CONSTRUCTION: PROBLEMS AND LESSONS.
Macquarie Univ., North Ryde (Australia). School of Earth Sciences.
S. J. Riley.
Hydrological Sciences Journal HSJODN, Vol. 35, No. 4, p 365-381, August 1990. 7 fig, 29 ref. NSW Department of Main Roads, funds administered by the Soil Conservation Service of NSW.

Descriptors: *Road construction, *Sediment erosion, *Soil erosion, Accelerated erosion, Australia, Catchment areas, Data acquisition, Drainage patterns, Electronic equipment, Electronic recorders, Monitoring, Sediment discharge, Sediment load, Sediment sampler.

Road construction sites are major sources of sediment and without careful control large quantities of sediment can be moved off-site during erosional events and cause significant economic and environmental damage. The dynamic nature of the catchment materials and drainage network require intensive and repetitive monitoring. The quick response times of the floods present problems of monitoring and gaging. The large quantities of sediment eroded from the F3 Expressway extension in the northern suburbs of Sydney, NSW, Australia, and the lack of defined channels within the catchment presented several problems of discharge and sediment load sampling. The monitoring equipment at the catchment outlet, namely pump samplers and capacitance-based water level sensors, was computer controlled, but for partial area monitoring manual methods were used together with Gerlach traps and erosion pins. The monitoring at the catchment outlet was cost-effective because of the use of electronic equipment. The experience on the F3 Expressway in NSW showed that the frequency of sensor sampling had to be on the order of 30 seconds. The high sediment loads, with coarse sediment concentrations in excess of 100 g/L, demanded frequent maintenance of equipment, particularly the pump samplers, and the need to install backup samplers to reduce the loss of data. In the future, use should be made of radio transmission of data from sensors to data logger to minimize the problems of disturbance. Low level photogrammatic surveys need to be undertaken after each storm event in order to record the detail of erosion and source areas. (Fish-PTT)

DEVELOPMENT, CALIBRATION AND FIELD TESTING OF A SOIL LOSS AND A RUNOFF MODEL DERIVED FROM A SMALL-SCALE PHYSICAL SIMULATION OF THE EROSION ENVIRONMENT ON ARABLE LAND IN ZIMBABWE.
Institute of Agricultural Engineering, Harare (Zimbabwe).
H. A. Elwell.
Journal of Soil Science JSSCAH, Vol. 41, No. 2, p 239-253, June 1990. 11 tab, 18 ref.

Descriptors: *Agriculture, *Data interpretation, *Land loss, *Rainfall-runoff relationships, *Runoff forecasting, *Soil erosion, *Zimbabwe, Arable soils, Calibrations, Cropland, Field tests, Mathematical models, Model studies, Model testing, Rill erosion, Sheet erosion.

Measured soil losses from field plots under natural rainfall are the traditional data source for building farm-oriented prediction models. An exploratory investigation was made into the potential of small-scale physical mimicry in the development of mathematical models which, after calibration, would yield predictions of field-scale runoff and soil losses arising from sheet erosion (interrill) processes. Soil loss and runoff prediction models were developed for a clay soil in Zimbabwe from a five-factor small-scale physical simulation of the field environment by following a central composite rotatable experimental design. The uncalibrated models efficiently ranked observed annual soil losses and runoff over a 4-year period between nine field treatments. Each treatment consisted of two bare fallows, two weed fallows and five plots cropped to soybeans. When calibrated against the field data, the soil loss model predicted the 4-year mean losses from cropped and bare fallow treatments to within 6% for two of the plots, to within 12% for five of the plots, and to within 14% for all seven treatments. Over the same period, the runoff model predicted mean annual runoff for the cropped and bare fallow treatments to within 4% for four of the plots and to within 16% for all seven treatments. Percentage of vegetal cover proved to be an adequate parameter for describing the role of the soybean crop in runoff and soil loss processes for a wide range of planting densities of the crop. However, it did not prove to be an efficient index for weed fallows and it was apparent that factors other than simple above-ground cover became important soon after germination. (Author's abstract)

The concept of unification, the opposite of branching theories used in biological sciences, has been introduced as a new avenue to investigate the behavior of bed features in alluvial channels under unidirectional flow. The approach starts with the theoretical concepts according to which the features propagate at speeds inversely proportional to their heights. This leads to coalescence and rearrangement of the general pattern of bed features. Numerical experiments show that an initial large number of arbitrary bed disturbances rapidly reduces to a small number. If one feature reaches the maximum height for given flow conditions, smaller features pass through it. An initial uniform distribution of heights of disturbances slowly changes into a broad distribution of heights with some at the maximum height, similar to what is observed in nature. (Author's abstract)

MODELING EROSION OF SAND AND SILT BED RIVER.
Barnett Consultants, Hamilton (New Zealand).
H. L. MacMurray, and M. N. R. Jaeggi.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 9, p 1080-1089, September 1990. 6 fig, 11 ref.

Descriptors: *Hydraulic models, *Model studies, *River sediments, *Sediment erosion, *Sediment transport, *Stream erosion, Alluvial plains, Channel erosion, Lake sediments, Sand, Silt, Wash load.

A conventional numerical river model that failed to adequately reproduce the erosion of a 20-km stretch of a sand-bed river, was modified to allow a substantial proportion of the eroded material to be designated as transported in the form of wash load. This reflects the formation of the river plain from proglacial lake sediments, which commonly have a large silt fraction. Because wash load has practically no effect on the transport capacity, except at very high concentrations, less of the transport capacity is devoted to transport of already eroded material, and more to further erosion. By assuming the proportion of silt to be 40%, the observed erosion could be satisfactorily reproduced. The average wash-load concentration that follows from this assumption is quite small. (Author's abstract)

THREE-DIMENSIONAL COMPUTATION OF FLOW AND BED DEFORMATION.
Civil Engineering Research Inst., Sapporo (Japan).
Y. Shimizu, H. Yamaguchi, and T. Itakura.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 9, p 1090-1108, September 1990. 11 fig, 28 ref, append.

Descriptors: *Channel morphology, *Data interpretation, *Flow models, *Model studies, *Numerical analysis, *River beds, *Three-dimensional model, Bed load, Channel flow, Dimensional analysis, Flow equations, Flow velocity, Sediment transport, Suspended load.

Several studies have been made to evaluate flow and bed variation in curved channels. Numerical models are useful in that they can be applied to channels with various plane geometries and boundary conditions. A three-dimensional (3D) flow model was developed to improve the defects of a two-dimensional (2D) model. Calculated results were compared with experiments as well as with results calculated by the 2D model. It was found that the flow field is predicted more closely by the 3D model than the 2D model. A simplification of the full 3D model assumes the depthwise profile of the velocity to be logarithmic. This approach was favorably tested in the calculation of flow in a meandering bend. The simplified 3D model was applied to the computation of bed deformation by bed load as well as suspended load transport in meandering channels. Good agreements were found in comparison with the experimental results. A definite difference between the 3D and 2D models was found in the predicted bed deformation with suspended load. Evaluations of the flow and bed deformation by the proposed model were clearly demonstrated through application examples, and the validity of the new calculation model was verified. CHANGES IN STREAM MORPHOLOGY AND STORM TRANSPORT OF SESTON FOLLOWING WATERSHED DISTURBANCE.
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
S. W. Golladay, J. R. Webster, and E. F. Benfield.
Journal of the North American Benthological Society JNASEC, Vol. 6, No. 1, p 1-11, March 1987. 4 fig, 6 tab, 49 ref. National Science Foundation Grants BSR 8316000 and BSR 8012093.

Descriptors: *Appalachian Mountains, *Channel morphology, *Forest watersheds, *Sediment transport, *Seston, *Storm runoff, *Streams, Flow discharge, Headwaters, North Carolina, Organic matter, Particulate matter, Seasonal variation, Storms.

Headwater streams are closely linked to the areas they drain, thus watershed disturbance can cause severe disruption within streams. Surveys of stream morphology and measurements of particulate organic matter (seston) transport were made in four streams to examine response to forest disturbance. Seston was sampled during baseflows and stormflows in streams draining an 8-year-old clearcut, a 25-year-old clearcut, and two reference watersheds in the southern Appalachian Mountains of North Carolina. The surveys indicated that there were fewer debris dams and organic matter accumulations in disturbed streams. Baseflow seston concentrations varied seasonally (0.5 to 1.0 mg/L in winter and 3.0 to 7.0 mg/L during summer). Baseflow seston concentrations did not differ consistently between streams. In all streams, seston concentration increased with increasing discharge during storms and was positively correlated with the rate of change of discharge during rising flows. Seston concentrations decreased during peak flows and gradually declined as discharge returned to baseflow. Average seston concentrations during storms were generally highest in streams draining disturbed watersheds, and export was significantly higher in streams draining disturbed watersheds. Storm transport varied with season, storm intensity, and storm duration. Baseflow seston concentrations in streams draining disturbed areas may return to normal levels within a few years following disturbance; however, concentrations during storms may remain elevated for many years. NUMERICAL SIMULATION OF GRAVEL RIVER WIDENING.
Delaware Univ., Newark. Dept. of Geology.
J. E. Pizzuto.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 1971-1980, September 1990. 14 fig, 1 tab, 35 ref.

Descriptors: *Alluvial channels, *Bank erosion, *Channel morphology, *Erosion, *Gravel, *Model studies, *River widening, *Stream banks, Bank failure, Flumes, Sediment transport.

A numerical model, which simulates bank erosion in a straight channel composed of noncohesive sediment, predicts the distribution of boundary shear stress, cross-channel sediment transport rates and the evolution of the bed topography. When erosion produces a bank slope which exceeds the angle of repose, widening occurs by a planar bank failure. Equilibrium channels produced by the model have flat beds and curved bank regions which are similar to the classical cosine stable bank profile. Equilibrium values of dimensionless depth are inversely proportional to the slope, as suggested by previous studies. The model also reproduces the exponential cross sections created during laboratory experiments. However, as the computations proceed, the exponential profiles slowly develop a flat bed and a curved bank region, suggesting that past flume experiments of channel widening may have frequently been terminated before a stable equilibrium form had evolved. STATISTICAL CHARACTERISTICS OF SOME ESTIMATORS OF SEDIMENT AND NUTRIENT LOADINGS.
Instituto de Pesquisas Hidraulicas, Porto Alegre (Brazil).
R. T. Clarke.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2229-2233, September 1990. 4 fig, 1 tab, 8 ref.

Descriptors: *Model studies, *Nonpoint pollution sources, *Probability distribution, *Sediment load, *Sediment yield, *Statistical analysis, Estimating, Mathematical models, Sediment discharge.

Some of the statistical characteristics of estimators of sediment load which require the integration over time of the product of a concentration (c) with a discharge (q) were examined. Using a bivariate lognormal distribution for the discrete variables approximate confidence intervals were calculated for an unbiased estimator of sediment yield, and the exact sampling distribution of the estimator was obtained by numerical integration of a Fourier transform. This permits an investigation of the rapidity with which the estimator tends to normality. Provided the data sequences are serially independent, the same technique can be used to obtain the distribution of an estimator without the assumption of bivariate lognormality. Some characteristics of an 'extrapolation' estimate of sediment yield were derived, in which power law regression is used to estimate concentration from discharge when measurements of the latter are more plentiful than the former. Subject to model assumptions, the extrapolation estimate was found to underestimate the true sediment load, although its variance is smaller; this confirms previously published results obtained by empirical sampling and alternative theoretical approaches. DEPRESSIONAL STORAGE FOR MARKOV-GAUSSIAN SURFACES.
National Soil Erosion Lab., West Lafayette, IN.
C.H. Huang, and J. M. Bradford.
Water Resources Research WRERAQ, Vol. 26, No. 9, p 2235-2242, September 1990. 12 fig, 2 tab, 13 ref.

Descriptors: *Depression storage, *Erosion, *Markov process, *Mathematical analysis, *Ponding, *Rainfall-runoff relationships, *Soil erosion, Roughness, Soil physical properties, Storage, Topography.

Processes during rain events, such as infiltration, runoff, soil erosion, and crust formation, are influenced in part by depressional storage and surface roughness. If the surface topography is known, its potential depressional storage can be calculated. A study was conducted to relate the statistical parameters for quantifying surface roughness to depressional storage. Analysis of topographic data sets digitized at millimeter grids by a laser scanner showed that soil roughness can be quantified by a Markov-Gaussian (M-G) type random process. A Monte Carlo simulation procedure was used to find the mean ponding characteristics from simulated M-G surfaces. Depressional storages were found to be functions of two M-G parameters, two sample length scales, and the slope steepness. The Markov parameters are the global variance and the correlation length scale (L), and the sample length scales are grid spacing (delta x) and side length (L sub s). After proper scaling, all storage functions collapsed into two nondimensional relationships: 1) storage at zero slope as a function of relative sample length scale, and (2) storage as a function of scaled slope. When L = O, simulated surfaces followed the random Gaussian model and the nondimensional storage was only a function of scaled slope. Storages calculated from digitized elevation data sets with M-G type statistics agreed well with results obtained from simulated surfaces. (Author's abstract)

STUDY ON GEOCHEMISTRY AND GEOCHEMICAL CLASSIFICATION OF ELEMENTS B, F, RB AND SR IN YELLOW SEA (HUANG HAI) SEDIMENTS.
Academia Sinica, Qingdao (China). Inst. of Oceanology.
T. Wang.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 20, No. 6, p 517-527, November 1989. 6 fig, 5 tab, 13 ref.

Descriptors: *Boron, *Calcium, *Fluorine, *Geochemistry, *Marine sediments, *Rubidium, *Strontium, *Yellow Sea, Clay minerals, Cluster analysis, Marine pollution, Metals, Particle size, Sediment distribution, Spatial distribution, Statistical analysis.

The abundance of the boron, fluorine, rubidenum, and strontium through distribution characteristics, correlative relationships, and other geochemical characteristics were studied. Elemental compositions were correlated to the grain size of the sediment. It was found that concentrations of B, F, and Rb increased with decreasing sediment grain size, while Sr levels decreased. Further, B, F, and Rb were found in greater association with clay minerals. Levels of B and F in heavy minerals were much higher than in lighter minerals. Geochemically, B and Rb were found to have a close relationship with Al, and F with siderophile elements. Concentrations of Sr relate directly to Ca levels, and become further enriched in carbonates. R-cluster analysis showed that the 19 elements analyzed in the Yellow Sea sediments can be divided into two groups: one primarily from terrigenous materials, and the other from authigenic and biogenic accumulation. Q-cluster analysis suggested that these same Yellow Sea sediments be divided into three types: (1) composed of fine and current sediments containing more B, F, Rb and other philo-clay elements. This type of sediment is formed in weakly hydrodynamic and reducing environments; (2) large grain and residual sediments, which enrich Sr and Ca, and form in strongly hydrodynamic and residual sedimentary environments; and (3) large grain and current sediments which have characteristically low levels of Sr, Ca, B, F, Rb, and other elements. This type of sediment is formed mainly in strong hydrodynamic and temporal sedimentary environments. The major controlling factors for the geochemical characteristics of elements found in Yellow Sea sediments are: elemental properties, material sources, sediment types, hydrodynamic conditions, and physicochemical conditions. (Author's abstract)

Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 20, No. 6, p 544-553, November 1989. 10 fig, 2 tab, 3 ref. English summary.

Descriptors: *China, *Sediment distribution, *Sediment transport, *Statistical models, Lianyungang, Mathematical models, Model studies, Spatial distribution, Tidal currents, Wave action, Wave energy, Wave height, Yangshan Island.

The lateral distribution of sediments in waters of the Lianyungang Harbor were modeled using the statistical distribution of wave heights from the wave energy method. The mathematical expression for the region beyond the breaking wave zone was derived by superimposing data describing several lines of sediment dispersal. Sediment concentrations beyond the breaking zone were calculated from the wave energy and the position of the breaking wave zone. This model can calculate the distribution of sediment levels both inside and outside the breaking wave zone. The values calculated from the model match sediment concentrations actually measured offshore. The mixing and suspension of sediments inside the breaking zone and the dispersion of sediments by tidal currents offshore are described. The concentration of sediments inside the breaking zone increased with wave height at Yangshan island. Data correlating wave energy with wave height are also given. (King-PTT)

MICROORGANISMS IN MARINE SEDIMENTS: CONSIDERATIONS CONCERNING ACTIVITY MEASUREMENTS.
Kiel Univ. (Germany, F.R.). Inst. fuer Meereskunde.
L.-A. Meyer-Reil.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 1-6, 1990. 3 fig, 9 ref.

Descriptors: *Analytical methods, *Marine bacteria, *Marine ecology, *Marine sediments, *Microbiological studies, *Microorganisms, Bacterial analysis, Benthic environment, Enzymes, Sediment analysis, Sediments.

The measurement of microbial metabolic activity in marine sediments suffers from an insufficient knowledge of benthic microbial life and from an uncritical application of analytical methods to the sediment environment. Disturbance of the sediments causes a considerable stimulation of microbial metabolism. In sediments with high adsorption capacities and/or low microbial activity, extrapolated metabolic rates may vary considerably, depending on the choice of controls to account for the non-biological activity. Although of fundamental importance for the evaluation of the oxidation of organic substrates in sediments, the measurement of extracellular enzymatic activity still suffers from a number of drawbacks. Hydrolysis rates depend on the nature and the concentration of model substrates used to measure activity. New approaches based upon a critical application of methods, and taking into account the basic characteristics of benthic microbial life, are needed to study microbial metabolism in sediments. (MacKeen-PTT)

MEASUREMENT OF CO2-FIXATION IN SEDIMENTS: SOME THEORETICAL AND TECHNICAL ASPECTS.
Kiel Univ. (Germany, F.R.). Inst. fuer Meereskunde.
W. Reichardt.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 7-16, 1990. 9 fig, 2 tab, 15 ref.

Descriptors: *Analytical techniques, *Benthic environment, *Carbon dioxide, *Diagenesis, *Sediment analysis, *Sediment chemistry, *Sediments, Carbon dioxide fixation, Energy transfer, Marine sediments, Microbiological studies, Microorganisms.

To assess the contribution of dark fixation of carbon dioxide to benthic energy flow, rate measurements have to be specified in terms of 'autotrophic primary biosynthesis'. Determination of rates of aerobic chemoautotrophic carbon dioxide fixation in marine sediments was attempted with iodoacetamide as an inhibitor of ribulose 1,5-biophosphate carboxylase dependent pathways. Techniques established for phytoplankton primary productivity studies became very complicated when applied to sediments. In acidified sediment samples, the larger fraction of assimilated carbon was found in the dissolved, acid-soluble pool. To avoid artificial stimulation of carbon dioxide incorporation, core injection of small volumes of the substrate solution is recommended; however, control of its distribution during minimal incubation periods is desirable. MEASUREMENT OF EXOENZYMATIC ACTIVITY IN STREAMBED SEDIMENTS USING METHYLUMBELLIFERYL-SUBSTRATES.
Max-Planck-Inst. fuer Limnologie, Schlitz (Germany, F.R.). Limnologische Flussstation.
J. Marxsen, and K.-P. Witzel.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 21-28, 1990. 4 fig, 1 tab, 17 ref.

Descriptors: *Analytical techniques, *Biodegradation, *Enzymes, *Microbial degradation, *Sediment chemistry, *Sediments, *Streams, *Substrates, Beta-D-glucosidase, Enzyme activity, Europe, Extracellular metabolism, Sediment analysis, Streambed sediments.

The microbial degradation of macromolecular organic compounds in aquatic environments involves a combination of processes, including extracellular enzymatic hydrolysis, the uptake of monomeric and oligomeric molecules into cells, and respiration. Methodological investigations of extracellular enzymatic hydrolysis were undertaken in differing stream habitats. 4-Methylumbelliferyl substrates

LIBRARY U. OF I. URBANA-CHAMPAIGN

were used to measure the activity of extracellular beta-D-glucosidase and phosphatase in small central European streams. The substrates could be used for stream water, sandy sediments, and coarser artificial substrata. Although beta-D-glucosidase activity per unit surface area was about ten times higher in coarse particulate sediments than in sandy sediments, maximum activity per unit volume was observed in sandy sediments. This means that for the streams as a whole, the greater proportion of the exoenzymatic cleavage activity occurs in the sandy streambed deposits. (MacKeen-PTT)

METHOD OF MEASURING THE DEHYDROGENASE ACTIVITY OF SEDIMENTS.
Sofia Univ. (Bulgaria). Dept. of Ecology.
B. B. Boyanovsky.
Ergebnisse der Limnologie ERLIA6, Vol. 34, p 29-31, 1990. 1 fig, 1 ref.

Descriptors: *Dehydrogenase activity, *Enzymes, *Microbiological studies, *Microorganisms, *Sediment chemistry, *Sediments, *Water chemistry, Anoxic conditions, Bacterial physiology, Benthic environment, Bottom sediments, Eutrophic lakes, Lake sediments, Sediment analysis.

A new modification of the dehydrogenase activity (DHA) test, using 2,3,5-triphenyl tetrazolium chloride (TTC) for the estimation of benthic microbial community metabolism in oxic and anoxic sediment is described. Suggestions for use include: a preliminary quantification of interstitial water in sediment samples in order to obtain a definite concentration of TTC and other chemicals; a one-hour incubation time; strict maintenance of anoxic conditions (even in primary oxic sediment samples); use of blanks, treated like other samples, but poisoned with formaldehyde; and measurement of TT-formazan extract absorbance at 520 nm instead of 485 nm. In a moderately eutrophic lake at the depth of 3 m, a 63% higher DHA was measured in the surface oxic sediment layer than in the anoxic layer 20 cm deep. Such activities are higher than in some activated sludges and approximately 10 times higher than in 1 cu m of the most-active river periphyton studied. Further examination of the effect of redox potentials is necessary and the results should eventually be related to the biomass and compared to other activity tests, especially in oxygen uptake. NONLINEAR SOLUTION OF AGGRADATION AND DEGRADATION IN CHANNELS.
Detroit Water and Sewerage Dept., MI.
M. A. Gill.
Journal of Hydraulic Research JHYRAF, Vol. 25, No. 5, p 537-547, 1987. 4 fig, 8 ref.

Descriptors: *Aggradation, *Alluvial channels, *Degradation, *Mathematical analysis, *Sedimentation, Mathematical studies, River mechanics, Sediment supply, Sediment transport, Streamflow.

Channel aggradation and degradation are important in river control engineering. Aggradation occurs in an alluvial river when the imposed sediment supply exceeds the sediment transport capacity of the flow. The flow tends to degrade the river channel when its sediment transport capacity exceeds the sediment supply rate. A perturbation solution was presented for the non-linear aggradation/degradation problem. The first order solution was the linear solution published previously. The second order solution was believed to account for the non-linear character of the aggradation/degradation equation. A non-linear correction was needed when the ratio of the initial and final sediment supply rates was very small. For the degradation problem, non-linear correction was needed in most cases. STANDING-WATER DEPOSITS AS INDICATORS OF LATE QUATERNARY DUNE MIGRATION IN THE NORTHWESTERN NEGEV, ISRAEL.
Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Isotope Research.
M. Magartiz, and Y. Enzel.
Climatic Change CLCHDX, Vol. 16, No. 3, p 307-318, June 1990. 5 fig, 1 tab, 27 ref.

Descriptors: *Dunes, *Geomorphology, *Negev Region, *Paleohydrology, *Playas, *Soil water, *Standing waters, *Surface-groundwater relations, Drainage systems, Glaciation, History, Israel.

Late Quaternary playa (Stand-water) deposits are present in river channels upstream from dune fields in the northwest Negev, Israel, and represent a drainage disordering caused by dune migration during periods of aridity. These deposits are associated with modifications in the drainage system, including course changes and piracy, caused by dunes blocking drainage networks. Radiocarbon dates from the standing water sediments indicate the occurrence of two periods of aridity: (1) 20,900 to 16,000 years B.P.; and (2) 11,680 to 10,300 years B.P. These two periods indicate a correlation between glacial advances in Europe and dry intervals in the Near East during the Upper Pleistocene. The authors suggest that spatial and temporal associations between standing water deposits, modifications in stream direction, soil formation and the dunes themselves can serve as a good indicator for the timing of dune migration. HILLSLOPE EROSION AT THE MAXEY FLATS RADIOACTIVE WASTE DISPOSAL SITE, NORTHEASTERN KENTUCKY.
Geological Survey, Louisville, KY. Water Resources Div.
W. P. Carey, M. A. Lyverse, and C. R. Hupp.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigation Report 89-4199, 1990. 37p, 11 fig, 11 tab, 20 ref.

Descriptors: *Erosion rates, *Geomorphology, *Kentucky, *Mass wasting, *Radioactive waste disposal, Dendrochronology.

Maxey Flats, a disposal site for low level radioactive waste, is on a plateau that rises 300 to 400 ft above the surrounding valleys in northeastern Kentucky. Hillslope gradients average 30% to 40% on three sides of the plateau. The shortest distance from a hillslope to a burial trench is 140 ft on the west side of the site. Rates of hillslope retreat were determined through a combination of direct erosion measurements during the 2-year study and through dendrogeomorphic techniques. Because the dendrogeomorphic rates are average rates during the last 90 years, they were used to estimate the amount of time required for the hillslopes to retreat into the trenches. Rates of hillslope retreat determined from dendrogeomorphic evidence range from 3.8 to 9.1 in/century, so that time to exposure of the trenches ranges from 35,000 to 65,000 years. The minimum estimate of 35,000 years is for the most actively eroding southern slope. Throughout tens of thousands of years, the rate of hillslope retreat is determined more by the occurrence of infrequent extreme events such as slope failure than by the continuous processes of slope wash observed in this study. These slope failures cause as much erosion in one event as hundreds or even thousands of years of slope wash. Periods of tens of thousands of years are also sufficiently long for significant changes in climate and tectonic activity to occur. Rates of erosion observed during this 2-year study are highly unlikely to be indicative of rates averaged over periods of tens of thousands of years during which many extreme events can occur. Thus, the long-term geomorphic stability of the Maxey Flats disposal site will be highly dependent upon the magnitude and frequency of extreme erosive events and upon trends in climate change and tectonic activity. SEDIMENT TRANSPORT AND ACCRETION AND THE HYDROLOGIC ENVIRONMENT OF GROVE CREEK NEAR KENANSVILLE, NORTH CAROLINA.
Geological Survey, Raleigh, NC. Water Resources Div.
T. C. Stamey.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4086, 1989. 30p, 10 fig, 6 tab, 12 ref.

Descriptors: *Grove Creek, *Hydrologic data, *North Carolina, *Sedimentation, Channel improvement, Coastal plains, Drainage, Wetlands.

The Grove Creek basin includes an area of about 42 sq mi in Duplin County, southeastern North Carolina. This report evaluates sediment transport and accretion rates in the lowermost 9-mile reach of Grove Creek using hydrologic, dendrologic, and radioisotopic data collected at seven sites along the study reach. The sediment that is transported in Grove Creek is predominately silt and clay. Suspended-sediment concentrations at discharges less than 100 cu ft/sec are less than 15 mg/L; concentrations at higher discharges did not exceed 67 mg/L. Calculated suspended-sediment loads ranged from 75 to 444 ton/yr at the various data collection sites on Grove Creek. Sediment-accretion rates estimated from dendrologic data ranged from 0.03 to 0.06 ft/yr. The highest accretion rates occur in the downstream swampy reaches and are due to channel braiding, low gradients and flow velocities, and large percentages of overbank flow, which result in the deposition of

clay and silt over wide areas of the flood plain. Sediment-accretion rates along Grove Creek were also estimated by cesium-137 and lead-210 radioisotopic analyses. Sediment cores from the flood plain analyzed for cesium-137 indicate a maximum accretion rate of about 0.024 ft/yr for the period 1952-87. Lead-210 analysis from these same sediment cores indicates an average accretion rate of 0.026 ft/yr to a depth of about 2 ft. The maximum age of the flood-plain sediment at the 2-ft level is about 80 years. (USGS)

SEDIMENT-SOURCE DATA FOR FOUR BASINS TRIBUTARY TO LAKE TAHOE, CALIFORNIA AND NEVADA, AUGUST 1983-JUNE 1988.
Geological Survey, Sacramento, CA. Water Resources Div.
B. R. Hill, J. R. Hill, and K. M. Nolan.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 89-618, 1990. 42p, 8 fig, 30 tab, 17 ref.

Descriptors: *California, *Erosion, *Lake Tahoe, *Lake Tahoe Basin, *Nevada, *Sediment load, *Sediment transport, *Suspended sediments, Sediment discharge, Slope erosion, Stream banks, Stream-channel inventories.

Data were collected during a 5-year study of sediment sources in four drainage basins tributary to Lake Tahoe, California-Nevada. The study areas include the Blackwood Creek, General Creek, Edgewood Creek, and Logan House Creek basins. Data include changes in bank and bed positions at channel cross sections; results of stream-channel inventories; analyses of bank and bed material samples; tabulations of bed-material pebble counts; measured rates of hillslope erosion; dimensions of gullies; suspended-sediment data collected during synoptic snowmelt sampling; and physiographic data for the four study basins. SOLUTION-COLLAPSE DEPRESSIONS AND SUSPENSATES IN THE LIMNOCRENIC LAKE OF BANYOLES (NE SPAIN).
Barcelona Univ. (Spain).
M. Canals, H. Got, R. Julia, and J. Serra.
Earth Surface Processes and Landforms ESPLDB, Vol. 15, No. 3, p 243-254, May 1990. 6 fig, 3 tab, 19 ref.

Descriptors: *Banyoles Lake, *Geomorphology, Karst, *Lake morphology, *Limnology, *Seismology, *Spain, Geology, Sediments, Seismic properties, Stratification.

A high resolution seismic reflection survey in the Banyoles limnocrenic solution lake allowed penetration of dense suspensates occupying cone-like bottom depressions of different sizes. The depressions result from the dissolution and collapse of underlying Eocene calcareous and gypsiferous materials over which lacustrine sediments of varying thicknesses have accumulated. The suspensates occupying the depressions present three main types of seismic signatures: stratified, semistratified, and transparent. The densities of the suspensates and the water depths of their tops, which fluctuate continuously, vary from one depression to another. The maximum seismically recorded suspensate thickness is 44 meters. Morphological and structural features, seismic characters, and variable degrees of hydraulic activity, point to the existence of different stages of maturity in the lake bottom depressions. Recent instability of the lake bottom and subbottom is apparent in the seismic records, indicating that depression formation processes may continue in a short geological time scale. (Stoehr-PTT)

RATES AND MECHANISMS OF DISCONTINUOUS GULLY EROSION IN A RED-BROWN EARTH CATCHMENT, NEW SOUTH WALES, AUSTRALIA.
Soil Conservation Service, Gunnedah (Australia).
R. J. Crouch.
Earth Surface Processes and Landforms ESPLDB, Vol. 15, No. 3, p 277-282, May 1990. 5 fig, 2 tab, 3 ref.

Descriptors: *Australia, *Gully erosion, *Sediment discharge, *Sediment yield, *Soil erosion, Drainage systems, New South Wales, Rainfall, Runoff.

Rainfall, runoff, sediment discharge, and gully expansion were measured for five years in a small catchment in central New South Wales. Sixty percent of the sediment produced from this catchment originated from gully erosion. Gully head erosion was episodic depending on pipe development, cracking, and soil detachment during small runoff events which prepared the heads for rapid soil movement from infrequent large runoff events. On the average each year 5.5 tons of soil were released from the gully heads, 2.5 tons were deposited in the drainage line, and 6.4 tons passed over the weir. In some years very little erosion occurred, in others a large quantity of soil was moved. In this environment erosion from both sources occurred during the same runoff events, particularly after there had been a considerable period of soil detachment with little or no runoff to cause soil movement. In other words, most soil movement occurred in the early stages of some very large runoff events. Soil was detached, both in the gullies and on the ground surface by a variety of mechanisms (soil shrinkage, stock trampling, short duration or low intensity rain) and was then flushed into and along the drainage by large runoff events. (Stoehr-PTT)

Descriptors: *Erosion, *Flumes, *Loam, *Rainfall, *Rill erosion, *Runoff, *Runoff rates, *Soil compaction, *Soil erosion, Experimental data, Geomorphology, Infiltration, Sediments, Silt, Soil moisture retention.

Experiments were carried out in a 20 meter long flume to assess the variation of the runoff erosion resistance of a loamy soil as a function of initial moisture content and compaction. The results of seven experimental runs show that the runoff erosion resistance of a loamy soil is extremely sensitive to variations in initial moisture content and, to a somewhat lesser extent, in bulk density. The very low resistance to runoff erosion of initially dry material is explained by structural changes which take place at the time of wetting. Slaking and microfissuration cause a considerable decrease of the soil's shear strength and therefore of its resistance to runoff erosion. A first analysis shows that, during a given rainfall event, initially dry soils may well show significantly more erosion than initially wet soils, despite the increase of infiltration with decreasing initial moisture content. D. L. Dunkerley.
Earth Surface Processes and Landforms ESPLDB, Vol. 15, No. 5, p 405-412, August 1990. 3 fig, 1 tab, 17 ref.

Descriptors: *Armoring, *Bed load, *Channel armoring, *Gravel, *Particle size, *River beds, *Sediment transport, *Sediments, *Streambeds, Australia, Deposition, Flow characteristics, Scour, Sediment load, Tambo River, Victoria.

Present understanding of armor formation and the dynamics of grain entrainment and movement, especially in natural environments with coarse and poorly-sorted bed material, is still incomplete. There are many details which require further field observation for clarification and hypothesis testing, including aspects of grain interaction during bedload transport. Evidence from the Tambo River suggests that there may be mechanisms of armour development which have significance in certain field situations but which have been relatively neglected in the literature. The particular mechanism envisaged for the Tambo River involves the accumulation on the bed surface of large clasts which had been moving as an overpassing traction carpet. These clasts are not genetically related to the underlying subarmor sediments, but nonetheless act as an armor which protects them from scour, and which hence affects grain mobility and bedload transport rates. (Author's abstract)
W91-01880

BLANKET PEAT EROSION IN A MID-WALES CATCHMENT DURING TWO DROUGHT YEARS.
University Coll. of Wales, Aberystwyth. Dept. of Geography.
I. S. Francis.
Earth Surface Processes and Landforms ESPLDB, Vol. 15, No. 5, p 445-456, August 1990. 4 fig, 2 tab, 39 ref.

Descriptors: *Catchment basins, *Drought, *Erosion, *Peat soils, *Sediment yield, *Soil erosion, *Suspended sediments, Organic soils, Runoff, Sediment discharge, Sediment sampling, Stream discharge, Wales.

The rate of blanket peat erosion was measured at an upland site in central Wales during the 1983-1984 drought years. Erosion pins, a peat surface sediment trap, and sediment sampling in the effluent stream, were used to estimate the rate of peat surface recession and the rate of organic sediment loss from the catchment. An overall rate of surface recession of 16 mm per year on exposed peat faces was recorded with the greatest recession on southwest faces. Eroding peat surfaces exhibited maxi-

LIBRARY U. S. GEOLOGICAL SURVEY

mum recession during the summer, but the peat surface sediment trap indicated that the highest rates of sediment loss from peat faces due to rain wash occurred during the autumn and early winter. Stream sediment sampling showed that the yield of organic sediment from the catchment was 34.4 sq km/yr, with greatest losses also during the autumn and early winter. The evidence suggested that the surface recession, as measured on erosion pins, included a shrinkage component, which might have accounted for as must as 80% of the apparent loss. Direct and circumstantial evidence suggested that peat wastage during the summer months was the most important agent of surface recession in the study period. Desiccation provided available sediment during the autumn, but organic sediment supply became limited as the winter progressed, despite the occurrence of frost heave. (Author's abstract)

INFLUENCE OF DEBRIS FLOWS ON CHANNELS AND VALLEY FLOORS IN THE OREGON COAST RANGE, U.S.A.
Washington Univ., Seattle. Dept. of Geological Sciences.
L. Benda.
Earth Surface Processes and Landforms ESPLDB, Vol. 15, No. 5, p 457-466, August 1990. 6 fig, 22 ref.

Descriptors: *Aggradation, *Channel flow, *Channel morphology, *Debris flow, *Detritus, *Erosion, *Geomorphology, *Oregon, *Sediment erosion, Aggrading rivers, Alluvial channels, Alluvial plains, Bedrock, Channels, Flow characteristics, Gravel, Mountain streams, Sediments.

Debris flows are one of the most important processes which influence the morphology of channels and valley floors in the Oregon Coast Range. Debris flows that initiate in bedrock hollows at heads of first-order basins erode the long accumulated sediment and organic debris from the floors of headwater, first-order and second-order channels. This material is deposited on valley floors in the form of fans, levees, and terraces. In channels, deposits of debris flows control the distribution of boulders. The stochastic nature of sediment supply to alluvial channels by debris flows promotes cycling between channel aggradation which results in a gravel-bed morphology, and channel degradation which results in a mixed bedrock and boulder-bed morphology. Temporal and spatial variability of channel-bed morphology is expected in other landscapes where debris flows are an important process. (Author's abstract)

HYDROGRAPHIC SURVEYS AND SEDIMENTATION IN DEEP BAY, HONG KONG.
Hong Kong Polytechnic, Kowloon. Dept. of Civil and Structural Engineering.
S. H. Wong, and Y. S. Li.
Environmental Geology and Water Sciences EGWSEI, Vol. 15, No. 2, p 111-118, March/April 1990. 5 fig, 2 tab, 5 ref.

Descriptors: *Bays, *Hong Kong, *Hydrography, *Sediment distribution, *Sedimentation, *Sedimentation rates, *Surveys, *Suspended solids, Flocculation, Mathematical models, Particle size, Pearl Estuary, Sediment transport, Tides.

Three hydrographic surveys were carried out in Deep Bay, which is located in the eastern part of Pearl estuary between Shenzhen and Hong Kong. Data on current, size distributions of bottom sediment, suspended solids, and some water quality parameters were obtained. This information is of value for mathematical modeling of tidal circulation and sediment transport in the bay, and also useful in the planning of further development in this area. The sedimentation rate in Deep Bay was estimated by two different approaches, comparison of historical navigation maps and Pb210 dating. Information obtained from the maps indicated that the average sedimentation rate between 1898 and 1949 was about 8 mm/yr, while recent years showed a 15 mm/yr sedimentation rate. The average suspended solids concentrations were 10 mg/L in the wet season survey and 50 mg/L in the dry season survey. There was no significant difference in the size distribution of suspended solids in the vertical direction. The particle size distribution of bottom sediment (composed mostly of silt and clay) was uneven, which is a result of the tidal movement in the estuary. Flocculation is thought to play an important role in sedimentation in Deep Bay. (Stoehr-PTT)

MUD BALANCE FOR BELGIAN-DUTCH COASTAL WATERS BETWEEN 1969 AND 1986.
Rijkswaterstaat, Rijswijk (Netherlands). North Sea Directorate.
J. S. L. J. Van Alphen.
Netherlands Journal of Sea Research NJSRBA, Vol. 25, No. 1/2, p 19-30, May 1990. 7 fig, 1 tab.

Descriptors: *Belgium, *Coastal waters, *Mud, *Sediment transport, *The Netherlands, Erosion, Mud-water interfaces, Sedimentation, Suspended solids.

Mud transport and mud-balances are usually calculated from multipication of suspended matter concentrations and depth-averaged residual water transport. The results are assumed to underestimate the actual mud transport because the suspended matter concentrations are measured at sea surface, mostly during calm weather. In addition, these kinds of budgets are sensitive to small variations in the estimated residual current velocity. These problems can be overcome by comparing the calculated transports with the fluxes that result from balancing amounts of erosion and deposition. The last figures integrate spatial differences in transport over time to a large extent. Following this approach it is shown that between 1969 and 1986 variations in the mud budget occurred as a result of large-scale human interference (deepening the approach channel to Zeebrugge, closure of Dutch Delta estuaries). The variations were small compared with the annual longshore mud transport, which is dominated by the amount of mud that passes from Dover Strait to Belgian-Dutch waters (c. 8.5 times 10 to the 6th power per year), but were relatively large when compared with the mud transport in the 20 km wide coastal zone. The fluctuations in the annual frequency and duration of gales can cause the annual flux of mud to double in some years. (Author's abstract)
W91-01934

SUPPLY AND DEPOSITION OF SEDIMENT ALONG THE NORTH BANK OF HANGZHOU BAY, CHINA.
East China Normal Univ., Shanghai. Inst. of Estuarine and Coastal Research.
B. C. Wang, and D. Eisma.
Netherlands Journal of Sea Research NJSRBA, Vol. 25, No. 3, p 377-390, June 1990. 14 fig, 4 tab, 11 ref.

Descriptors: *China, *Hangzhou Bay, *Sediment distribution, *Sediment transport, *Sedimentation, Tidal currents, Tidal flats, Tidal range, Wave direction, Wave height.

Sediment transport and deposition processes were studied on the tidal flats along north Hangzhou Bay (P.R. China) because of the large tidal range, abundant sediment supply and strong seasonal variations. Tidal currents reach a maximum of 8.9 meters per second. The flood is stronger but of shorter duration than the ebb. Waves come from S-SE during the summer (wet season) and from NE-NW during the winter (dry season). Average waves are 40 cm high, but may reach 4 m during storms. Sediment is largely supplied from the Chang Jiang, small amounts also from the Qiantang Jiang. Sediment supply is largest during the winter. The tidal flats consist of clay, silt and some fine sand; they are 0.6 to 2km wide. Deposition on the high parts of the flats is enhanced by tidal asymmetry while up-slope transport of sediment is increased by a turbulent front that develops during the flood. Erosion on the flats takes place mainly during summer storms (typhoons), when wave-cut puddles and scarps are formed. In the upper part, vegetation reduces the effect of storms and mainly laminated sediment is present. (Author's abstract)

Mercury concentrations and speciation were determined in surface water samples from lakes and rivers in California and other areas. The freshwater systems studied ranged from a pristine alpine lake to a system with Hg-contaminated sediments. Total Hg levels spanned between 2.4 to 500 pM, while dissolved Hg levels ranged from 2 to 60 pM. Dissolved organo-Hg compounds accounted for a majority (up to 89%) of the dissolved Hg in some lakes. Interestingly, those lakes in which highly dissolved organo-Hg levels were observed also had high levels of Hg in fish tissues. A significant portion of the total Hg was usually in the particulate fraction, indicating that suspended particles can be important in influencing Hg cycling in lakes. The total Hg levels obtained, using clean sampling and analytical technologies, were considerably lower than most historical reports. (Author's abstract)

Descriptors: *Colorado, *Diurnal variation, *Drainage, *Flow discharge, *Snowmelt, *Solutes, *Water chemistry, Solute transport, Water quality.

The results of short-interval sampling of water quality over seven diurnal flow cycles from the Martinelli Basin, site of a long-lasting snowpatch in the Colorado Front Range show an inverse relationship between discharge and the concentration of most solute species. This relationship reflects varying proportions of melt water transferred to the channel through different routes, and suggests that variations in water quality over the diurnal cycle might be used to partition the flow hydrograph. Bias exists in mass yield estimates that are based upon water samples taken with a daily (or longer) interval at the same point in the flow cycle. On the Martinelli site, this bias is less than 5% for most solutes, but is much greater than that in the case of chloride, silicon, and suspended sediments. (Author's abstract)

Atmospheric Environment ATENBP, Vol. 24A, No. 8, p 2247-2251, August 1990. 2 fig, 1 tab, 18 ref.

Descriptors: *Acid rain, *Chemical analysis, *Chemistry of precipitation, *Cloud liquid water, *Hail, *Path of pollutants, Chlorides, Chromatography, Convective precipitation, Nitrates, Nitrites, Oxalates, Sulfates.

This is a preliminary exploration of using hailstones as natural probes of cloud droplet chemistry. Big hailstones grow primarily in the strongest updraft regions of the most severe convective storms, so that if their chemical contents are representative of the cloud droplets from which they grow, they could be useful probes of chemical transport from the lower troposphere to the tropopause, where the anvils form and then evaporate. Results from chromatographic analysis of chloride, nitrate, nitrite, sulfate and oxalate are presented from individual growth layers of hailstones collected from several different storms. In spite of considerable variability, and the possibility of contamination from the ground, the results appear consistent enough to warrant further investigation of this possible source of data on cloud chemistry. Contamination of hailstone layers, especially on the ground, remains a problem. If this method is to be applied, the hailstones should be caught in nets, and experiments should be done with a hail tunnel to determine the extent of fractionation involved in layer formation, as a function of growth conditions. When hail growth is so wet that it is accompanied by shedding, for instance, then the ice is expected to be purer than cloud water. However, the character of the layers can be used to eliminate those most likely to be misleading. (Lantz-PTT)

DISSOLVED ORGANIC CARBON CONCENTRATIONS AND FLUXES ALONG THE MOISIE RIVER, QUEBEC.
University Coll. of North Wales, Bangor. School of Animal Biology.
T. E. Ford, S. A. Ford, M. A. Lock, and R. J. Naiman.
Freshwater Biology FWBLAB, Vol. 24, No. 1, p 35-42, August 1990. 2 fig, 2 tab, 25 ref.

Descriptors: *Canada, *Dissolved organic carbon, *Moisie River, *Quebec, *Rivers, *Water chemistry, Abiotic factors, Biotic factors, Conductivity, Hydrogen ion concentration, Optical density, Temperature.

The main stream and tributaries of a 145 km reach of the Moisie River, Quebec, were examined for temperature, conductivity, pH, dissolved organic carbon (DOC), %DOC $>$100,000 nominal molecular weight (NMW), optical density (OD350), and the ratio of OD400 to OD600 (E4:E6). Dissolved organic carbon concentrations correlated closely with OD350 ($r^2=0.92$, $P<0.001$). However, %DOC $>$100,000 NMW did not correlate with the E4:E6 ratio. Except for a slight increase in %DOC $>$100,000 NMW ($r^2=0.37$, $P<0.05$) no change in any characteristic occurred down the length of the Moisie River, despite consistently higher levels of DOC in the tributaries. The results suggest that high concentrations of DOC in tributary waters are rapidly removed within the main river channel. There are a number of mechanisms by which the main channel of a large river can

influence its dissolved organic matter load. Removal pathways may be biotic (e.g. mineralization by heterotrophic microorganisms) or abiotic (adsorption, precipitation, chemical oxidation or complexation). Only low levels of heterotrophic activity have been measured in boreal rivers relative to temperate rivers with lower DOC, and DOC that has reached the Moisie River might be expected to be microbially recalcitrant. Biotic activity may be responsible for regulating composition of DOC whereas abiotic processes are likely to predominate in regulation of DOC concentration and flux. (White-Reimer-PTT)

Descriptors: *Biofilms, *Dissolved organic matter, *Metabolism, *Molecular weight, *Rivers, England, Enzymes, Germany, Inhibitory effects, Phenols.

The effect of removal of organic matter >1000 apparent molecular weight (AMW) on biofilm processes was determined in three contrasting streams in West Germany and three contrasting rivers in the U.K. This process removed 66-85% of the dissolved organic matter supply. Elevations in extracellular enzyme activity (beta-glucosidase, phosphatase and esterase), metabolic heat-output, bacterial density and poly-beta-hydroxy alkanoate (PHA) content (a prokaryote storage product) were noted throughout the study in response to the removal of organic matter. This suggests that there are inhibitory substances present in the dissolved organic matter pool >1000 AMW. It is probable that phenolics play a role in this inhibition. Decreases in metabolic heat output, beta-glucosidase activity and PHA content were noted at four sites in response to the removal of >1000 AMW material. The divergent responses of the six river/stream biofilms are indicative of radically differing metabolic/catabolic processes, on a spatial and/or temporal basis, to a major organic supply perturbation. Descriptors: *Aluminum, *Chemical reactions, *Hydrogen peroxide, *Iron, *Oxidation, *Phenols, *Wastewater treatment, *Water treatment, Alumina, Aqueous solutions, Catalysts, Chemical interactions, Copper, Spectroscopy, Water chemistry.

In order to specify its reaction mechanism, the oxidation by hydrogen peroxide of phenols in an aqueous medium in the presence of various heterogeneous catalysts and in particular alumina supported iron was studied. The Fenton reactant (H_2O_2 + Fe(2+)) on phenols and on organic acids was used to compare this system to the catalytic oxidation on a solid catalyst (iron/alumina, iron-copper/alumina) by hydrogen peroxide. The structure of the supported metal was determined by Mossbauer Spectroscopy which established on the one hand the relationships between the structure and the mode of preparation of the catalyst and on the other the modifications of the catalyst surfaces after an oxidation reaction of organic compounds in an aqueous medium. The results showed that the catalytic oxidation of phenol is very weak. In contrast to phenol, polyhydroxybenzenes are readily degraded in heterogeneous catalysis by hydrogen peroxide. The reaction rate is a function on the one hand of the catalytic properties and on the other of the reaction conditions (pH, temperature, presence of bicarbonates in the solution). In general, the reaction rate in heterogeneous catalysis always seems to be a function of the degree of hydroxylation of the organic compounds in contact with the catalyst in the presence of H_2O_2. Two types of oxidation mechanisms in heterogeneous catalysis can be envisaged: radical mechanism--the radicals formed by the decomposition of H_2O_2 on the active sites of the catalyst react with the organic compounds; and non-radical mechanism. Descriptors: *Analytical techniques, *Sediment analysis, *Sediment chemistry, *Separation techniques, *Trace elements, *Water analysis, *Water chemistry, Chemical properties, Data interpretation, Extraction procedures, Kinetics, Physical properties, Sediments.

Sequential extraction procedures consist of subjecting a given sediment sample to a series of increasingly strong reagents under specified conditions. An increasing number of researchers are using sequential extractions to determine the speciation of trace elements in sediments. Unfortunately, sequential extraction methods have not been successfully validated. The results are simply taken as providing operational definitions of the phases one is trying to measure. Sequential extraction procedures do not provide actual particulate speciation. Moreover, the physicochemical conditions used during extraction procedures (strong reagents and fast kinetics) cannot be extrapolated to naturally occurring processes (weak reagents, slow kinetics). Sequential extraction procedures have demonstrated only one incontrovertible distinction among fractions: the residual fraction of trace elements remains unaffected by short-term natural, anthropogenic, or experimental changes in the total element concentrations. It is suggested that it is necessary to elucidate particulate material speciation since it governs geochemical fate and bioavailability of trace elements. However, when a recipe for an extraction procedure is indiscriminately applied to a sediment sample, it is very unlikely that the results have scientific meaning or usefulness. The development and validation of an appropriate analytical method to determine the speciation of trace elements in a sediment sample must precede its application. The necessity that many environmental chemists and geochemists feel to characterize the speciation of trace elements in sediments does not justify using an unvalidated technique or hiding behind operational definitions that have no chemical meaning. ion concentration, Igneous rocks, Magnesium, Peat soils, Water chemistry.

The interaction of acid deposition with soils has been the subject of considerable interest in the past decade. However, there have been no systematic comparisons of soil water chemistry on different parent materials within catchments. Soil solution chemical composition was monitored over a 2-year period at three plots near the edge of an igneous intrusion in southwest Scotland. Soil solutions were all strongly acidic with a mean pH of approximately 4.0 at 0.20 m depth, and 4.5 at 0.60 m. Chemical composition of the deeper soil solutions varied with geology. Greatest acidity and aluminum concentrations were found over metamorphosed Ordovician sedimentary rocks, with mean pH of 4.3 and Al concentration of 22 mmol/cu m at 0.60 m. At a site on similar rocks nearer the intrusion, mean pH at 0.60 m was 4.8, with very low Al (3 mmol/cu m) and correspondingly greater Ca. At a peaty site on igneous rocks, increased pH with depth was associated with no change in base cations and Al but a reduction in mean SO4 from 41 mmol/cu m at 0.20 m to 10 mmol/cu m at 0.60 m. Ion-exchange selectivity coefficients calculated from soil and solution chemistry differed slightly from currently used values for peaty upland soils, with larger coefficients for Al/K exchange and smaller coefficients for Al/Ca and Al/Mg exchange. Relations between Al and H ion concentrations confirmed under-saturation of solutions with respect to gibbsite at 0.20 m. The differences between plots were consistent in different seasons, despite significant seasonal variability in Na, Cl, dissolved organic carbon and Fe. (Author's abstract)

Water Resources Research WRERAQ, Vol. 26, No. 9, p 1981-2014, September 1990. 19 fig, 12 tab, 89 ref.

Descriptors: *Aquifers, *Geochemistry, *Groundwater quality, *Madison Aquifer, *Model studies, *Water chemistry, Carbonates, Dolomite, Groundwater dating, Hydraulic conductivity, Isotope studies, Montana, South Dakota, Stable isotopes, Sulfates, Sulfides, Wyoming.

Stable isotope data for dissolved carbonate, sulfate, and sulfide were combined with water composition data to construct geochemical reaction models along eight flow paths in the Madison aquifer in parts of Wyoming, Montana, and South Dakota. All reaction models reproduce the observed chemical and carbon and sulfur isotopic composition of the final waters and are partially validated by predicting the observed carbon and sulfur isotopic compositions of dolomite and anhydrite from the Madison Limestone. The geochemical reaction models indicate that the dominant groundwater reaction in the Madison aquifer is dedolomitization (calcite precipitation and dolomite dissolution driven by anhydrite dissolution). Sulfate reduction, (Ca(2+) + Mg(2+))/Na(+) cation exchange, and halite dissolution are locally important, particularly in central Montana. The groundwater system was treated as closed to CO2 gas from external sources such as the soil zone or cross-formational leakage but open to CO2 from oxidation of organic matter coupled with sulfate reduction and other redox processes occurring within the aquifer. Carbon 14 groundwater ages, adjusted for the modeled carbon mass transfer, range from modern to about 23,000 years B.P. and indicate flow velocities of 2.1-26.5 m/yr. Most horizontal hydraulic conductivities calculated from Darcy's Law using the average 14C flow velocities are within a factor of 5 of those based on digital simulation. The calculated mineral mass transfer and adjusted 14C groundwater ages permit determination of apparent rates of reaction in the aquifer. The apparent rate of organic matter oxidation is typically 0.12 micromol/L/yr. Sulfate and, to a lesser extent, ferric iron are the predominant electron acceptors. The (kinetic) biochemical fractionation of 34S between sulfate and hydrogen sulfide is approximately -44 ppt at 25 C, with a temperature variation of -0.4 ppt/C. The rates of precipitation of calcite and dissolution of dolomite and anhydrite typically are 0.59, 0.24, and 0.95 micromol/L/yr, respectively. (Author's abstract)

Descriptors: *Aquatic bacteria, *Dissolved organic carbon, *Eutrophic lakes, *Limnology, *Phytoplankton, *Primary productivity, Algae, Bacterial physiology, Carbon cycle, Germany, Grosser Muggelsee, Radioactive tracers.

In 1987, the carbon flow from phytoplankton to bacteria in a eutrophic shallow lake, Grosser Muggelsee (Berlin), was calculated from measurements of extracellular organic carbon (EOC) release, respiration, and grazing by herbivorous zooplankton. The bacterial production amounted to approximately one half of the primary production and had a similar time course. Net release of EOC due to exudation was smaller than 3% of the particulate primary production. In order to investigate the discrepancy between the relatively high bacterial production and the small amounts of released EOC, the exudate incorporation was estimated by fractional filtration. The radioactivity in the <3 microm fraction was only 3% of the total primary productivity and that in the <12 microm fraction was only 8%. This indicates either a close morphological coupling between algae and bacteria or, in the case of the dominance of suspended bacteria, dissolved organic carbon sources for bacterial production other than phytoplankton exudation. From measurements of algal losses, calculations indicated that an average of 22% of the primary product was respired and 23% was grazed. It was assumed, therefore that a considerable part is lost due to lysis and serves as a carbon source for bacterial production. (Author's abstract)

Descriptors: *Adirondack Mountains, *Huntington Forest, *Lysimeters, *Soil chemistry, *Soil solution, *Soil types, *Soil water, *Water analysis, *Water chemistry, Acidity, Ammonia, Calcium, Chemical analysis, Data acquisition, Magnesium, New York, Nitrates, Nitrogen, Spatial variation, Sulfates.

Solutes were monitored from the soil of a beech-maple forest and an adjacent lake at the Huntington Forest in the Adirondack Mountains of New York. The predominant ions were Ca and SO4. For soil solutions collected by lysimeters, the highest concentration of most ions (H, NH4, Ca, Mg, and NO3) occurred in O horizon leachates, and the lowest concentrations beneath the spodic B horizon. However, Al and SO4 concentrations were highest beneath the B horizon. Concentrations of NO3 showed distinct seasonal variation. Values reached 60 microequiv/L in the spring and decreased to near zero late in the growing season. Coefficients of variation (CV) differed among horizons. The E horizon was generally the most variable (CV, 17-199%) and the B horizon the least

(CV 19-166%). Variation was especially high for NO3 and NH4, which had minimum CVs of 124% and 122%, respectively. Variation in these ions was likely due to the dominant role of biological processes in affecting nitrogen dynamics. Differences in soil solution concentrations among six soil pits were due to the spatial variation in soil properties rather than differences among the four types of lysimeters (tension, zero tension, fritted glass, and ceramic plate). Nitrogen species showed the greatest response to the installation of lysimeters, with elevated concentrations of NO3 (120-160 micro equiv/L) observed during the first two years after installation. HEAVY METALS IN SEDIMENTS OF THE YAMUNA RIVER (A TRIBUTARY OF THE GANGES), INDIA.
Oil and Natural Gas Commission, Anklesvar (India).
P. K. Jha, V. Subramanian, R. Sitasawad, and R. Van Grieken.
The Science of the Total Environment STENDL, Vol. 95, p 7-27, June 1990. 10 fig, 6 tab, 45 ref.

Descriptors: *Geochemistry, *Heavy metals, *India, *Rivers, *Sediment analysis, *Sediment distribution, *Sediment transport, Copper, Iron, Lead, Manganese, Particulate matter, Regression analysis, Yamuna River, Zinc.

Yamuna River sediments are more enriched in metals than those of the Ganges and average

Indian river sediments. Variations of metals in suspended, bed, and core sediment are due to the varying proportions of grain size and mineral content. Iron, manganese and lead show a preference for the oxide fraction, whereas copper and zinc are predominant inorganic and carbonate fractions of sediments. Of the total elemental content, 80 percent manganese, 78 percent iron, 69 percent lead, 67 percent copper and 55 percent zinc are available to chemically mobile phases of the sediments. The high partition coefficient of metals with respect to manganese suggests similar chemical mobility and preferences for solid phases. River sediments in the vicinity of Delhi show an increase in sorption of metals downstream, consequently metals are retained in sediments. The high correlation coefficient and significant regression relation among the metals indicate their similar behavior during transport. At Allahabad, the contribution of the Yamuna to the Ganges is 3200 tons of lead per year, 12,100 tons of zinc per year and 8500 tons of copper per year in particulate form. (Author's abstract)

Coastal marine sediments are sites of biological processes closely coupled with nutrient regeneration of deposited organic materials. Ammonification and ammonium assimilation in slurries of surface sediments from Japanese coastal and estuarine areas were studied with 15NH4(+) tracers. In completely aerobic sediments, where NO3-, reduction is negligible, the Blackburn 15NH4(+) dilution model can be applied to estimate the ammonification rate after a correction for nitrification is made. In semiaerobic sediments, where significant nitrate reduction occurs, a mathematical model based on the change of 15NH4(+) and 15NH4(-) with time was successfully applied to estimate the ammonification rate. The rate of NH4+ assimilation can be obtained directly from the incorporation of 15NH4(+) into particles in the sediments after correcting for 15NH4(+) dilution during incubation. The rate of ammonification ranged from 5.8 to 220 ng-atoms N /(g sediment) /h and that of NH4+ assimilation ranged from 6.2 to 114, indicating both large seasonal and local variations. Both NH4+ assimilation and ammonification were significantly correlated with ATP biomass, NH4+, and organic N contents in sediments. Several lines of evidence also suggested that NH4+ assimilation is primarily an aerobic microbial process. (Author's abstract)

Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 296-312, March 1990. 11 fig, 5 tab, 61 ref.
NSF Grants OCE 84-06526 and OCE 84-06524.

Descriptors: *Biomass, *Chesapeake Bay, *Estuaries, *Marine bacteria, *Organic matter, *Phytoplankton, Carbon cycle, Coastal waters, Copepods, Organic carbon, Predation, Seasonal variation.

Temporal variations in the contributions of phytoplankton and bacterioplankton to the pool of suspended organic matter (POC) were studied in the coastal plume of Chesapeake Bay. A combination of Eulerian and Lagrangian approaches was used to determine the spatial structure of the plume and to obtain time series of biological properties and rates within the plume. Plume structure was determined from areal surveys (mapping), and time series were conducted while following surface drifters. The turnover rate of POC increased seasonally with temperature as the proportions of POC accounted for by bacterioplankton increased relative to phytoplankton. The proportion of phytoplankton productivity that cycled through bacterioplankton averaged 13% and showed little seasonal variability. These results imply changes in the pathways and rates by which phytoplankton and bacterioplankton production were consumed or exported from the plume. Time series of 1-3 d next to surface drifters within the plume provided some insight into the nature of these changes. In February, when the turnover rate of POC was low, phytoplankton biomass declined relative to bacterioplankton due to sedimentation of large diatoms. Low bacterioplankton biomass was associated with high rates of predation by heterotrophic microflagellates. In August, when POC was turning over rapidly, phytoplankton biomass declined relative to bacterioplankton due to selective grazing by copepods. High bacterioplankton biomass appeared to be a consequence of enhanced DOC flux associated with high copepod grazing and POC turnover rates as well as with low predation by heterotrophic microflagellates. PERIODIC BACTERIVORE ACTIVITY BALANCES BACTERIAL GROWTH IN THE MARINE ENVIRONMENT.
Umea Univ. (Sweden). Dept. of Microbiology.
J. Wikner, F. Rassoulzadegan, and A. Hagstrom.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 313-324, March 1990. 5 fig, 4 tab, 55 ref.

Descriptors: *Food chains, *Marine bacteria, *Marine environment, *Predation, Biomass, Diurnal variation, Grazing, Laboratory methods, Organic matter, Protozoa.

Information on spatial and temporal patterns in bacterivory are central to understanding the cycling of organic matter in the sea. The grazing rate of pelagic bacteria was repeatedly determined during 36-h time-course experiments with the minicell recapture technique. Diel variation in the rate of grazing occurred in all water masses investigated. Maximal rates reached 200,000 cells/ml /h, whereas minimal values were 20 times lower. Highest grazing rates were found during the day in most cases, but grazing could also dominate at night as found in one study. Diel periodicity was mainly due to variation in the per-cell feeding rate of bacterivorous flagellates. Accumulation of the bacterial biomass into the 1-3 micron size fraction was positively correlated with changes in bacterial grazing. The transfer efficiency to organisms > 10 microns was low. On average, the daily grazing rate equaled 60% of the bacterial standing stock, exceeding bacterial growth by a factor of 2.6, as estimated from H3-thymidine incorporation. (Author's abstract)

Rates of microbially mediated sedimentary organic carbon remineralization vary along the salinity gradient of the White Oak River estuary, N.C. A direct comparison of two sites, one upriver dominated by methanogenesis and one downriver dominated by sulfate reduction, indicates a more rapid rate of remineralization upriver. Measurements of diffusive sigma CO2 flux plus CH4 diffusive (56%) and bubble (44%) fluxes at the upriver freshwater site from June 1986 to March 1988 yield an average yearly flux of 1.35 +/-0.35 mmol/square m/h. At the downriver midestuarine site, the dominant sigma CO2 flux for the same period is 0.46 +/-0.02 mmol/square m/h. The uncertainties in these yearly fluxes are calculated from observed ranges in duplicate flux measurements. About 43% of the incoming organic C is remineralized at both sites. The greater remineralization upriver, of which 47% can be attributed to methanogenesis, appears to be supported by rapid decomposition of detritus derived from freshwater, emergent and submersed macrophytes, including Pontederia, Ceratophyllum, and Najas in surficial sediments. The high organic C content of these upriver sediments may, however, result from the long-term storage of slower degrading plants, such as Typha and Taxodium. (Author's abstract)

EPISODIC CHANGES IN LATERAL TRANSPORT AND PHYTOPLANKTON DISTRIBUTION IN SOUTH SAN FRANCISCO BAY.
Geological Survey, Menlo Park, CA.
L. M. Huzzey, J. E. Cloern, and T. M. Powell.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 472-478, March 1990. 5 fig, 23 ref.

Descriptors: *Coastal waters, *Estuarine environment, *Phytoplankton, *San Francisco Bay, *Tidal effects, Biomass, Distribution patterns, Nutrients, Seasonal variation, Tidal energy, Wind tides.

Observations in South San Francisco Bay during 1982 showed that substantial cross-channel, nontidal flows accompanied episodic increases in the longitudinal, nontidal flows. Along the channel the nontidal circulation was enhanced during the monthly minima in tidal energy or as a result of wind forcing, producing up-estuary flows 2-3 times greater than normal. These longitudinal pulses modified the horizontal and vertical salinity distributions and generated cross-channel flows of up to 0.07 m/s that persisted for several days. The increased lateral flows were directed to the west and may explain the large fluctuations in phytoplankton biomass observed over the broad eastern shoal during spring. These findings apply to other constituents, such as planktonic larvae, nutrients, or suspended sediments, which also can have large horizontal gradients in estuaries. (Author's abstract)

OCEANIC AND ESTUARINE AMMONIUM OXIDATION: EFFECTS OF LIGHT.
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
S. G. Horrigen, and A. L. Springer.
Limnology and Oceanography LIOCAH, Vol. 35, No. 2, p 479-482, March 1990. 2 fig, 1 tab, 26 ref.

Descriptors: *Ammonium, *Bacterial physiology, *Chesapeake Bay, *Nitrification, Biological oxidation, Estuarine environment, Marine bacteria, Marine environment, Nitrogen cycle, Photoinhibition.

Photoinhibition of nitrification has been demonstrated in cultures of soil and marine bacteria as

well as in field samples from marine environments. The effects of light on the oxidation of ammonium to nitrite by cultures of oceanic and marine bacteria which are ammonium oxidizers were studied. Inhibition of ammoium oxidation by light was more pronounced in the oceanic isolates. The estuarine bacteria, isolated from Chesapeake Bay, produced nitrite at a rate faster than the oceanic isolates. Rates of ammonium oxidation in estuaries are generally greater than those in coastal seas and are much greater than those in the opean ocean for several reasons: higher levels of ammonium in estuaries would lead to faster rates of ammonium oxidation; greater turbidity in estuaries decreases light penetration and the particles may provide a substratum for ammonium-oxidizing bacteria; and the shallow depth of most estuaries allows occasional injection of sedimentary bacteria into the water column during major mixing events, which may increase the population of ammonium oxidizers in the water column. The results further indicate that reduced sensitivity to light may be an additional factor contributing to higher rates of ammonium oxidation in estuaries. (Author's abstract)

PHYTOPLANKTON BIOMASS, PRODUCTION AND GROWTH LIMITATIONS ON THE HUANGHE (YELLOW RIVER) CONTINENTAL SHELF.
Louisiana State Univ., Baton Rouge. Coastal Ecology and Fisheries Inst.
R. E. Turner, N. N. Rabalais, and Z. Z. Nan.
Continental Shelf Research CSHRDZ, Vol. 10, No. 6, p 545-571, 22 fig, June 1990. 6 tab, 42 ref.

Descriptors: *Biomass, *Coastal waters, *Growth, *Huang He River, *Phytoplankton, *Productivity, Growth rates, Light intensity, Nitrogen, Nutrients, Phosphorus, Pigments, Population dynamics, Salinity.

Phytoplankton populations were examined in coastal waters of the Huanghe estuary during two cruises in the annual high and normal discharge periods: August 1986 and October 1987, respectively. Strong salinity, nutrient and phytoplankton pigment concentration gradients occur along the 5 m isobath. Landward of these gradients, the phytoplankton growth potential (PGP) appears strongly phosphorous limited, while light limitation of PGP, paradoxically, appears less significant than it does offshore where the euphotic zone depth is greater. Phytoplankton pigments are sparse both in the river and far off shore, and the peak accumulation is centered broadly between 20 and 25 ppt, thus straddling the region of the hypopycnal plume from the hypopycnal plunge point to where Secchi disk depth exceeds 1 m. As the suspended matter falls out (sharply) near the 25 ppt isohaline, light conditions improve, the N:P ratio drops to below 100, and nitrate concentrations continue to decrease in an offshore direction. Phytoplankton production rates reach a maximum, and large algal cells accumulate, where the suspended particulate matter concentration drops to less than 10 mg/L. Both phytoplankton biomass production declines beyond approximately 32 ppt. Sedimentary pigment accumulations increase going from land to sea. Phosphorous and nitrogen dominate the suite of nutrients tested to determine which nutrients limit PGP. Phosphorous is probably the major nutrient limiting phytoplankton growth (not necessarily biomass accumulation) in most of the Huanghe estuary. This conclusion is based on the very high N:P ratios of dissolved nutrients, the results of an extensive array of addition and deletion bioassay experiments, and the results of P addition experiments. Where trace metals and EDTA limit PGP, they are usually limiting in concert with other nutrients and do not act alone. Comparison with other large river plumes are made. (Author's abstract)

HYDRODYNAMIC MODEL FOR WIND-DRIVEN AND TIDAL CIRCULATION IN THE ARABIAN GULF.
University of Petroleum and Minerals, Dhahran (Saudi Arabia). Water Resources and Environment Div.
A. H. Al-Rabeh, N. Gunay, and H. M. Cekirge.
Applied Mathematical Modelling AMMODL, Vol. 14, No. 8, p 410-419, August 1990. 8 fig, 2 tab, 57 ref.

Descriptors: *Arabian Gulf, *Hydrodynamics, *Hydrologic models, *Mathematical models, *Tidal currents, *Wind-driven currents, Eddies, Topography, Water circulation, Water currents, Wind velocity.

The vertical/horizontal splitting (VHS) model was extended and adapted to simulate tidal and wind-driven circulation in the Arabian Gulf. The extensions included the use of finite differences for the depth-averaged equations, the use of the depth following coordinate in the vertical, and relating the bottom friction to the bottom velocity. The VHS model was adapted to the Persian Gulf (Arabian Gulf) using two implementations. The first, HYDRO1, simulated wind-driven and/or tidal circulation in the Arabian Gulf. A two-block grid system in cartesian coordinates was used with a finer grid on the western coast of the gulf. The second, HYDRO2, simulated wind-driven and/or tidal circulation in any user-defined area in the Arabian Gulf. HYDRO2 enables the user to study in detail a specific region of interest in the gulf. HYDRO2 was used to simulate tidal and wind-driven circulation in the region of Abu Ali, represented by a 10 by 10 grid with a grid size of approximately three km. A northwesterly synthetic wind with a maximum speed of 10 m/sec was applied. Wind direction was considered constant, and wind speed was computed as a Gaussian function of time. Both implementations carry out three-dimensional computation when the conventional two-dimensional hypotheses are locally inadequate and when specified by the user. Elsewhere, two-dimensional computation is employed. Implementation and testing details include specification of appropriate eddy viscosity profile, wind drag coefficient, and Chezy coefficient. (Brunone-PTT)

PROCESSES GOVERNING MARSH FORMATION IN A RAPIDLY SUBSIDING COASTAL ENVIRONMENT.
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
R. D. DeLaune, W. H. Patrick, and N. Van Breeman.
Catena, Vol. 17, No. 3, p 277-288, June 1990. 4 fig, 2 tab, 23 ref.

Descriptors: *Coastal marshes, *Deltas, *Mississippi River, *Salt marshes, *Subsidence, *Wetlands, Accretion, Decomposing organic matter, Oxidation, Plant growth, Plant nutrients, Plant physiology, Sediments, Soil compaction, Water level fluctuations.

Processes governing the stability of marshes in Louisiana's Mississippi River delta plain were examined. An accretionary budget was developed for Barataria Basin fresh, brackish-intermediate, and salt marshes located along a salinity gradient extending inland from the coast. The marshes represent a thin veneer overlying sediment strata deposited by the Mississippi River and its predecessors. At many location rates of vertical marsh accretion were not sufficiently rapid to keep pace with increased water depth accompanying rapid subsidence due to compaction. The life span of salt marshes of the Mississippi River deltaic plain are estimated to be approximately 100 years. The mineral sediment and organic carbon requirement of individual marsh units in response to water level was determined. Organic matter is an important component of accretionary processes and helps the marsh surface to keep pace with water level increases. An estimated 600 to 700 g of carbon/sq m per year must be supplied to maintain marsh accretion to balance soil oxidation-decomposition losses and organic carbon accretion (peat formation). Even though subsidence is the primary factor in marsh deterioration, accompanying factors (soil water intrusion, excess waterlogging) stress vegetation and thus reduce the organic carbon source below minimum aggradation requirements. Inorganic sediment input is also necessary for maintenance of viable marshes. Many of the marshes within the basin are not receiving sufficient nutrients from sediment sources to maintain significant plant growth necessary for organic matter production. Barataria Basin marsh will likely continue disappearing unless means are implemented for reintroducing sediment from the Mississippi River (Author's abstract)
W91-01088

DIRECT IMPACTS OF OUTER CONTINENTAL SHELF ACTIVITIES ON WETLAND LOSS IN THE CENTRAL GULF OF MEXICO.
Louisiana State Univ., Baton Rouge. Center for Energy Studies.
R. H. Baumann, and R. E. Turner.
Environmental Geology and Water Sciences EGWSEI, Vol. 15, No. 3, p 189-198, May/June 1990. 2 fig, 6 tab, 13 ref.

Descriptors: *Continental shelf, *Gulf of Mexico, *Louisiana, *Resource management, *Wetlands, Aerial photography, Field surveys, Navigation canals, Pipelines, Right-of-way.

The direct impacts of outer continental shelf (OCS) development on recent wetland loss in the northern Gulf of Mexico were quantified using aerial imagery, field surveys, and literature review. The total direct impacts accounted for an estimated 25.6% of total net wetland loss within the Louisiana portion of the study area from 1955/1956 to 1978. Of the total direct impacts of 73,905 ha, OCS-related activities accounted for 11,589 to 13,631 ha of the wetland loss during the same interval. Although this is a substantial areal loss, it represents only 4.0 to 4.7 percent of the total Louisiana wetland loss from 1955/1956 to 1978, and 15.7 to 18.4 percent of direct impacts. Direct impacts from OCS pipelines averaged 2.49 ha/km, lower than published guidelines, and totalled 12,012 ha. Lowest impacts are for backfilled pipelines in the Chenier Plain of western Louisiana and for small young pipelines built in clustered rights-of-way. Widening of OCS pipeline canals does not appear to be an important factor for total net wetland loss in the coastal zone because few pipelines are open to navigation and, for the examples found, the impact width was not significantly different than for open pipelines closed to navigation. Navigation channels account for a minimum of 16,902 ha of habitat change. Direct impacts per unit length of navigation channel average 20 times greater than pipelines. (Author's abstract)

LONGITUDINAL DISPERSION PROCESSES IN THE UPPER TAMAR ESTUARY.
Birmingham Univ. (England). Dept. of Civil Engineering.
J. R. West, R. J. Uncles, J. A. Stephens, and K. Shiono.
Estuaries ESTUDO, Vol. 13, No. 2, p 118-124, June 1990. 5 fig, 25 ref.

Descriptors: *Dispersion, *Estuaries, *Salinity, *Sediment transport, *Solute transport, *Tamar Estuary, *Tidal hydraulics, Saline-freshwater interfaces, Suspended sediments, Temporal distribution.

Measurements of velocity, salinity, and suspended solids concentration across a section of the upper Tamar Estuary for a spring and neap tidal cycle have been used to investigate the intra-tidal variation of vertical and transverse shear-induced dispersion. The interaction of vertical shear and longitudinal salinity-induced gradient leads to fairly well-mixed flood tide conditions and stable ebb tide conditions. Sediment transport is associated with active vertical momentum transport; the dispersive flux is generally $<10\%$ of the advective flux. The dispersive particulate flux is landward

during the ebb and seaward during the flood; the tidal average dispersal is very small compared with tidal average advective effects. The fluvial and dispersive fluxes of solute are approximately equivalent; the solute dispersive flux is important for the study of salinity intrusion problems. The transverse shear solute dispersion coefficient was found to be about 10% of the maximum values of vertical shear dispersion coefficient. The tidal pumping mechanism is a significant contribution to tidally averaged fluxes in the upper reaches of estuaries and are probably inappropriate where tidal range is greater than low water depth. The asymmetry of the temporal variation may be used to postulate causative mechanisms for landward and seaward fluxes that have previously been suggested as evidence of gravitational circulation effects. TIDAL STRAINING, DENSITY CURRENTS, AND STIRRING IN THE CONTROL OF ESTUARINE STRATIFICATION.
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
J. H. Simpson, J. Brown, J. Matthews, and G. Allen.
Estuaries ESTUDO, Vol. 13, No. 2, p 125-132, June 1990. 6 fig, 16 ref.

Descriptors: *Density currents, *Density stratification, *Estuaries, *Stratification, *Tides, Buoyancy, Liverpool Bay, Saline-freshwater interfaces, Stirring.

Buoyancy input as fresh water exerts a stratifying influence in estuaries and adjacent coastal waters. Predicting the development and breakdown of such stratification is an inherently more difficult problem than that involved in the analogous case of stratification induced by surface heating because the buoyancy input originates at the lateral boundaries. In the approach adopted here, the energy considerations were used in the surface heating problem to describe the competition between the stabilizing effect of fresh water and the vertical mixing brought about by tidal and wind stirring. Freshwater input induces horizontal gradients which drive the estuarine circulation in which lighter fluid at the surface is moved seaward over heavier fluid moving landward below. This contribution to stratification is expected to vary in time as the level of turbulence varies over the tidal cycle. The density gradient also interacts directly with the vertical shear in the tidal current to induce a periodic input to stratification which is positive on the ebb phase of the tide. Comparison of this input with the available stirring energy leads to a simple criterion for the existence of strain-induced stratification. Observations in a region of Liverpool Bay satisfying this criterion confirm the occurrence of a strong semidiurnal variation in stratification with complete vertical mixing apparent around high water except at neap tides when more permanent stratification may develop. A simulation of the monthly cycle based on a model including straining, stirring, and the estuarine circulation is in qualitative agreement with the main features of the observations. (Author's abstract)

Descriptors: *Dispersion, *Estuaries, *Saline-freshwater interfaces, *Salinity, *Salt balance, *Tidal hydraulics, Seasonal variation, Tamar Estuary.

A one-dimensional, hydrodynamical model of the Tamar Estuary shows good agreement with measured tidal elevations and currents. Computed currents are used to drive a one-dimensional, moving-element model of the salt balance. The moving-element model overcomes the numerical difficulties associated with strong tidal advection. Axial distributions of salinity at high water, computed using the moving-element model, compare well with measurements. The modelled and observed high water salinity distributions in this macrotidal estuary show little dependence on tidal range. The major variability in salinity is due to runoff. This strong and rapid dependence on runoff is a consequence of short residence (or flushing) times. Typically, residence times are less than one day throughout the year in the upper 10 km of estuary. The residence times maximize in summer, reaching 14 d for the whole estuary. During high runoff winter periods residence times are less than 5 d. Mixing coefficients for the moving-element salinity model are deduced from salinity measurements. Dispersion coefficients at fixed locations along the estuary are deduced from solutions of the salinity model. The spatially-averaged coefficients at mean spring and neap tides are 180 and 240 sq m/s, respectively, for average runoff. Therefore, spring-neap variations in dispersion are fairly small and show a negative correlation with tidal range. The spatially-averaged dispersion coefficients at mean tides vary from 150 to 300 sq m/s for typical summer and winter runoff, respectively. The increase in dispersion with runoff and the decrease with tidal range implies that buoyancy-driven currents generate an important component of the shear dispersion in this estuary. SALINITY STRATIFICATION IN A RIVER-DOMINATED ESTUARY.
Alabama Marine Resources Lab., Dauphin Island.
W. W. Schroeder, S. P. Dinnel, and W. J. Wiseman.
Estuaries ESTUDO, Vol. 13, No. 2, p 145-154, June 1990. 8 fig, 1 tab, 38 ref. DOC NOAA Office of Sea Grant No. NA81AA-D-0050 (Project R/ER-14PD).

Descriptors: *Estuaries, *River flow, *Saline-freshwater interfaces, *Salinity, *Stratification, Alabama, Mobile Bay.

Analysis of salinity data from Mobile Bay indicates that stratification-destratification events within this broad, shallow estuary are not uncommon. These events are related to the strength of the winds, through their influence on wave generation and subsequent bottom drag coefficient increases, and to the strength of river discharge. They do not appear to be due to the strength of tidal currents, as has been observed elsewhere. Furthermore, river flow appears to be the dominant control, the winds being important only in the absence of large freshwater discharges. The annual spring freshet can flush most of the salt from the bay. During other times of the year the relative strengths of river discharge and wind stress change the bay from highly stratified to nearly homogeneous and back on a variety of time scales ranging from daily to seasonal. TEMPORAL VARIABILITY OF REMOTELY SENSED SUSPENDED SEDIMENT AND SEA SURFACE TEMPERATURE PATTERNS IN MOBILE BAY, ALABAMA.
New Orleans Univ., LA. Center for Research in Ocean and Space Sciences.
J. B. Rucker, R. P. Stumpf, and W. W. Schroeder.
Estuaries ESTUDO, Vol. 13, No. 2, p 155-160, June 1990. 5 fig, 9 ref. DOC NOAA Office of Sea Grant No. NA81AA-D-0050 (Project R/ER-14PD).

Descriptors: *Estuaries, *Mobile Bay, *Remote sensing, *River discharge, *Suspended sediments, *Temperature, Alabama, Infrared imagery, Satellite technology, Temporal variation.

Distribution patterns of suspended sediments and sea surface temperatures in Mobile Bay were derived from algorithms using digital data from the visible, near infrared, and infrared channels of the Advanced Very High Resolution Radiometer (AVHRR) on the NOAA-TIROS-N satellite. Closely spaced AVHRR scenes for January 20, 24, and 29, 1982, were compared with available environmental information taken during the same period. A complex interaction between river discharge, winds, and astronomical tides controlled the distribution patterns of suspended sediments. These same variables, coupled with air temperatures, also governed the distribution patterns of sea surface temperatures. (See also W91-01130) (Author's abstract)

DETERMINATION OF THE ORIGIN OF SUSPENDED MATTER AND SEDIMENTS IN THE ELBE ESTUARY USING NATURAL TRACERS.
Technische Univ. Hamburg-Harburg (Germany, F.R.). Arbeitsbereich Umweltschutztechnik.
J. H. Schoer.
Estuaries ESTUDO, Vol. 13, No. 2, p 161-172, June 1990. 11 fig, 2 tab, 34 ref.

Descriptors: *Carbonates, *Elbe Estuary, *Estuaries, *Sediment transport, *Suspended load, *Suspended sediments, *Suspended solids, *Tracers, Clays, Hafnium, Kaolinite, Saline-freshwater interfaces, Zircon.

The clay mineral composition, the concentrations of carbonates, the proportions of carbon and oxygen isotopes in carbonates and organic matter, as well as the concentrations of different nonanthropogenic metals were used to determine the origin of different grain size fractions of sediments and suspended matter in the Elbe estuary. Analysis of the smectite/kaolinite proportion revealed that solid material <// = 2 micron from the North Sea is transported up the river, about 40 km beyond the most upstream position of the salt wedge. In the 2-20 micron fraction, the 16O/18O ratio in carbonates and the kaolinite/chlorite proportion demonstrate a transport of North Sea material between 40 and 20 km upstream of the marine water limit. The transport behavior of the 20-63 micron grain size fraction could be determined by the hafnium concentration, representative for the heavy mineral zircon. In this case, the transport distance beyond the salt wedge was up to 20 km. No information was available on the origin of the fine organic matter, whereas the coarser fractions were derived primarily from debris of salt marsh vegetation. The results demonstrate that in the Elbe estuary mixing between marine and fluvial solid material occurs upstream of the salt wedge and is significantly responsible for the observed decrease in the concentration of various pollutants in sediments and suspended matter along the estuary. The cause of the upstream particle transport is probably a scour lag mechanism based on asymmetries of the flood-tide and ebb-tide current distribution, especially their differing maximum velocities. MACROINFAUNAL COMMUNITY OF A TROPICAL ESTUARINE LAGOON.
Center for Energy and Environment Research, Mayaguez, PR.
A. W. Stoner, and C. Acevedo.
Estuaries ESTUDO, Vol. 13, No. 2, p 174-181, June 1990. 4 fig, 5 tab, 40 ref. NOAA Office of Sea Grant No. R/A-01-2 and NSF Grant No. R-II-8610677.

Descriptors: *Benthic fauna, *Coastal lagoons, *Estuaries, *Estuarine environment, *Puerto Rico, *Species composition, *Tropical regions, Laguna Joyuda, Oligochaetes, Polychaetes, Seasonal variation.

The benthic macroinfauna of Laguna Joyuda, a coastal lagoon in Puerto Rico, was surveyed for two years. Seven hundred fifty core samples yielded 23 macrobenthic taxa. The oligochaete Thalassodrilides gurwitschi comprised 43.4% of the number of individuals collected. Polychaetes comprised 35.4% of the individuals, including Capitella cf. capitata, Dasybranchus lumbricoides, and Steninonereis martini in approximately equal numbers. The amphipod Grandidierella bonnieroides made up 11.5% of the community. The lagoon yielded fewer species than other tropical estuaries in the

LIBRARY U. OF L. URBANA-CHAMPAIGN

Caribbean and Atlantic, but the trophic composition, mostly deposit feeders, was similar. Seasonal patterns in the abundance of individuals were most pronounced in the central basin, with maximum number of organisms during the wet season, and a minimum in the dry season. Responses to rainfall events, however, were variable and probably related to migration patterns in predators. Macrofaunal biomass demonstrated a high degree of annual variation at all sampling stations with a marked increase in 1987. Low macrofaunal biomass, lack of temporal association with physical-chemical conditions, and inverse relationships with predator populations suggest that patterns of macrofaunal abundance in Laguna Joyuda are mediated primarily by biotic mechanisms. STRUCTURE AND FUNCTION OF DRY WEATHER MANGROVES ON THE PACIFIC COAST OF CENTRAL AMERICA, WITH EMPHASIS ON AVICENNIA BICOLOR FORESTS.
Universidad Nacional Autonoma de Heredia (Costa Rica). Escuela Ciencias Biologicas.
J. A. Jimenez.
Estuaries ESTUDO, Vol. 13, No. 2, p 182-192, June 1990. 7 fig, 4 tab, 25 ref.

Descriptors: *Central America, *Mangrove swamps, *Semiarid climates, *Wetlands, Coastal areas, Rainfall, Runoff, Soil water.

Mangrove forests along the Pacific Coast of Central America cover around 4,000 sq km. Most of this coast is occupied with tropical dry forest mangroves where basal areas range between 6 and 20 sq. m/ha and canopy heights rarely exceed 20 m. Rainfall and runoff alter structure and floristic composition from site to site. Reproductive phenology and mortality appear to be related to soil water availability. Avicennia bicolor forests reach a density of 4,350 plants that are taller than 0.50 m/ha, with 769 trees above 5 cm diameter at breast height. A total basal area of 41 sq m/ha together with a canopy height of about 23 m place these forests among the most developed in the western hemisphere. Growth rate (0.38 sq m/ha/yr) is surprisingly high for mangrove forests under a seasonal dry climate. (Author's abstract)

CANANEIA LAGOON ESTUARINE SYSTEM, SAO PAULO, BRAZIL.
Sao Paulo Univ. (Brazil). Inst. Oceanografico.
Y. Schaeffer-Novelli, H. S. L. Mesquita, and G. Cintron-Molero.
Estuaries ESTUDO, Vol. 13, No. 2, p 193-203, June 1990. 2 fig, 50 ref.

Descriptors: *Coastal lagoons, *Estuaries, *Estuarine environment, *Mangrove swamps, *Subtropic zone, Brazil, Photosynthesis, Primary production, Water budget.

The Cananeia Lagoon estuarine system lies at 25 degrees S, near the latitudinal limit for mangroves. It is 110 km long, consisting of 1-3 km wide channels behind a barrier island, with narrow inlets at the southern and northern ends. Average and maximum depths are 6 m and 12 m. The system is microtidal and subtropical. Mean annual temperature is 21.4 degrees C (annual amplitude = 7.0 degrees C). When the area receives sporadic frosts, temperatures close to 2 degrees C occur in the estuary. Annual precipitation (2,270 mm) exceeds annual potential evapotranspiration (1,656 mm). The water budget of the 1,339 sq km watershed is controlled primarily by local rainfall. Before 1978, a large river discharged a significant portion of its flow into the lagoon, but closure of the diversionary channel has since caused changes in salinity, phytoplankton populations, and mangrove coverage. About 90 sq km of intertidal habitat is occupied by mangroves and tidal marsh; mangroves are dominant. Fringe and riverine forests (dominated by Rhizophora) are more structurally developed than the basins dominated by Laguncularia and have higher litterfall rates (2.08 g/sq m/d, fringes; 1.04 g/sq m/d, basins). Primary production exhibits pronounced seasonal pulses; heterotrophic processes lag photosynthetic production and are partially driven by particulate matter inputs. Synthetic models must consider the spatial and temporal heterogeneity of this region. (Author's abstract)

Descriptors: *Brazil, *Coastal areas, *Forest ecosystems, *Mangrove swamps, Climates, Distribution patterns, Evapotranspiration.

Brazilian mangroves extend from 4 degrees 30 min N to 28 degrees 30 min S, varying greatly in growth form, species distribution patterns, and stand structure, in spite of a limited floristic diversity. The Brazilian coastline was divided into eight units, within which physiographic and climatic conditions are relatively uniform, and described mangrove occurrence, species distribution and structural attributes characteristic of each segment. In general, greatest mangrove coverage and greatest forest stature are found in area with a large surplus of rainfall over potential evapotranspiration and macrotidal regimes. An exception was the segment containing the mouth of the Amazon river, where freshwater systems dominate over brackish or marine associations. The variability in species associations and the dominance of each in a given environment is predominantly determined by the characteristics of the landforms that can be colonized by each species in a given region. The type, size, and frequency of occurrence of available landforms is a function of the particular mix of fluvial, tidal, and wave energies found in a region. Different species colonize these sites depending on their adaptations and edaphic preferences. Climate affects mangrove colonization and growth. It is suggested that Brazilian mangroves play a minor role in modifying the geomorphic setting; the spatial arrangement of the various forest types is a response to the underlying topography and edaphic conditions, and to the constraints imposed by climatic and hydrologic factors. The spatial arrangement of species does not necessarily show successional processes, but may be the result of direct and differential colonization on appropriate substrates. (Author's abstract)

TEST OF THE ASSUMPTIONS AND PREDICTIONS OF RECENT MICROALGAL GROWTH MODELS WITH THE MARINE PHYTOPLANKTER PAVLOVA LUTHERI.
Hawaii Univ., Honolulu. Dept. of Oceanography.
M. S. Chalup, and E. A. Laws.
Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 583-596, May 1990. 11 fig, 2 tab, 50 ref. Solar Energy Research Institute Subcontract XK-4-04109.

Descriptors: *Algal growth, *Marine algae, *Model studies, *Phytoplankton, Carbon, Chlorophyll a, Irradiation, Nitrogen, Nutrients.

The marine phytoplankter Pavlova lutheri was grown in both batch and continuous culture under various conditions of light and nitrate limitation in order to examine the accuracy of certain assumptions and predictions of microalgal growth models. The N:C ratio of the cells was found to be uniquely related to their relative growth rate. There was no unique relationship, however, between Chl a:C ratios and relative growth rate. Optical absorption coefficients normalized to Chl a were negatively correlated with relative growth rate at a fixed irradiance and positively correlated with irradiance at a fixed relative growth rate when light intensity was varied with neutral-density filters. Quantum yields were positively correlated with relative growth rate at a fixed irradiance and negatively correlated with irradiance at a fixed relative growth rate. Certain parameters or combinations of parameters which appear in nutrient-saturated growth models were found to be either independent of relative growth rate at a fixed irradiance or uniquely correlated with relative growth rate. This discovery facilitates extension of nutrient-saturated growth models to nutrient-limited conditions. (See also W91-01140) (Author's abstract)

MICROALGAL GROWTH MODEL.
Hawaii Univ., Honolulu. Dept. of Oceanography.
E. A. Laws, and M. S. Chalup.
Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 597-608, May 1990. 7 fig, 1 tab, 29 ref. Solar Energy Research Institute Subcontract XK-4-04109.

Descriptors: *Algal growth, *Limiting nutrients, *Limnology, *Model studies, *Photosynthesis, Carbon, Chlorophyll a, Irradiation, Nitrogen.

Recent experimental evidence has made it clear that effects of irradiance and nutrient limitation on light absorption and photosynthetic quantum yields of microalgae and the relationship between cellular N:C ratios and nutrient-limited growth rates are inconsistent with the assumptions and predictions of current models of algal growth. A new algal growth model was therefore developed to overcome these inconsistencies. The new model predicts a hyperbolic relationship between nutrient-saturated growth rates and irradiance and a linear relationship between growth rate and both respiration rate and Chl a:C ratios. The correlation between growth rate and Chl a:C is positive under nutrient-limited conditions and negative under nutrient-saturated (light-limited) conditions. The requirement that N:C ratios be linearly related to relative growth rates leads to the conclusion that the product of the Chl a-specific absorption coefficient and the quantum yield coefficient be hyperbolically related to nutrient-limited growth rates, a result consistent with experimental observations. The equations relating respiration rate and compositional ratios to absolute and relative growth rates appear to be insensitive to photoperiod. (See also W91-01139) (Author's abstract)

BACTERIAL MEDIATION IN THE UTILIZATION OF CARBON AND NITROGEN FROM DETRITAL COMPLEXES BY CRASSOSTREA VIRGINICA.
Maryland Univ., Cambridge. Center for Environmental and Estuarine Studies.
M. P. Crosby, R. I. E. Newell, and C. J. Langdon.
Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 625-639, May 1990. 8 tab, 76 ref. NSF Grant OCE 84-000200.

Descriptors: *Bacterial physiology, *Cycling nutrients, *Oysters, *Salt marshes, Carbon radioisotopes, Detritus, Nitrogen radioisotopes.

Unattached, cellulolytic bacteria isolated from a salt marsh were cultured on (15N)ammonium sulfate and (14C)glucose and fed to the American oyster Crassostrea virginica. Oysters were able to digest and assimilate bacterial C with an assimilation efficiency of 52.5%. It is estimated that free-living bacteria may be capable of supplying up to about 9.5% of the total C requirements of oysters in their natural habitat. Cellulolytic bacteria were also cultured on 14C-labeled refractory Spartina alterniflora particles as the sole C source and (15N)ammonium sulfate as a source of N. These labeled bacteria, together with the S. alterniflora, were fed to the oysters. The refractory C from these detrital complexes was assimilated by the oysters with an efficiency of 10.3%. It was significantly ($P=0.0007$) greater than the assimilation

efficiency of 2.7% measured in a previous study for oysters feeding on the refractory S. alterniflora substrate alone. This result provides direct experimental evidence that cellulolytic bacteria in the environment can contribute to the transfer of C from refractory detritus to an ecologically important suspension-feeding macroinvertebrate. C. virginica, when fed detrital complexes, assimilated bacterial N with an efficiency of 57.2% but that assimilation of total N present in the detrital complexes was only 3.4%. We speculate that this low assimilation efficiency was due to most (94%) of the N being in the form of condensation products such as humic geopolymers and extracellular polymeric substances secreted by bacteria which could not be digested and absorbed by the oysters. Calculations show that detrital complexes in the natural environment may provide a significant contribution to an oyster's C demand. The magnitude of this contribution can increase from 1.3 to 60% as both absolute bacterial abundance and proportion of bacteria attached to detrital particles increase, raising the oysters' efficiency of filtration for these substrates. (Author's abstract)

ROLE OF NUTRITION IN REGULATING THE POPULATION DYNAMICS OF OPPORTUNISTIC, SURFACE DEPOSIT FEEDERS IN A MESOHALINE COMMUNITY.
Maryland Univ., Solomons. Chesapeake Biological Lab.
A. G. Marsh, and K. R. Tenore.
Limnology and Oceanography LIOCAH, Vol. 35, No. 3, p 710-724, May 1990. 9 fig, 3 tab, 48 ref. NSF Grant No. OCE-85-16-751.

Descriptors: *Bivalves, *Brackish water, *Chesapeake Bay, *Estuarine environment, *Limiting nutrients, *Nutrition, *Population dynamics, Polychaetes.

The role of food resources in regulating seasonal population dynamics was determined in a benthic community typical of mesohaline regions in Chesapeake Bay. Four macroinvertebrates dominated the community: the bivalve Macoma balthica, the polychaetes Streblospio benedicti and Nereis succinea, and the amphipod Leptocheirus plumulosus. Several factors seem to regulate population dynamics at different times of the year. In March, growth and reproduction rates accelerated as temperature and phytodetrital sedimentation increased. In April, invertebrate growth rates plateaued while estimated community N requirements were equivalent to estimated N availability. In May, invertebrate growth and reproduction rates rapidly declined while estimated community energy requirements were greater than sedimenting energy supplies. In June, larval recruitment was heavy for S. benedicti and L. plumulosus; however, these juveniles showed no apparent growth during June and their densities rapidly declined. The sudden appearance and disappearance of these juveniles was solely responsible for the boom-and-bust dynamics of S. benedicti and L. plumulosus. Essential W3-polyunsaturated fatty acids and essential amino acids were present at high levels in spring but were present in only trace amounts during summer. Growth of juvenile S. benedicti and L. plumulosus recruits was most likely limited by food supply in June and July, especially by the availability of essential nutrients. Estimates of predation rates could not account for these population declines. (Author's abstract)

MULTIVARIATE STATISTICAL ANALYSES OF SEDIMENT GEOCHEMISTRY.
University of East Anglia, Norwich (England). School of Environmental Sciences.
A. Grant.
Marine Pollution Bulletin MPNBAZ, Vol. 21, No. 6, p 297-298, June 1990. 2 fig, 3 tab, 5 ref.

Descriptors: *Geochemistry, *Marine pollution, *Marine sediments, *Mineralogy, *Pollutant identification, *Statistical methods, *Water analysis, *Water chemistry, Australia, Calcium, Clays, Contaminated sediments, Copper, Heavy metals, Humber Estuary, Lead, Nickel, Silicon.

The effects of sediment mineralogy are often confounded by the effects of concentration differences caused by contamination. Multivariate statistical methods were used to identify locally elevated concentrations of elements in sediments which are usually attributed to man-made contamination, and not to sediment mineralogy. The commonest multivariate method used to identify man-made contamination involves the calculation of intersample similarities and the use of cluster analysis to identify similar groups. This approach is better suited for the identification of gross mineralogical differences than for identifying contamination. An example, copper levels in uncontaminated mud, is shown to be higher than copper levels in contaminated sand where both mud and sand came from the Humber estuary. Forty-five samples from New South Wales subjected to cluster analysis divided into three groups: one, high in clay minerals, represented by high levels of Ni, Cu and Pb; two, high in quartz, represented by high Si levels; and three, high in shell gravel, represented by high Ca levels. From these, and other related, data it is clear that the first group is relatively high in clay minerals, with which Ni, Cu, and Pb are usually associated; the second group represents sediments rich in quartz; while the third group represents sediment containing shell gravel. So, cluster analysis applied in this way does not achieve the desired purpose. An alternative method is principal component analysis (PCA), which determines new additive variables with account for a maximum proportion of the variance. (King-PTT)

BIOFILM CHARACTERISTICS IN COASTAL WATERS OF BOMBAY.
Naval Chemical and Metallurgical Lab., Bombay (India).
R. B. Srivastava, S. N. Gaonkar, and A. A. Karande.
Proceedings of the Indian Academy of Sciences (Animal Sciences) PIANDR, Vol. 99, No. 2, p 163-173, March 1990. 4 fig, 8 tab, 22 ref.

Descriptors: *Biofilms, *Bombay, *Coastal waters, *Fouling, *Heavy metals, Copper, India, Marine pollution, Nickel, Toxicity.

The generation of biofilms on metal and non-metal coupons which were immersed in Bombay coastal waters was studied in the field and in the laboratory. The nature of the biofilm formed varied from substrate to substrate, influenced by the quality of water, flow conditions, and the biotic status of the seawater. The biofilms, depending upon the degree of entrapment of the inorganic detritus, have varying weights. The biofilms formed on metallic surfaces, when compared with perspex surfaces, are both qualitatively and quantitatively richer. Cupronickel, despite its toxicity, supports denser films than those which developed on inert perspex surfaces. The metallic coupons, both inert and toxic, support thicker films in polluted waters than in clean waters. (Author's abstract)

NITROGEN CYCLING IN LOUISIANA GULF COAST BRACKISH MARSHES.
Louisiana State Univ., Baton Rouge. Lab. for Wetland Soils and Sediments.
R. D. DeLaune, and W. H. Patrick.
Hydrobiologia HYDRB8, Vol. 199, No. 1, p 73-79, July 17, 1990. 5 fig, 1 tab, 21 ref. NSF grant BSR-8413006.

Descriptors: *Brackish water, *Louisiana, *Nitrogen, *Nitrogen cycle, *Nitrogen fixation, *Salt marshes, *Wetlands, Ammonium, Nitrogen budget, Seasonal variation, Sediments, Soil profiles, Spartina.

Nitrogen fixation and nitrogen accumulation were measured in a Louisiana Spartina patens brackish marsh. Using the acetylene reduction technique calibrated with direct 15N2 assimilation, an equivalent of 90.0 microg N/g/yr was fixed. Fixation was greater in the summer months and in the upper portion of the soil profile. Extractable ammonium increased with depth and was negatively correlated with ethylene production. Average ammonium concentration in the sediment was 39 microg NH4(+) as N/g sediment. Cesium-137 dating of the soil profile showed the marsh was vertically accreting at a rate of 0.60 cm/yr. Calculations using verticai accretion rate, bulk density, and total nitrogen content of sediment indicate that the marshes are accumulating 7.2g N/sq m/yr, thus serving as a major nitrogen sink. By incorporating measured nitrogen fluxes with existing flux measurement a nitrogen budget was developed for the marsh. The data suggest that nitrogen fixation is the primary source of nitrogen in this marsh. These results are in contrast to the salt marshes nearer the coast where sediment input was definitely the primary source of nitrogen. (Author's abstract)

Descriptors: *Eddies, *Estuaries, *Fluid dynamics, *Oscillatory waves, *St Lawrence Estuary, *Waves, Canada, Mathematical analysis, Mathematical models, Mathematical studies, Model studies, Wave direction, Wave velocity.

The lower St. Lawrence estuary is an interesting case among estuaries in that it is wide enough to accommodate the development of mesoscale unstable waves and eddies. These features are generated by the runoff-driven jet along this body's south shore. Data are presented yielding estimates of the length, time and velocity scales of these unstable disturbances. To relate these quantities to the dynamics employed, a 2-layer quasigeostrophic instability model featuring realistic lateral shear. All model runs show short time and length scales, e-folding periods of less than 10 days and wavelengths of less than 50 km. The lower St. Lawrence estuary is an unusual domain for mesoscale unstable waves since it is semi-enclosed. The northern lateral boundary prevents eddies that are shed from the south-shore jet from migrating far offshore. This may imply re-interaction of the eddy with the south-shore jet, perhaps yielding a merging event or alternatively a new cycle of wave growth. (Author's abstract)

CLASSIFICATION OF ESTUARIES IN CHINA (IN CHINESE).
East China Normal Univ., Shanghai.
Y. H. Jin, H. T. Shen, and J. Y. Chen.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 21, No. 2, p 132-143, March 1990. 5 fig, 6 tab, 8 ref. English summary.

Descriptors: *China, *Estuaries, Changjiang River, Classification, Cluster analysis, Data interpretation, Huang He River, Qiantang River, River sediments, Sheyang River, Stream classification, Yangtze River, Yellow River, Zhujiang River.

The estuaries of China were classified into four basic types, by using data from 27 large rivers which were analyzed using fuzzy cluster analysis for those factors which influence the deformation, erosion-accumulation and evolution of an estuary. The comprehensive classification principle treats an estuary as a complex physiographic system including estuarine hydraulic behavior, sediment concentration and source and plane features. The four estuary types determined using this method are: 1) Qiantang river Estuary type, funnel-shaped, laterally inhomogeneous, sediment from the sea: 2) Transitional estuary type, subdivision one, Sheyang River Estuary type, meander type, partially mixed, sediment primarily from the sea; subdivision two, Changjiang River (Yangtze River) Estuary type, branched type, partially mixed, sediment from both sea and land; 3) Zhujiang River Estuary type, network type, partially mixed, sediment primarily from the land; and 4) Huanghe River (Yellow River), wandering type, highly stratified, sediment from the land. The different classifications of estuaries are described in terms of the ratio of mean flood tidal discharge to the mean river discharge into the sea (QR), and the ratio of the rate of the mean flood tidal sediment transportation to the rate of the mean river sediment transportation (SR). The tidal range and plane feature of an estuary are the primary classification indexes when QR and SR are unknown. The classification system has been satisfactorily applied to foreign rivers. Descriptors: *Cycling nutrients, *Marine sediments, *Phosphorus, *Sediment chemistry, *Taiwan, Aluminum, Copper, Hydrogen ion concentration, Indicators, Iron, Organic carbon, Taiwan Straits, Water quality, Zinc.

The distribution of phosphorus species and their concentrations in sediments from middle and northern parts of Taiwan Strait are presented. In the area surveyed, the concentration of phosphorus bound up in calcium-based matrices (Pca) makes up 90% of the total content of inorganic phosphorus (Pinorg). The level of Pca concentration is closely related to hydrodynamics, sea water temperature, and pH values, as well as others. The level of phosphorus in aluminum-based matrices (Pal) and the level of phosphorus in iron-based matrices (Pfe) is positively correlated with the levels of organic carbon, copper, and zinc. Pal and Pfe could also be used as an indicator of pollution in the marine environment. The level of soluble phosphorus is correlated with environmental oxidation-reduction, and it increases in reductive condition. (Author's abstract)

TWO-DIMENSIONAL NUMERICAL CALCULATION OF RESIDUAL CURRENT AND SALINITY AT THE CHANGJIANG RIVER ESTUARY (IN CHINESE).
Academia Sinica, Qingdao (China). Inst. of Oceanology.
K. J. Yu.
Oceanologia et Limnologia Sinica (Hai Yang Yu Hu Chao) HYHCAG, Vol. 21, No. 1, p 92-112, January 1990. 6 fig, 5 ref, 4 plates. English summary.

Descriptors: *China, *Estuaries, *Mathematical models, *Salinity, *Yangtze River, Changjiang River, Model studies, Water currents, Wind-driven currents.

The distribution of residual current and salinity in the Changjiang River (Yangtze River) estuary were compared for summer and winter by using a finite-difference method based on two-dimensional nonlinear equations of motion and salinity diffusion equations. The results show that the residual currents flow northeastward because of the influence of south winds in summer, but, in winter, they flow southwestward or southeastward because of the influence of the north wind. The salinity distribution corresponds to that of the residual currents. The salt tongue tends to be northeastward in summer, but southeastward in winter. The distributions of equal-salinity lines outside of the Changjiang River estuary were usually westward as a result of less discharge during the winter season. The analyses of residual currents and salinity were used to predict the possible effects of the Three Gorges project. (Author's abstract)

Bacterioplankton development is mainly dependent on the release of dissolved organic matter by phytoplankton and is expected in aquatic systems receiving major inputs of allochthonous organic matter. A distinct delay is observed in the response of bacteria to phytoplankton development, both during spring bloom in temperate marine systems and during the summer months in the Antarctic ecosystem (about 10 d in the North Sea, about 1 mo in Antarctica). Use of mathematical simulation of bacterial dynamics showed that such delays cannot be explained if phytoplankton exudation of low molecular weight substrates was the dominant process supplying dissolved organic matter to bacteria. Instead, these delays are correctly simulated assuming that the major source of organic substrates used for bacterial growth consists in the release of macromolecular compounds by post mortem lysis of algal cells. The planktonic ciliate community was investigated during field studies and enclosure experiments in the shallow eutrophic Darss-Zingst estuary (southern Baltic). The functional groups of ciliates were separated according to their main food items known from literature and from observations. In response to temporal changes in the production of bacteria and phytoplankton, changes in the composition of the ciliate community appeared. Algivores dominated during the spring bloom and in early summer and early autumn, corresponding to the pulses of small phytoflagellates and green algae, respectively. Bactivorous ciliates were of the highest importance during summer and autumn. Estimates of the feeding rates of functional groups revealed no significant impact of algivores but bactivores should be able to consume one third of annual bacterial production and can control bacterial production during certain periods. At high concentrations of ciliates, their density seemed to be regulated within the pelagic ciliate community itself by the impact of omnivores. Nutrient loading into enclosures during summer did not lead to considerable changes in ciliate community. The most important function of pelagic ciliates within the matter flux of this estuarine community seems to be the mineralization of bacterial production. (Author's abstract)

S. L. Coles, and J. C. McCain.
Marine Environmental Research MERSDW, Vol. 29, No. 4, p 289-315, 1990. 4 fig, 9 tab, 39 ref.

Descriptors: *Benthic environment, *Benthic fauna, *Coastal environment, *Coasts, *Species diversity, *Water pollution effects, Fate of pollutants, Hydrocarbons, Persian Gulf, Petroleum products, Population density, Salinity, Sea grasses, Sediments.

Species composition and abundances of benthic organisms >0.5 mm in size were determined in seagrass and sand/silt substrata along the Saudi Arabian Gulf coastline. Synoptic measurements were made of environmental and pollution-related parameters. Numbers of species and individuals were significantly greater in seagrass than in sand/silt substrata, indicating that the finer grained sediments of the seagrass areas support more diverse and abundant benthic communities. In both seagrass and sand/silt, abundances of species and individuals decrease significantly with increasing salinity, resulting in substantially reduced benthic communities in the Gulf of Salwah at the southern extent of the western Gulf where salinities average up to 56.5 ppt. In contrast, biomass of the total benthos in the sand/silt substratum increases significantly with salinity. All pollution-related parameters tested indicated relatively low concentrations in sediments. The only significant relationship found with the benthos was an increase in numbers of individuals with sediment petroleum hydrocarbons, resulting in significantly lower species diversities in areas of higher sediment petroleum. The most abundant organism in the area increases significantly with sediment petroleum hydrocarbons within the relatively low concentrations that do occur, indicating that this species is primarily responsible for the observed relationship between petroleum hydrocarbons, numbers of individuals and species diversity. Granulometric parameters, benthic biomasses of living organic matter, and oxygen and nitrogen fluxes at the water-sediment interface were investigated on triplicate samples, or in dark experiments, at 12 stations in the lagoon in SW New Caledonia. Analysis of functional characteristics of 3 bottom types revealed significant differences in the benthic food-webs. Onshore muddy bottoms had the lowest respiration, related to the lowest adenotriphosphate (ATP) pool and meiofauna density, in spite of high organic and pigment content. Near-reef white-sand bottoms were a sink for dissolved organic nitrogen (DON), exported no significant dissolved inorganic nitrogen (DIN), and supported the highest living biomass (ATP) via meiofauna and active microphytes. Intermediate grey-sand bottoms had the highest respiration, related to macrophyte cover and to a lesser extent to larger macrobenthos biomass, and were a source of nutrients for the water-column (DIN and DON). Partitioning of benthic biomass was investigated using non-linear multiple regression. Oxygen consumption was mainly related to ATP content, considered as representative of microfauna and meiofauna biomass, then to macrophyte biomass and to a lesser extent to macrofauna biomass. Pigment content did not improve the relationship. Depletion of inorganic nitrogen efflux, when compared to high respiration rates, increased from muddy bottoms to white-sand bottoms. Organic nitrogen (DON) exchanges were an order of magnitude greater than DIN exchanges indicating a considerable nitrogen demand in the sediment. (Author's abstract)

Descriptors: *British Columbia, *Channels, *Estuaries, *Rivers, *Sedimentation, *Shoals, *Tidal effects, *Tidal hydraulics, Regression models, Saline water intrusion, Statistical analysis.

Salinity and current surveys in the Main Channel of the Fraser River estuary, British Columbia, show that a well-defined salt-wedge intrusion migrates along the channel. Bivariate statistical analyses reveal that when discharge is nearly constant, the position of the salt-wedge is controlled by tidal height. Multivariate analyses of data with large ranges in discharge and tidal height indicate that intrusion location is a function of both discharge and tides. Multiple regression models were derived to predict salt-wedge position from river discharge and tidal height, for combined high and low tides, and for high tides and low tides separately. The high-tide model is the most precise, followed by the combined and then the low-tide models. The lower precision for the combined and low-tide models is probably due to the difficulty in accurately locating the salt-wedge tip at low tide. An analysis of channel bathymetric surveys and dredging records and application of the low-tide regression model reveals that the low-tide position of the salt-wedge is responsible for channel shoaling near the river mouth at Sand Heads. Shoaling produces a navigation hazard and is linked to submarine slope failures. (Author's abstract)

Metal contamination of estuarine sediments is an increasing problem in Florida, and elsewhere, as urbanization extends into previously undeveloped areas. Effective estuarine management practices require scientifically valid tools to assess the extent of estuarine contamination. Interpretation of anthropogenic metal contributions has been hampered by the fact that natural metal concentrations in sediments vary by orders of magnitude in different sediments. Normalization of metal concentrations to a reference element, aluminum, appears to be a promising method for comparing estuarine sediment metal concentrations on a regional basis. The description is presented of an interpretive method based on the relationship between sediment metals and aluminum, derived from statewide data on natural estuarine sediments in Florida. Examples from the Miami River and Biscayne Bay show how this method can be used to interpret metal concentrations. This interpretive tool provides a simple method for evaluating sediment metal data and allows results of sediment chemical analyses to be used for a variety of environmental information needs including: (1) distinguishing natural versus enriched metal concentrations in estuarine sediments; (2) comparing metal concentrations within an estuary; (3) comparing results from different estuaries; (4) tracking the spatial influence of a known pollution source; (5) monitoring temporal trends in metal concentrations; (6) examining data

Estuaries ESTUDO, Vol. 13, No. 3, p 236-249, September 1990. 12 fig, 5 tab, 31 ref. EPA Contract No. 68-03-3319.

Descriptors: *Chesapeake Bay, *Destratification, *Estuaries, *Mixing, *Model studies, *Wind-driven currents, Bays, Oxygen, Salinity, Tides, Turbulence, Vertical distribution.

It has been observed that storms in early fall can result in top to bottom mixing of the Chesapeake Bay. A three-dimensional, time dependent circulation model was used to examine this destratification process for September 1983, for which extensive current and hydrographic data are available. The model bay is forced at the surface by observed hourly winds, at the ocean boundary by observed hourly surface and bottom salinities and sea level fluctuations, and at the head by observed daily discharges for a 28-d period. A second-moment, turbulence-closure submodel, with no adjustments from previous applications to its requisite coefficients, was used to calculate the vertical turbulence mixing coefficients. Comparisons with data inside the model domain indicate relative errors of 7% to 14% for sea level, 7% to 35% for current, and 11% to 21% for salinity. The tidal portion of the spectrum is modeled better than the subtidal portion. The model is used to examine both the mechanisms of wind mixing and the temporal and spatial distribution of vertical mixing within the estuary. Wind-driven internal shear is shown to be a more effective mechanism of inducing destratification than turbulence generated at the surface. The model is also used to show that the vertical temperature inversion which occurs in the fall does not effect the timing of the destratification as much as its completeness. The distribution of mid-depth vertical mixing shows highly variable values in the mid-bay region, where wind induced mixing is dominant. This suggests that the source of oxygen to mid-bay bottom waters is similarly variable. Vertical turbulence mixing coefficients of .001 sq cm/s (background) to 1000 sq cm/s were needed to simulate the September period, indicating the need for time-variable mixing in models of dissolved and suspended estuarine constituents. W. J. Wiseman, E. M. Swenson, and J. Power.
Estuaries ESTUDO, Vol. 13, No. 3, p 265-271, September 1990. 5 fig, 3 tab, 13 ref. US Minerals Management Service Contract No. 14-12-0001-3052.

Descriptors: *Estuaries, *Louisiana, *Salinity, Analysis of variance, Bayou Lafourche, Mississippi River, Statistical analysis, Time series analysis.

Nonparametric tests for the presence of a trend in the time series of various salinity statistics were performed. Analysis of existing salinity time series from coastal Louisiana show that statistically significantly trends in mean salinity, salinity variance, and maximum salinity exist. These trends are of both signs, with no apparent large scale spatial pattern. Within individual estuaries, important trends have been identified; for example, increasing salinities within Bayou Lafourche. Linear estimates of the trend magnitudes suggest that the resultant changes in mean salinity, salinity variance, and maximum salinity have generally been small. The magnitudes of the predicted changes in mean salinity are generally small enough to be nondetrimental to the adjacent marsh lands. In a few locations, trends in the salinity regime are large and major changes in marsh vegetation have been observed. Natural variability in these systems, principally due to Mississippi River runoff and local climatology, are high and may hide weak trends. Nevertheless, extensive coastal degradation and land loss have been documented over time periods of the same order as the data records. If this were caused by a trend in the salinity regime, the present analysis should have identified the trend. (Lantz-PTT)

RELATIONSHIPS BETWEEN WETLAND FRAGMENTATION AND RECENT HYDROLOGIC CHANGES IN A DELTAIC COAST.
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
R. E. Turner, and Y. S. Rao.
Estuaries ESTUDO, Vol. 13, No. 3, p 272-281, September 1990. 8 fig, 15 ref.

Descriptors: *Canals, *Hydrological regime, *Spoil banks, *Wetlands, Erosion, Estuaries, Gulf of Mexico, Ponds, Sediment transport.

Patterns in coastal wetland loss in the northern Gulf of Mexico were examined using aerial imagery from 1955-56 and 1978. Five qualitative types of wetland changes are evident: (1) spoil-bank parallel pond formation, (2) pond formation with apparent random distribution for the smallest ponds, but very clumped distribution for larger ponds, (3) semi-, or complete impoundments resulting in open water formation, (4) cutting off of stream channels upstream of where a spoil bank crosses a natural channel, and (5) erosion at the land water interface. Only ponds < 20 ha formed and disappeared in the interval, and it is clear that wetland breakup, not erosion at the pond-lake edge, is the dominant form of wetland to open water conversion. Canals and their spoil banks are spatially related to wetland-to-water conversion which is evident up to 2 km away from those man-made features. The indirect impacts of canals and spoil banks vary regionally, for example, with sediment compaction rates that increase with increasing sediment deposition. These results are consistent with the hypothesis that canals and spoil banks are a major factor driving wetland loss rates because they change wetland hydrology. (Author's abstract)

COMPARISON OF PHYTOPLANKTON ASSEMBLAGES AND ENVIRONMENTAL RELATIONSHIPS IN THREE ESTUARINE RIVERS OF THE LOWER CHESAPEAKE BAY.
Old Dominion Univ., Norfolk, VA. Dept. of Biological Sciences.
H. G. Marshall, and R. W. Alden.
Estuaries ESTUDO, Vol. 13, No. 3, p 287-300, September 1990. 13 fig, 4 tab, 31 ref.

Descriptors: *Estuarine environment, *James River, *Phytoplankton, Algal blooms, Chesapeake Bay, Nitrogen, Phosphorus, Population dynamics, Rappahannock River, Seasonal variation, York River.

A 16-month data set of phytoplankton assemblages and environmental parameters were studied in the lower James, York (-Pamunkey), and Rappahonnock rivers using several exploratory statistical approaches. Based on species composition and river station relationships, three site groups were established and subsequently identified as predominantly tidal fresh, oligo-mesohaline, and mesohaline sites. Phytoplankton assemblages within these rivers were influenced and subsequently augmented by the onset of the spring freshet which was different in 1986 and 1987. Five temporal assemblages of phytoplankters were also identified and designed into seasonal groupings of spring 1986, summer-fall, summer-winter, fall-winter, and winter-spring 1987. Discriminant analysis (MANOVA) evaluations were made for water quality parameters to site and seasonal phytoplankton assemblages. Moving downstream along the oligohaline-mesohaline gradient, the nitrogen and phosphorous levels decreased and the phytoplankton composition was more similar at several corresponding site locations in the different rivers than at stations relatively close to each other in the same river. Within these data sets, approximately 58% of the explained variance was associated with site (spatial) effects, 30% with temporal effects, and 12% with site-temporal interactions. A transition from dominant bloom-producing freshwater diatoms to estuarine species occurs from the tidally influenced freshwater zone downstream. This change may be rapid as the decline of Skeletonema potamos, or gradual, as with Cyclotella striata and Cyclotella meneghiania. These are replaced downstream by Skeletonema costatum, Cyclotella caspis, and Leptocylindrus minimus as dominant species. (Author's abstract)

COMPARISON OF THE DIETS OF GULF KILLIFISH, FUNDULUS GRANDIS BAIRD AND GIRARD, ENTERING AND LEAVING A MISSISSIPPI BRACKISH MARSH.
Louisiana Universities Marine Consortium, Chauvin.
L. P. Rozas, and M. W. LaSalle.
Estuaries ESTUDO, Vol. 13, No. 3, p 332-336, September 1990. 1 fig, 3 tab, 27 ref.

Descriptors: *Biological studies, *Fish diets, *Killifish, *Marshes, *Tidal marshes, Amphipods, Comparison studies, Crabs, Ecosystems, Estuaries, Estuarine environment, Fish food, Polychaetes, Tides.

An examination was conducted of the diets of Gulf Killifish, Fundulus grandis Baird and Girard, collected monthly from March through July 1988 with unbaited minnow traps during two sampling periods: (1) on flood tides before they reached the marsh surface, and (2) on ebb tides as they left the marsh. Thirty-five prey taxa, plant parts, and detritus were identified from the stomach contents of 110 Gulf Killifish (mean SL = 55 mm, range = 30-82 mm). Fiddler crabs, Uca longisignalis Salmon and Atsaides; amphipods, mostly Corophium louisianum Shoemaker; tanaidaceans, Hargeria rapax (Harger); and hydrobiids, Littoridinops palustris Thompson, were their most important prey. Killifish diets differed both quantitatively

and qualitatively relative to the habitat in which they were feeding. Fiddler crabs and polychaetes were consumed more frequently and in greater numbers in the intertidal zone, whereas more amphipods were eaten by killifish feeding in subtidal and low intertidal areas. Gulf Killifish consumed greater volume of food when they had access to the marsh surface than when they were confined to subtidal areas. (Author's abstract)

EFFECT OF TIDAL FLOODING ON MORTALITY OF JUVENILE MUSKRATS.
Louisiana State Univ., Baton Rouge. School of Forestry and Wildlife Management.
Q. J. Kinler, R. H. Chabreck, N. W. Kinler, and R. G. Linscombe.
Estuaries ESTUDO, Vol. 13, No. 3, p 337-340, September 1990. 2 fig, 26 ref.

Descriptors: *Brackish water, *Ecological effects, *Marshes, *Mortality, *Muskrats, *Tidal floods, Population dynamics, Sea level, Seasonal variation, Water level.

An investigation was conducted in the brackish marsh in Louisiana by examining 50 muskrat lodges each month from July 1984 to June 1985 and tidal data over a 19 year period. Tide levels increased at a rate of 1.58 cm/yr during the 19-yr period prior to the study, and during the study, nest chambers in muskrat lodges were flooded on 43 d. Seventy-seven captured litters averaged 2.2 +/-0.3 young per litter. Older litters were less common than younger litters, but the number of young per litter did not differ among 5-d age classes, suggesting that mortality factors usually affected entire litters. The frequency of tidal flooding prior to the opening of lodges each month was associated negatively with the number of litters and number of young per litter. If marsh subsidence and sea level rise continue, tidal flooding will become more prevalent and litter mortality will likely increase. (Author's abstract)
W91-01910

FOOD HABITS OF TWO LARVAL FLIES (DOLICHOPODIDAE: DIPTERA) IN TWO GULF COAST OLIGOHALINE TIDAL MARSHES.
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Lab.
M. W. LaSalle, and T. D. Bishop.
Estuaries ESTUDO, Vol. 13, No. 3, p 341-348, September 1990. 2 fig, 3 tab, 42 ref.

Descriptors: *Ecosystems, *Flies, *Food habits, *Tidal marshes, *Wetlands, Energy, Estuarine environment, Food chains, Marshes, Nematodes, Oligochaetes, Polychaetes.

Food habits were analyzed from two species of dolichopodid fly larvae through monthly collections taken between June 1979 and May 1980. Larvae of Pelastonerurus abbreviatus Loew and Thinophilus frontalis Van Duzee, taken from a Juncus roemerianus Scheele dominated marsh, fed predominantly on oligochaetes and nematodes. Pelastoneurus abbreviatus, collected in a nearby Spartina cynosuroides (L.) Roth march, also fed on oligochaetes but consumed more polychaetes than nematodes. By being predators and prey in turn, these larvae serve in the transfer of energy between benthic, aquatic, and terrestrial components of the marsh system. (Author's abstract)

PHOSPHATE LIMITATION IN ESTUARINE AND COASTAL WATERS OF CHINA.
British Columbia Univ., Vancouver. Dept. of Botany.
P. J. Harrison, M. H. Hu, Y. P. Yang, and X. Lu.
Journal of Experimental Marine Biology and Ecology JEMBAM, Vol. 140, No. 1/2, p 79-87, July 31, 1990. 4 fig, 38 ref.

Descriptors: *China, *Limiting nutrients, *Nitrates, *Phosphorus, *Phytoplankton, *Primary productivity, Coastal areas.

Mesocosm experiments conducted off the southern coast of mainland China indicate that phytoplankton growth is limited by phosphorus, rather than nitrogen. In April, when natural seawater was enclosed in mesocosms, phosphorus always reached undetectable concentrations several days before inorganic nitrogen. This was not surprising since the initial N:P (by atoms) in the seawater at the start of the experiment was aproximately 80:1, indicating about a five-fold excess nitrogen over phosphorus. Bioassay experiments also indicated P-limited phytoplankton growth for seawater in Xiamen Bay. Several other estuaries along the coast of China have N:P ratios ranging from 30:1 to greater than 80:1. The large rivers of China have high nutrient loads with nitrogen in great excess over phosphorus (e.g., N:P up to 150:1). As a consequence of these large riverine inputs, vast areas along the coast of China are P-limited for primary production. (Author's abstract)

EPA's Chesapeake Bay Program grant R8059322010.

Descriptors: *Chesapeake Bay, *Estuaries, *Estuarine fisheries, Ecological distribution, Fish behavior, Fish diets, Fish populations, Macrophytes, Predation.

Fish communities and other ecological variables were sampled for 6 mo (May to October) in successive years (1979, 1980) at vegetated and non-vegetated areas in 2 distinctively different littoral zones (an open bay and a protected cove) of mid-salinity Chesapeake Bay. Fish abundance, biomass and species richness were higher in vegetated areas at both sites, and were significantly correlated with macrophyte biomass. Diel patterns of fish abundance varied, but highest catches generally occurred at dusk or at night. At one sampling site, fish assemblages were dominated by smaller individuals in the vegetated area, suggesting an attraction of juveniles to macrophyte beds for food or refuge from predation. Larger piscivorous fish, which were also caught in greater numbers in vegetated areas, may have been attracted there by higher densities of forage fish. At the cove site, the biomass of Paleomonetes sp. was comparable to that of the fish community towards the end of the plant growing season. Benthic infauna were also more abundant in vegetated areas at both sites, and stomach analyses indicated these organisms to be the dominant food resources for common fishes. Diets were generally non-selective in non-vegetated areas while highly selective for epiphytic fauna in macrophyte beds. Fish stomachs were also significantly fuller in vegetated areas, indicating generally greater feeding success. Fish production varied among major species but was higher overall at vegetated areas, following the seasonal patterns of primary production. Most of the differences in fish production between areas were attributable to higher instantaneous growth rates rather than higher biomass. It appears that the greater abundance and species richness of fish assemblages in vegetated areas of this region of the Chesapeake Bay resulted from the attractiveness of these habitats as rich sources of preferred foods. SEASONAL AND TIDAL ABUNDANCE OF CRAB LARVAE IN A TROPICAL MANGROVE SYSTEM, GULF OF NICOYA, COSTA RICA.
Delaware Univ., Newark. Coll. of Marine Studies.
A. I. Dittel, and C. E. Epifanio.
Marine Ecology Progress Series MESEDT, Vol. 65, No. 1, p 25-34, July 19, 1990. 4 fig, 6 tab, 63 ref.
NSF grant INT-8613439 and Universidad de Costa Rica.

Descriptors: *Costa Rica, *Crabs, *Estuaries, *Gulf of Nicoya, *Mangrove swamps, *Tides, *Wetlands, Life cycles, Population dynamics, Seasonal variation, Tidal currents.

Crab larvae were collected from a platform moored in the mouth of a mangrove tidal creek in the Gulf of Nicoya on the Pacific coast of Costa Rica, Central America. Eight observation periods encompassed both spring and neap tides and covered all seasons of the year. During each observation period, samples were collected every 2 h over 5 consecutive tidal cycles. Samples were collected from a depth of 1 m with a gasoline-powered impellar pump; total volume of each sample was 10 to 12 cu meters cubed. The gross taxonomic composition of the observed larval assemblage was similar to that seen in temperate estuaries along the Atlantic coast of North America. Larvae of Uca spp., Grapsidae, Xanthidae and commensal crabs such as Pinnotheres spp. were the most common forms in excess of 1000 larvae per cu meters. In contrast to temperate estuaries, spawning occurred year-round, but individual taxa showed distinct seasonality. As in temperate estuaries, spawning in the tidal creek was also influenced by lunar cycles and larvae of several taxa showed tidally rhythmic changes in abundance. Zoea I of Uca spp., Grapsidae, Xanthidae, Pinnotheres spp. and Petrolisthes spp. were significantly more abundant during ebb tides suggesting that these larvae were spawned in the creek and exported to the open Gulf. Advanced zoea and megolopae appeared to take advantage of nocturnal flood tides to be recruited back into the estuary. Export of early stages did not occurr in all taxa. Abundance of early zoeal stages of Pinnixa spp. was not affected by tidal phase suggesting that early stages were not exported from the tidal creek. (Author's abstract)

NATURAL ABUNDANCE OF 15N IN PARTICULATE NITROGEN AND ZOOPLANKTON IN THE CHESAPEAKE BAY.
Harvard Univ., Cambridge, MA. Museum of Comparative Zoology.
J. P. Montoya, S. G. Horrigan, and J. J. McCarthy.
Marine Ecology Progress Series MESEDT, Vol. 65, No. 1, p 35-61, July 19, 1990. 7 fig, 13 tab, 36 ref. NSF grants OCE-82-14932 and OCE-86-14199.

Descriptors: *Chesapeake Bay, *Estuaries, *Estuarine environment, *Nitrogen, *Zooplankton, Inorganic nitrogen, Particulate nitrogen, Phytoplankton, Seasonal variation, Trophic level.

Samples of dissolved inorganic nitrogen (DIN), particulate nitrogen (PN), and several species of zooplankton were collected at a series of stations in the main channel of the Chesapeake Bay, during cruises in spring and fall 1984. The spatial and temporal variation in the natural abundance of N15 (delta N15) in each of these pools, in combination with measurements of the concentrations of DIN, PN, plant pigments, and the rates of biologically-mediated transformations of nitrogen, provide a number of insights into the dynamics of the nitrogen cycle in the Chesapeake Bay. The overall gradient of DIN concentrations along the axis of the Bay appears to be less important than local processes in determining the distribution of N15 in PN. The relationship between delta N15 of PN and delta N15 of dissolved pools indicated that phytoplankton uptake was the dominant process acting on DIN in Spring, but that microbially-mediated transformations of nitrogen dominated in the fall. During both seasons, delta N15 of particulate and dissolved pools suggested that phytoplankton consume both NO3(-) and NH4+ roughly in proportion to concentration. The delta N15 of the zooplankton species sampled generally increased with trophic level. The spatial variability of delta N15 of all 3 trophic levels (PN, copepods, and ctenophores) was greater in spring than in all, suggesting that phytoplankton and zooplankton have a greater direct influence on the estuarine nitrogen cycle during spring. A comparison of the 2 transects conducted on each cruise demonstrates that delta 015 nitrogen of the PN and A. tonsa, but not that of M. Leidyi, can change markedly on a time scale of roughly a week. Such changes clearly indicate that repeated sampling may be essential in studies of the natural abundance of N15 in dynamic planktonic systems such as that in the Chesapeake Bay. (Author's abstract)

PELAGIC METABOLISM IN EUTROPHIC WATERS DURING A LATE SUMMER PERIOD.
Copenhagen Univ., Hilleroed (Denmark). Det Ferskvands-Biologiske Lab.
K. Sand-Jensen, L. M. Jensen, S. Marcher, and M. Hansen.
Marine Ecology Progress Series MESEDT, Vol. 65, No. 1, p 63-72, July 19, 1990. 2 fig, 5 tab, 49 ref.

Descriptors: *Bacteria, *Denmark, *Eutrophic fjords, *Fjords, *Phytoplankton, *Primary productivity, Biomass, Eutrophication, Metabolism, Organic matter, Respiration.

Phytoplankton and bacterial biomass were measured at weekly intervals during summer in water samples from 2 sites in the shallow, eutrophic Roskilde Fjord, Denmark. In addition O2-uptake on unfiltered water and size fractions < 100 micrometers and < 1 micrometers was measured. Phytoplankton gross production in the water column was 6.2 g O2/sq m/d at Stn 1 and was balanced by pelagic community respiration and sediment respiration. Phytoplankton gross respiration was temporarily exceeded by pelagic community respiration plus sediment respiration at Stn 2 where there is additional production by littoral plant communities. Phytoplankton and bacteria together accounted for 72 to 85% of community respiration (Rc) and zooplankton for the remainder. Phytoplankton respired a large proportion (ca 30%) of their gross production and were apparently mainly grazed by benthic suspension feeders. Phytoplankton dominated pelagic respiration (50% of Rc) at Stn 1, which has the most phytoplankton, while bacteria dominated (44% of Rc) at Stn 2. The relatively larger respiratory activity of bacteria at Stn 2 is ascribed to an additional supply of organic matter from littoral plant communities and frequent sediment suspension. The importance of bacteria in the pelagic food web was supported by other findings. Bacterial biomass approached phytoplankton carbon biomass at Stn 2 and bacterial net production and respiration were linearly related in the bacterial size-fraction (<1 micrometer) with a bacterial growth yield of 47%. It is argued that the conversion factors applied to calculate bacterial net production and the mean growth yield attained are reasonable values considering the other measurements of pelagic carbon pools and processes. DIEL VARIATIONS IN PHOTOSYNTHETIC ACTIVITY OF SUMMER PHYTOPLANKTON IN LINDASPOLLENE, WESTERN NORWAY.
Norsk Inst. for Vannforskning, Oslo.
S. R. Erga, and H. R. Skjoldal.
Marine Ecology Progress Series MESEDT, Vol. 65, No. 1, p 73-85, July 19, 1990. 9 fig, 2 tab, 90 ref. Norwegian Marine Pollution Research and Monitoring Program.

Descriptors: *Diurnal variation, *Fjords, *Norway, *Photosynthesis, *Phytoplankton, Correlation analysis, Depth, Light, Lindaspollene, Nutrients, Primary productivity.

Diel patterns in photosynthesis of natural phytoplankton were studied during a 5 d period during midsummer in Lindaspollene, a land-locked fjord of western Norway. Samples were taken from depths of 0.5, 5, 10 and 21 m at 3 to 4 h intervals. The natural light:dark cycle was 19:5 h. The coccolithophorid Emiliania huxleyi and ultraplankton (<5 micrometer) flagellates were predominant in the upper 10 m, while diatoms and silicoflagellates were predominant at 21 m. No clear diel pattern was seen in the variations of chlorophyll a and cell numbers. The photosynthesis vs. light relationship (P-I) was studied at 0.5 and 10 m, and the parameters PBmax (specific production rate at optimal light intensity) alpha B (initial slope of the light saturation curve) and Ik (irradiance at which the prolongation of the initial and horizontal parts of the parts of the photosynthesis curve intersect) showed pronounced diel rhythms. Maximum and minimum values of alpha B and PBmax differed by a factor of 3 to 4 and occurred in the morning and evening periods, respectively. These parameters were linearly correlated at both 0.5 and 10 m, indicating a phased diel periodicity. Ik showed a clear diel variation at 0.5 m with minimum values at night, whereas no persistant diel rhythm could be seen at 10 m. PB max and Ik were correlated at 0.5 m but not at 10 m, while Ik and alpha B were weakly correlated at both 0.5 and 10 m. In vivo florescence per unit chlorophyll a showed a diel variation pattern that was the opposite to that of PBmax and alpha B. The results indicate that an endogenous rhythm is regulating the diel oscillations in photosynthesis. This endogenous mechanism is possibly entrained by environmental signals such as cycles in nutrient availability and light conditions. (Author's abstract)

INCORPORATION OF THYMIDINE, ADENINE AND LEUCINE INTO NATURAL BACTERIAL ASSEMBLAGES.
Vandkvalitetsinstitutet, Hoersholm (Denmark).
B. Riemann, R. T. Bell, and N. O. G. Jorgensen.
Marine Ecology Progress Series MESEDT, Vol. 65, No. 1, p 87-94, July 19, 1990. 2 fig, 3 tab, 51 ref. Carlsburg Foundation grant 87-0358/40 and Danish National Science Research Council grant 41-0003.

Descriptors: *Adenine, *Amino acids, *Bacterial physiology, *Deoxyribonucleic acid, *Leucine, *Primary production, *Thymidine, Culture techniques, Growth rates, Incorporation rates.

Incorporation of H3-thymidine and H3-adenine into DNA and H3-leucine into protein were measured in diluted batch cultures of natural asssemblages of coastal marine and freshwater bacteria. Incorporation rates of DNA and protein synthesis were compared with changes in bacterial DNA and carbon pools. Incorporation rates of all three substances peaked before maximum cell densities were reached. H3-leucine incorporation was somewhat higher than both H3-thymidine and H3-adenineincorporation during early exponential and stationary growth periods. The molar ratio of incorporated H-3-adenine and H3-thymidine was 1:1 in freshwater and 3:1 in seawater cultures, and the cellular DNA content ranged from 2 to 4 fg per cell, corresponding to an average of 5.5% of cell carbon. DNA contents predicted from incorporation rates of adenine were 66 to 86% and of thymidine 28 to 77% of the measured DNA content. Conversion factors to derive bacterial cell numbers were 0.85 to 1.75 times 10 to the 18th power cells per mol thymidine incorporated and 0.47 to 0.92 times 10 to the 18th power cells per mol adenine incorporated. Carbon production predicted from incorporation rates of H3-thymidine, H3-adenine or H3-leucine differed by at most 31% from measured carbon production, suggesting that all three methods were applicable to determine growth rates and carbon production in the batch cultures. UNUSUAL MARINE ECOSYSTEM IN THE FLOODED CRATER OF USHISHER VOLCANO.
Akademiya Nauk SSSR, Vladivostok. Inst. Biologii Morya.
A. V. Zhirmunsky, and V. G. Tarasov.
Marine Ecology Progress Series MESEDT, Vol. 65, No. 1, p 95-102, July 19, 1990. 9 fig, 22 ref.

Descriptors: *Heavy metals, *Marine biology, *Sulfur compounds, *Volcanoes, Algae, Bacteria, Chemical properties, Macroinvertebrates, Photosynthesis, Physiology, Usishe volcano.

A marine ecosystem in Kraternaya Bight (Yankich Island, Kurile Islands) which has arisen and is functioning under the influence of gaso-hydrothermal vents of the Ushisher volcano was studied. The concentrations of reduced sulfur compounds and a number of metals in the vents are 2 to 3 orders of magnitude higher than in seawater around the island. Together with the photosynthesis of algae, chemosynthetic bacteria play an essential part in primary production. Extreme chemical conditions in the outlets of vents have left a mark on the composition of communities and in peculiarities of certain species. Organisms (some of the dominant species) which have colonized Kraternaya Bight have changed in morphology and adapted to extreme conditions. They have essentially changed some of their biochemical characteristics: they have a high content of the cytochrom P-450, 5-aminolevulinate synthetase and high rate of the level oxidizing in the microsomal system. Concentrations of some metals are so high that ecosystems of Kraternaya Bight can be considered as a model of sea territory with a high degree of industrial pollution. At the request of the Institute of Marine Biology, a biological preserve in Kraternya Bight has been established. (Fleishman-PTT)

WINTER DISTRIBUTION OF NUTRIENTS IN THE SOUTHERN BIGHT OF THE NORTH SEA (1961-1978) AND IN ESTUARIES OF THE SCHELDT AND THE RHINE/MUESE.
Nederlands Inst. voor Onderzoek der Zee, Texel.
A. J. Van Bennekom, and F. J. Wetsteijn.
Netherlands Journal of Sea Research NJSRBA, Vol. 25, No. 1/2, p 75-87, May 1990. 14 fig, 2 tab, 36 ref.

Descriptors: *Nitrates, *North Sea, *Nutrient concentrations, *Phosphates, *Rhine/Meuse Estuary, *Scheldt Estuary, Phytoplankton, Seasonal distribution, Silica, Tracers, Wind-driven currents.

The winter distribution of nutrients in the eastern part of the Southern Bight is influenced by phytoplankton growth, always in February, sometimes in January. The Scheldt river has higher nutrient concentrations than the rivers Rhine and Seine. The waters of the Scheldt river plume are distinguished from those of the Seine and the Rhine/Meuse using disolved silica as a tracer. The extension of the Scheldt river plume was related to wind direction. The increase of inorganic nutrients from January 1961 to January 1978 in the northern part of the Southern Bight was related to the nutrient increase in the river Rhine. The increase in the Strait of Dover was related to discharges from the river Seine and the English coast. Only data outside the Scheldt river plume were selected for comparison. An increase of nutrient concentrations was measurable over the entire salinity range and was largest for phosphate (up to 3 times at low salinities), less for nitrate (about 1.5 times for all salinities) and hardly noticeable for silicic acid. Nitrate extrapolation to low salinity agreed with upstream river values, but phosphate extrapolation gave higher concentrations, probably due to discharges of phosphogypsum in estuaries. Netherlands Journal of Sea Research NJSRBA, Vol. 25, No. 1/2, p 131-142, May 1990. 3 fig, 1 tab, 53 ref.

Descriptors: *Coastal waters, *Diatoms, *Limiting nutrients, *North Sea, *Phytoplankton, Biomass, Carbon, Nitrogen, Phosphates, Silicates.

The vernal phytoplankton bloom was observed during cruises to the southeastern part of the North Sea in 1985 and 1986. Maximum phytoplankton biomass expressed as phytoplankton carbon was similar in both years. In 1985 the bloom was located in the less saline coastal water close to the North Frisian coast. Phytoplankton was dominated by Coscinodiscus concinnus and Thalassiosira nordenskioldü. In 1986, highest phytoplankton biomass was observed northwest of the island of Sylt, where Thalassiosira nordenskioldii was the dominant phytoplankton species. Within areas of high phytoplankton standing stock, concentrations of the inorganic dissolved nutrients phosphate and silicate had dropped to nearly undetectable concentrations, whereas both in 1985 and 1986 the water was still rich in organic nitrogen. This, as well as the high ratios of DIN:PO4 and DIN:Si(OH)4 (> 50) point to phosphate and silicate as potential limiting nutrients during the spring phytoplankton bloom. The ratios of total nitrogen (TN) to total phosphorous (TP) (> 30) indicate also that phosphorous might then be in short supply. Phosphate and silicate have to be considered as potentially limiting nutrients during the vernal plankton bloom in the coastal waters of the southeastern North Sea, with nitrogen being present in surplus at that time of year. However, in the more offshore areas nitrogen may be considered the potentially limiting element at the same time. (Author's abstract)

PRIMARY PRODUCTION AND NITROGEN ASSIMILATION IN THE NORTH SEA DURING JULY 1987.
Plymouth Marine Lab. (England).
N. J. P. Owens, E. M. S. Woodward, J. Aiken, I. E. Bellan, and A. P. Rees.
Netherlands Journal of Sea Research NJSRBA, Vol. 25, No. 1/2, p 143-154, May 1990. 7 fig, 30 ref.

Descriptors: *Coastal waters, *Denitrification, *Nitrogen, *North Sea, *Primary production, Ammonium, Carbon, Chlorophyll, Nutrient concentrations, Phytoplankton.

Surface water inorganic nutrient concentrations and concomitant rates of primary production (C-14) and nitrogen assimilation (N-15) were measured in the North Sea in July 1987. Primary production was investigated using size fractionation techniques. Three vertical profiles of primary production and nitrogen assimilation were also investigated. Much of the North Sea exhibed thermal stratification. Surface nutrient concentrations were low and chlorophyll concentrations typically <1 mg per meter cubed. More than 75% of the primary production was attributable to cells <5 micrometers in diameter. Ammonium assimilation accounted for most of the nitrogen assimilation. The water column was vertically well mixed in the coastal zones. Here, inorganic nitrogen concentrations were high with chlorophyll concentrations up to 10 per mg cubed, and organisms >5 micrometers in diameter accounted for most of the primary production. As in offshore regions, ammonium accounted for the major part of the nitrogen assimilated. A 115 km section obtained using an undulating oceanographic recorder showed that in certain regions of the North Sea physical features acted to increase the dependence of the phytoplankton on nitrate. (Author's abstract)

CHANGES IN SPATIAL DISTRIBUTION OF PRIMARY PRODUCTION, PHOTOSYNTHETIC PIGMENTS AND PHYTOPLANKTON SPECIES COMPOSITION DURING TWO SURVEYS IN THE GERMAN BIGHT.
Rijkswaterstaat, The Hague (Netherlands). Div. of Tidal Waters.
F. Colijn, L. Villerius, M. Rademaker, K. D. Hammer, and K. Eberlein.
Netherlands Journal of Sea Research NJSRBA, Vol. 25, No. 1/2, p 155-164, May 1990. 11 fig, 2 tab, 33 ref.

Descriptors: *Chlorophyll, *North Sea, *Phytoplankton, *Pigments, *Primary production, Diatoms, Flagellates, German Bight, Nutrients, Spatial distribution, Species composition.

A grid of 61 stations was sampled twice in the German Bight. At all stations dissolved nutrients (Si, P, N), fluorescence, temperature and salinity were measured along the vertical at surface, 5 m, 10 m, and 10 m intervals to the bottom. At selected stations, photosynthetic rates were measured with C-14 method (both surveys) and pigment with a HPLC method (first survey). Phytoplankton species composition was dominated by small diatoms, mainly Leptocylindrus minimus, flagellates, both dinoflagellates and choanoflagellates and near shore blooms of Phaeocystis pouchetü. Primary production and chlorophyll-a showed a linear correlation (r=0.90, n=23). Primary production showed highest rates along the North and East Frisian islands, where phytoplankton was dominated by Phaeocystis and Leptocylindrus. These coastal stations were completely mixed whereas a large part already showed stratification due to salinity and temperature. Thermocline and pycnocline were at about 10 m depth. No differences in oxygen content of surface or bottom waters were observed. Silicate and phosphate concentrations were very low whereas nitrogen still showed very high concentrations. Low hypolimnetic oxygen concentrations are only possible when transport of primary produced organic matter is transported to stratified regions later in summer. Rapid growth of blooms was observed within a weeks period. More primary production measurements in the German Bight should be done to allow for budget calculations of oxygen consumption below the thermocline. (Author's abstract)

SIMULATION MODEL OF WATER DEPTH IN MANGROVE BASIN FORESTS.
Collier Mosquito Control District, Naples, FL. S. A. Ritchie.
Journal of the American Mosquito Control Association JAMAET, Vol. 6, No. 2, p 213-222, June 1990. 6 fig, 1 tab, 10 ref.

Descriptors: *Computer models, *Hydrologic models, *Mangrove swamps, *Model studies, *Simulation, *Water depth, *Wetlands, Calibrations, Hydrologic cycle, Hydrologic data, Mosquitoes, Rainfall.

The ability to understand and predict short and long-term mosquito abundance is a key to effective control of Aedes taeniorhynchus (Wiedemann), the black salt marsh mosquito. To help satisfy these goals, a hydrological model simulating the water depth within mangrove basin forests was constructed and validated. Rainfall, water table, water depth and tide data collected from a red mangrove basin forest on Marco Island, FL, was used to estimate model parameters. These included the basin spillover height, evapotranspiration-infiltration rate and the functional relationship of water depth change to rainfall, tide and basin spillover. The model was constructed with LOTUS 123 and calibrated from staff gauge water depth records. The model proved accurate and adaptable. Water depths from the model and staff gauge were highly correlated (r = 0.98). Data from an adjacent black mangrove forest featuring complex wet-dry cycling were used to modify the model. After calibration, the model provided an accurate record of water depths at the site (r = 0.89). This model will provide water depths used in a model of Aedes taeniorhynchus population dynamics. Separation Science and Technology SSTEDS, Vol. 25, No. 3, p 309-321, 1990. 7 fig, 2 tab, 10 ref.

Descriptors: *Brines, *Desalination wastes, *Drinking water, *Evaporation, *Reclaimed water, Flash evaporation, Industrial plants, Magnesium chloride, Sodium chloride, Solubility, Specific gravity.

The recovery of a salt (in particular, magnesium chloride) from rejected brines of desalination plants through the simulation of a modified Multistage Flash (MSF) evaporation system was studied. Such a proposal is attractive for countries highly dependent on water desalination. Saudi Arabia and other Arab Gulf states are good examples. A basic assumption underlying this study (both Part I and Part II) is that desalination effluents contain only the two most abundant salts in seawater: sodium and magnesium chlorides. An equilibrium relationship describing the solubility of sodium chloride in aqueous solutions of magnesium chloride is developed. This generalized correlation is based on the solubility data available in the literature. The correlation is valid for the temperature range 15-200 C and for a concentration of magnesium chloride up to 30 g/100 g saturated solution. Calculations of the specific gravity and viscosity of highly concen-

trated brines are presented and then compared with experimental data. It is concluded that the solubility correlation is valid for predicting the solubility of sodium chloride in aqueous magnesium chloride solution for the indicated temperature and concentration ranges. An average deviation of less than 8% was calculated, except for a few points which probably had inherent experimental errors. For these specific points, the deviation was extremely high. CHARACTERIZATION OF DESALTING CONCENTRATES.
Rostek Services, Inc., Fort Myers, FL.
I. C. Watson.
Desalination DSLNAH, Vol. 78, No. 1, p 5-9, July 1990. 3 tab.

Descriptors: *Desalination wastes, *Membrane processes, *Reverse osmosis, *Waste characteristics, *Waste disposal, Chemical analysis, Desalination, Estimating, Florida, Heavy metals, Organic compounds.

With the recent rapid growth of desalting applications in Florida, the subject of desalting concentrate disposal has assumed a significant role. In order that the designer may realistically project expected concentrate characteristics, it is necessary to examine the various membrane processes involved. Typical compositions of concentrates produced from brackish water reverse osmosis, membrane softening and electrodialysis reversal methods are detailed. Use of the seawater reverse osmosis method may also be used in the future, due to its simple method of disposing concentrate by discharging it back into the sea. Desalting plant concentrate characteristics may be predicted with reasonable accuracy in the absence of actual test data. While software developed by the membrane manufacturers will predict the major ionic species, most of those components examined by the Florida Depart of Environmental Regulation will have to be derived in theory. Several rules of thumb are given for the estimation of heavy metals, organics, and hydrogen sulfide, and for calculating the concentration factor. (VerNooy-PTT)

HIGH RECOVERY REVERSE OSMOSIS.
Stone and Webster Engineering Corp., Fort Lauderdale, FL.
B. M. Watson.
Desalination DSLNAH, Vol. 78, No. 1, p 91-97, July 1990. 5 fig.

Descriptors: *Brines, *Desalination, *Desalination wastes, *Feedwater treatment, *Reverse osmosis, *Scaling, *Waste disposal, Liming, Pilot plants, Wastewater disposal.

The costs of transmission and disposal of reverse osmosis (RO) plant concentrates per unit of water production are directly related to brine volumes, which affect size of pipe, stripping towers, sedimentation basins, outfalls and/or injection wells, and any repumping required en route. These costs may be markedly reduced by increasing product recovery. As a means to minimize or eliminate brine disposal problems, high recovery RO must be accompanied by pre or post-treatment to avoid scale precipitation, almost entirely by calcium sulfate. All such methods, such as pretreatment by lime-soda softening, post-treatment by lime/lime-soda softening, and pretreatment by desulfation will add to water cost. However, rigorous comparison must be made with the costs and constraints of brine disposal at recoveries low enough not to require these treatments. Such examination is invariably and totally site-specific. Prior to detailed design of any large RO facility, it is always prudent to invest in a pilot plant testing program, whereby membrane performance under varying recovery and flux may be evaluated on the raw feed to be used at full scale. Because of the even tighter design limits imposed at high recovery, pilot tests of combined membrane and treatment processes are absolutely essential. (Author's abstract)

META-ANALYTIC REAPPRAISAL OF STATISTICAL RESULTS IN THE ENVIRONMENTAL SCIENCES: THE CASE OF A HYDROLOGICAL EFFECT OF CLOUD SEEDING.
Hebrew Univ. of Jerusalem (Israel). Inst. of Earth Sciences.
D. Sharon.
Journal of Applied Meteorology JAMOAX, Vol. 29, No. 5, p 390-395, 1990. 2 fig, 2 tab, 9 ref.

Descriptors: *Cloud seeding, *Data interpretation, *Hydrologic models, *Model studies, *Simulation analysis, *Statistical analysis, *Statistical methods, Experimental data, Israel, Meteorological data, Model testing, Streamflow forecasting.

A frequent problem in the statistical analysis of data in the environmental sciences is the synthesis of results obtained independently from various sets of data such as from different measuring points or from replicated experiments. Unlike their separate analysis, the sets' ultimate combined evaluation is often given in descriptive terms. The critical final stage of data synthesis is where meta-analysis is important. Meta-analysis offers a theoretical basis for combining outcomes from a number of independent data sets, or replicated experiments, into one integrated result. It also provides an integrated significance test. The meta-analysis approach was applied to a cloud seeding project in Israel to determine the hydrological effect on stream and spring flow. The effectiveness of this approach was illustrated by means of a series of mostly positive primary results, which, however, were lacking significance when subjected to separate t-tests. In the case of rainfall enhancement in Israel, the lack of significance in primary tests had previously been considered overriding, whereas the meta-analytic combination of results came out distinctly significant. PERSISTENCE OF SEEDING EFFECTS IN A WINTER OROGRAPHIC CLOUD SEEDED WITH SILVER IODIDE BURNED IN ACETONE.
Bureau of Reclamation, Auburn, CA.
T. Deshler, and D. W. Reynolds.
Journal of Applied Meteorology JAMOAX, Vol. 29, No. 6, p 477-488, 1990. 5 fig, 32 ref.

Descriptors: *Cloud liquid water, *Cloud seeding, *Meteorological data, *Orographic precipitation, *Silver iodide, Aircraft, Atmospheric circulation, Ice, Isotopic tracers.

A number of experiments have focused on determining the physical effects of cloud seeding. Measurements in a cloud chamber indicate that an AgI NH4I NH4CO4 mixture will produce detectable levels of ice crystals in clouds as warm as -6 C. Also the AgI is useful as a tracer since it can be measured with an ice nucleus counter. Seeding material was identified and tracked in a wintertime, fairly shallow, stratiform cloud over the central Sierra Nevada with the use of a research aircraft. The effects of aerial seeding with the silver iodide mixture were observed to persist for over 90 min after seeding and 100 km downwind of the seedline. The aircraft was able to locate and track the line source of AgI using an ice nucleus counter. High ice crystal concentrations due to seeding were not apparent until more than one hour after seeding. This may have been partially due to the high natural concentrations of ice, but post-mission analysis revealed that most sampling passes during the first hour following seeding were made below the AgI seeded volume. Ice nucleus measurements confirmed sampling of the seedline from 1-1.5 h after seeding, with associated increases in ice crystal concentrations. The effectiveness of the seeding material in the field was higher than laboratory measurements would suggest. (Fish-PTT)

NEW GENE SOURCES FOR DEVELOPMENT OF AGRONOMIC PLANTS WITH TOLERANCE TO DROUGHT AND OTHER ABIOTIC STRESSES.
New Mexico State Univ., Las Cruces. Dept. of Chemistry
G. D. Kuehn.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-140229/AS. Price codes: A04 in paper copy, A01 in microfiche. New Mexico Water Resources Research Institute, Las Cruces, Technical Completion Report No. 247, November 1989. 60p, 15 fig, 7 tab, 106 ref. USGS Contract No. 14-08-0001-G1438-05. USGS State Project No. 1423618 and 1423698.

Descriptors: *Drought resistance, *Genetic engineering, *Plant physiology, *Plant-water relationships, *Proteins, Abiotic stresses, Alfalfa, Cotton, Plant stress, Thermophilic eubacteria, Uncommon polyamines.

This project was an investigation in plant biochemistry/molecular biology/molecular genetics directed toward saving water through the development of water-conserving plants. The central, specific objective was to determine whether the thermophilic eubacterium, Thermus thermophilus HB8, produced one specific enzyme protein responsible for the biosynthesis of a class of compounds newly

discovered in higher plants called uncommon polyamines. Uncommon polyamines may be protectants against abiotic stresses such as drought and heat. The rationale of the project was that if the central objective could be achieved, then the gene in T. thermophilus which produced the unique enzyme protein would be a valuable objective for cloning and transfer from the bacterium to plants using recombinant DNA methods. This transfer might confer improved tolerances in plants towards drought and heat stresses. The major conclusions of the project were the following: (1) Numerous criteria based on purification trials of the protein from T. thermophilus indicated that one unique protein is responsible for all uncommon polyamine biosyntheses; (2) The enzyme protein demonstrated extraordinary catalytic efficiency indicating that it would be an excellent candidate for isolation of its gene and its transfer to plants; (3) Unexpectedly, plants themselves were discovered to produce this enzyme protein and the uncommon polyamines in preselected drought-tolerant alfalfa and heat-tolerant cotton strains and; (4) Metabolic inhibitors were identified which could be exploited to develop cell selection protocols which may yield crop plants with improved drought tolerances. 3C. Use Of Water Of Impaired Quality

EFFECT OF IRRIGATION WITH SEWAGE EFFLUENT ON DECOMPOSITION OF LITTER IN PINUS RADIATA FORESTS.
New Zealand Forest Service, Rotorua. Forest Research Inst.
T. G. Baker, W. J. Dyck, P. G. Barton, G. R. Oliver, and G. Nicholson.
Forest Ecology and Management FECMDW, Vol. 31, No. 4, p 205-214, April 1990. 2 fig, 4 tab, 21 ref.

Descriptors: *Detritus, *Organic matter, *Pine trees, *Wastewater disposal, *Wastewater irrigation, *Water pollution effects, Calcium, Forests, Hydrogen ion concentration, Magnesium, Phosphorus, Spray irrigation.

Two Pinus radiata D. Don forests (aged 18 and 25 years) were spray irrigated for 32 months with domestic sewage effluent from a secondary oxidation pond. Effluent was applied at rates of 25 and 50 mm/wk. Irrigation decreased litter organic matter by 43%-57% but there was no change in organic matter in the soil (0-50 mm). Annual loss constants determined from a litter bag study in one forest approached 1.0 in the irrigated plots, compared to 0.48 in the control. Irrigation increased the pH and the availability of P, Ca and Mg in the soil. Increased concentrations of N, P, Ca, and Mg in irrigated litterbags were closely correlated with increases in the rate of decomposition of the organic matter. The effect of irrigation on decomposition was due, in part, to the maintenance throughout the year of a more suitable environment in the litter for decomposers, particularly during dry summer periods. DIFFERENTIAL RESPONSE OF WHEAT AND BARLEY GENOTYPES TO SUBSTRATE-INDUCED SALINITY UNDER NORTH INDIAN CONDITIONS.
Govind Ballabh Pant Univ. of Agriculture and Technology, Pantnagar (India). Dept. of Agronomy.
A. P. Prabhakaran Nair, and N. C. Khulbe.
Experimental Agriculture EXAGAL, Vol. 26, No. 3, p 221-225, April 1990. 4 tab, 8 ref.

Descriptors: *Barley, *India, *Irrigation effects, Saline soils, *Salt stress, *Salt tolerance, *Wheat, Altitude, Climates, Crop yield, Genotypes, Irrigation, Plant reproduction, Salinity, Water use efficiency.

A crucial problem in low altitude agriculture is the shortage of adequate agricultural land. In India, about seven million hectares of salt-affected land adjacent to irrigation systems pose a potential threat to the quality of the irrigation water. Ten wheat and barley genotypes were tested for their response to soil salinity regimes varying from 0 to 16 mmhos/cm. Barley showed remarkable resistance to salt stress, linked to its capability to resist efflux of potassium ions from the plant system. Both crops showed substantial yield reductions at 12 mmhos/cm, but barley still outyielded wheat by over 50%. There were significant interactions between salinity levels and genotypes in wheat but not in barley. The wheat variety Sonalika showed poor salt tolerance. The implications of these findings in breeding salt-tolerant varieties are the possibility of reclaiming salt-affected land by seeking salt tolerant crops for use on these soils. This investigation shows that long term and sustainable approaches to combat salt affected lands in India require a switch from conventional breeding for yield strategies to those of selection for tolerance to salt stress. EFFECTS OF SALINE WATER IRRIGATION ON GROWTH AND MINERAL DISTRIBUTION IN GUAR (CYAMOPSIS TETRAGONOLOBA (L.) TAUB).
Karachi Univ. (Pakistan). Dept. of Botany.
D. Khan, R. Ahmad, S. Ismail, and S. H. Zaheer.
Pakistan Journal of Botany PJBOB6, Vol. 21, No. 2, p 290-301, December 1989. 5 fig, 3 tab, 22 ref.

Descriptors: *Guar, *Plant growth, *Saline water irrigation, *Salt stress, Calcium, Potassium, Sodium.

Growth and mineral distribution of a local strain of guar (Cyamopsis tetragonoloba (L.) Taub) were investigated in relation to salinity. Growth in terms of height and dry matter of different plant parts decreased significantly under salinity. Threshold ECiw inducing 50% reduction in seed production was 5.76 dS/m). Net reproductive effort of the plants treated with 30% sea water was 10.85%, as compared to 27.32% in control. Salinity decreased the number of pods and seeds per plant, whereas, the number of seeds per pod were unaffected and averaged around 7-8 seeds. Distribution of seeds among pods was leptokurtic in all the cases but with salinity variance increased and distribution tended to be more negatively skewed. Absorption of Na+ and K+ increased with salinity, whereas K+ declined at high salinity. Absorption of these ions was almost equal at 20% sea water treatment. Ca++ absorption although declined with salinity, Mg++ behaved indifferently. Distribution patterns of ions showed that plant responded to salinity by excluding ions from reproductive parts specifically from the seeds. All cations were generally more allocated in leaves. MICROALGAE PRODUCTION AND SHELLFISH FEEDING TRIALS AT THE ROSWELL TEST FACILITY.
New Mexico State Univ., Las Cruces. Southwest Technology Development Inst.
B. Goldstein.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-2223164/AS. Price codes: A05 in paper copy, A01 in microfiche. New Mexico Water Resources Research Institute, Las Cruces, Technical Completion Report No. 249, March 1990. 68p, 29 fig, 5 tab, 21 ref. USGS Contract No. 14-08-0001-G1438. USGS State Project No. 1423695 and 1423659.

Descriptors: *Aquaculture, *New Mexico, *Shellfish farming, Algae, Algal growth rate, Algal productivity, Clams, Microalgae, Mollusks, Oysters, Saline water.

It has been demonstrated that several microalgae species, which are thought to be good food for feeders, will survive and grow in Roswell Test Facility (RTF) saline groundwater at pilot scale (50 cu m raceways). Under specific environmental and cultural conditions, several species of shellfish have demonstrated excellent survival and growth. However, the productivity and cultural stability of algae are greatly diminished during cold months of the year in Roswell (October to March). The potential for commercial production of bivalve mollusks in saline groundwater in southern New Mexico is great if a site can be found that has a source of geothermal water for heating purposes and a source of saline water that will support the growth of marine species. A concerted effort should be made to locate such sites, and to construct and operate a large pilot-scale facility at the site. Simultaneously, algae and shellfish should continue to be grown at pilot scale in Roswell to demonstrate the technical feasibility to the private sector and to optimize methods for growing marine organisms hundreds of miles from the nearest ocean. IRRIGATION WITH MEMBRANE PLANT CONCENTRATE: FORT MYERS CASE STUDY.
Boyle Engineering Corp., Fort Myers, FL.
E. Edwards, and P. Bowdoin.
Desalination DSLNAH, Vol. 78, No. 1, p 49-58, July 1990. 4 tab, 3 ref.

Descriptors: *Case studies, *Desalination wastes, *Irrigation water, *Land disposal, *Membrane processes, *Salinity, *Waste disposal, *Wastewater irrigation, *Water treatment wastes, Desalination, Dissolved solids, Drainage water, Florida, Golf courses, Reverse osmosis, Salt tolerance, Trace elements, Wastewater disposal, Water quality data.

Use of irrigation as the primary disposal method of membrane plant concentrate becomes more difficult as the salinity and total dissolved solids (TDS) of the feedwaters increase beyond the freshwater levels. Crop tolerances to specific ions become of greater concern. Blending with suitable irrigation water supplies is a means of decreasing the applied salinity and TDS concentrations. Guidelines for interpretation of water quality for irrigation are discussed, along with a list of recommended maximum trace element levels in irrigation waters. A case study was made of the Fort Myers membrane softening plant. Water quality data was obtained and analyzed for the feed and reject water (concentrate) from the pilot scale testing plant on June 22, 1988. One possible use for the waste concentrate is as a supplemental irrigation supply for the golf course located adjacent to the City's proposed water plant site. Excess concentrate not utilized for irrigation will be discharged off of the golf course site in accordance with the drainage plan of the course. Plans for use of concentrate from the pro-

posed Fort Myers membrane softening plant must encompass a wide variety of considerations including determination of the irrigation suitability of the concentrate without blending, a study of the potential impacts of introducing concentrate to the existing surface water, a study of the potential impact on groundwaters beyond projected zones of discharge, and a study of the potential impact from discharge of excess blended waters to the City's stormwater drainage system. The use of membrane softening concentrate as an irrigation supply appears feasible for the City of Fort Myers, based on generalized irrigation guidelines and applicable state water quality criteria. LEAKAGE CONTROL IN A UNIVERSALLY METERED DISTRIBUTION SYSTEM: PINETOWN WATER'S EXPERIENCE.
Pinetown Regional Water Services Corp., Natal (South Africa).
R. E. Mills.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 3, p 235-241, June 1990. 4 fig, 3 tab, 3 ref.

Descriptors: *Leakage, *South Africa, *Water distribution, *Water loss, *Water metering, Computers, Cost analysis, Hydraulic valves, Minimum flow, Monitoring, Sounding, Water districts, Water pressure.

As a result of water losses reaching a high point of 16% in 1973, combined with a relatively high and increasing retail tariff, the Pinetown Regional Water Services Corporation (Natal, South Africa) embarked upon a program to reduce losses to an acceptable level of about 10%. The program involved: (i) the establishment of district metering throughout the distribution system; (ii) the replacement of certain retail meters; and (iii) the metering of new fire connections (other than those serving sprinkler installations). Further steps were taken to improve the situation and included monitoring of minimum night flows, regular sounding of distribution mains and the establishment of a full-time waste detection gang. Also with improved control valves becoming available, more effective pressure control of the system was achieved. The Corporation's computer was called upon to determine monthly losses from each of the hundred or so districts, the life history, in graphical form, of retail meters under review and a record of expenditure on leakage control. The development of methods used in leakage control (costing less than half a cent per cubic meter of water purchased) and practical experience gained in reducing losses from 15% to less than 5% over a period of 14 years resulted in a reduction in leakage losses and a better working knowledge of the distribution system. Optimal irrigation scheduling requires precise estimates of soil moisture status in the soil profile. Since soil moisture exerts a direct influence on the plant's physiological process, the daily prediction of soil moisture availability in the crop root zone is needed. A model is presented which, when given the inputs of soil, plant, and climatic parameters, predicts water use and soil moisture content in the wheat root zone. The daily estimates of evapotranspiration were obtained and separated into evaporation and transpiration. The transpiration was extracted from the soil profile depending on the rooting densities available in different soil layers. Daily transpiration values were added up to arrive at optimal irrigation schedules. The predicted values were quite close to the values observed in the fields for a range of water management options. Simulation runs of the model revealed that an optimal use of 37.5 cm of water during the season gave reasonably good water application efficiency. (Brunone-PTT)

EFFECT OF SCHEDULING IRRIGATION AND PHOSPHORUS LEVELS ON YIELD OF PIGEONPEA IN GANG COMMAND AREA.
Rajasthan Coll. of Agriculture, Udaipur (India). Dept. of Agronomy.
M. Lal, and O. P. Gupta.
International Journal of Tropical Agriculture IJTADD, Vol. 7, No. 1/2, p 56-64, March/June 1989. 2 fig, 4 tab, 16 ref.

Descriptors: *Crop yield, *India, *Irrigation practices, *Legumes, *Phosphorus, Climates, Irrigation requirements, Plant growth, Plant nutrients, Plant water potential, Water stress, Water use efficiency.

Two years of field research showed that in pigeonpea, branching and flowering stages were critical for moisture stress. Application of water, through irrigation, at these two crop stages, gave average pulse yields of 22.03 q/ha and resulted in water use efficiency (WUE) of 5.55 kg/mm/ha. Irrigation applied at other crop stages gave significantly less pulse yield and WUE. Scheduling irrigation by climatological approach showed that cumulative pan evaporation (CPE) of 125 mm was equivalent to two irrigation periods, at branching and flowering stages, for pulse yield and WUE. But at this CPE, three to four applications of irrigation water had to be applied. More frequent irrigation did not increase pigeonpea yield. Pigeonpea responded significantly to the application of phosphorus (up to 60 kg orthophosphate/ha) with pulse yield increased of 2.84 q/ha and WUE by 9.9% over the control. (Author's abstract)

A. Rajagopalan, K. Sudhakara, R. Ravegndran Nair, and G. S. L. H. V. Prasada Rao.
International Journal of Tropical Agriculture IJTADD, Vol. 7, No. 1/2, p 111-117, March/June 1989. 1 fig, 5 tab, 6 ref.

Descriptors: *Banana, *Consumptive use, *Irrigation effects, *Irrigation practices, *Plant growth, Basin irrigation, Drip irrigation, India, Irrigation requirements, Plant physiology, Plant water potential, Soil types, Soil water, Subsurface irrigation.

Banana growers in the Kerala region of India cultivate the crop under rainfed conditions where soil moisture stress is severe during the bunch emergence stage. The conventional method of basin irrigation at different frequencies, drip irrigation and subsoil injection of water were studied on Nendran bananas grown in clay loam soils. Basin irrigation at 20 mm on alternate days was superior to drip irrigation and subsoil injection for growth and yield of bananas. For water use efficiency, 5 mm water, via subsoil injection, on alternate days and 2.5 mm water, via drip irrigation, on every day were the most efficient methods. Frequent basin irrigations with 40 L water favor the growth and yield of the Nendran banana. In areas where irrigation water is available in plenty and labor is cheap, irrigation every two days is recommended. In places where irrigation water is available, but labor charges are high, irrigation with 40 L water every five to six days is recommended. In places where both water and labor are scarce, drip irrigation should be practiced. (Brunone-PTT)

EFFECT OF ROCK BUNDS AND TIED RIDGES ON SOIL WATER CONTENT AND SOIL PROPERTIES IN THE SUDAN SAVANNAH OF BURKINA FASO.
Semi-Arid Food Grain Research and Development Office, Ouagadougou (Burkina Faso).
N. R. Hulugalle, J. de Koning, and P. J. Matlon.
Tropical Agriculture TAGLA2, Vol. 67, No. 2, April 1990. 2 fig, 3 tab, 20 ref.

Descriptors: *Agricultural hydrology, *Cultivated ands, *Soil water, *West Africa, Agricultural unoff, Clays, Crop production, Cultivation, Organic matter, Particle size, Rock bunds, Sand, Silt, Sorghum, Tied ridges.

A trial was conducted during the growing seasons of 1985 and 1986 in the Sudan Savannah of Burkina Faso, West Africa, to evaluate the effect of ock bunds and tied ridges constructed by donkey-raction on soil water content and soil properties. Soil water content was measured by gravemetric ampling at 7 to 10-day intervals during the season. Soil sampled from 0-0.05 m depth at the termina-ion of the trial was analyzed for particle size istribution, organic matter content and soil water etention. Rock bunds increased soil water content n the surface 0.30 m immediately above a rock line y an average of 32% in both 1985 and 1986. Away from the rock lines, bunds had no effect whereas tied ridges increased soil water content. At 2 m below a rock line, soil water content was ncreased by an average of 23% in 1985 and 19% n 1986 and midway between two rocklines by an verage of 11% in 1985 and 18% in 1986. Both ock bunds and tied ridges improved water conser-ation in the short-term, with the tied ridges being ore efficient. Soil water retention and clay con-nt in the surface 0.05 m were, however, greater ith rock bunds and greatest when tied ridges and ock bunds were combined. Sand, silt and soil rganic matter were not affected by either rock unds or tied ridges. Sorghum grain yield was creased only by tied ridges, and was due primari-to increases in soil water content during flower-g. Yield was greatest, however, when tied ridges ere combined with rock bunds. It was concluded at tied ridges were more efficient than rock unds in increasing soil water content during the owing season. Rock bunds were, however, more fficient in reducing loss of clay particles in surface noff. (Author's abstract)

OMPUTERIZED SCHEDULING FOR IRRI-ATION MANAGEMENT AND PUMPING OP-RATIONS IN THE WATERCOURSE COM-AND.
ational Agricultural Research Centre, Islamabad akistan).
Ahmad, and D. F. Heermann.
gricultural Water Management AWMADF, Vol. , No. 1, p 1-13, May 1990. 1 fig, 3 tab, 13 ref.

escriptors: *Computerized irrigation scheduling, rrigation, *Irrigation efficiency, *Irrigation heduling, *Model studies, *Pakistan, Agricultur-hydrology, Demand irrigation, Farming, Fixed-tation irrigation, Simulation.

model to simulate the irrigation schedules of a tercourse command was developed to predict opping intensity, net farm return, farm water use, rcent water utilized, deep percolation at farm el, rainfall contribution, and extra tubewell ter pumped. Schedules for three selected farms a watercourse command in Sargodha, Pakistan re simulated with three fixed-rotation strategies d compared to a demand strategy. The fixed-ation strategies were also compared for evalua-n of the allowable depletion criteria. Evaluation simulation (1973-1982) showed that the three ed-rotation systems reduced the net farm return 28-43% from that of a demand strategy. The ed-rotation system also had 17-39% in water npage and energy consumed will be reached in ixed-rotation system. The change of the fixed-ation system to a demand system will signifi-cantly increase the net farm return in addition to improved water allocation to various farms on a watercourse command. The demand strategy will provide savings in energy due to scheduled pumping operations and effective utilization of canal water supplies. (Author's abstract)

ADOPTING WATER-CONSERVING IRRIGATION TECHNOLOGY: THE CASE OF SURGE IRRIGATION IN ARIZONA.
Idaho Univ., Moscow. Dept. of Agricultural Economics.
R. H. Coupal, and P. N. Wilson.
Agricultural Water Management AWMADF, Vol. 18, No. 1, p 15-28, May 1990. 3 tab, 24 ref, append.

Descriptors: *Arid lands, *Arizona, *Cost analysis, *Furrow irrigation, *Irrigation, *Irrigation efficiency, *Surge irrigation, Agricultural water, Deserts, Farming.

Surge-flow irrigation technology is a potential means for increasing irrigation efficiencies in desert agriculture. An economic analysis of the adoption decision for Arizona farmers reveals that an investment in surge irrigation is only economically viable when developing new agriculture lands or where gated pipe is already in use. Since the majority of the agricultural land in Arizona is furrow irrigated using ditches and syphon tubes, the potential for high adoption rates on existing farmland is rather limited. The analysis indicates that water costs, under conservative but realistic assumptions, would have to rise to $0.08/cubic m ($100/acre foot) before surge irrigation would be economically viable as a substitute for open ditch furrow irrigation. Further research is needed on potential labor savings and management efficiencies related to surge irrigation in order to measure potential profitability more accurately. (Author's abstract)

ESTIMATION OF MANNING'S ROUGHNESS COEFFICIENT FOR BASIN AND BORDER IRRIGATION.
Bangladesh Agricultural Research Inst., Joydebpur.
M. Harun-ur-Rashid.
Agricultural Water Management AWMADF, Vol. 18, No. 1, p 29-33, May 1990. 1 tab, 5 ref.

Descriptors: *Bangladesh, *Irrigation, *Mannings equation, *Roughness coefficient, *Surface irrigation, Agricultural hydrology, Data interpretation, Volume balance analysis, Water potentials.

Selection of a specific surface roughness value in a particular field situation in surface irrigation is not well established. Therefore a technique for determination of surface roughness values for basin and border irrigation from irrigation field data was developed. Volume balance analysis, a partial differential form of the continuity equation, and Manning's equation for open channel flow were used as governing equations. The forward difference approximation of the finite difference method was used as the solution technique. Flow resistance (Manning's n) is one of the important factors which govern the flow in irrigation basins and borders. Accuracy of results by the present technique depends on the accuracy of input data, particularly the surface water depth data. The accuracy of surface water depth data is again dependent on the levelness of the field and the efficiency, experience and visual judgment of the observer. If a good set of irrigation field data is available, a reasonable result can be obtained from the analysis of this technique. Field data collected from the central farm of Bangladesh Agricultural Research Institute at Joydebpur was used to test the technique. Roughness values derived by this technique were compared with those reported by several investigators. A reasonably good agreement was found between the predicted and reported roughness values. Field experiments were conducted at Phoenix, Arizona to investigate the usefulness of canopy temperatures in screening wheat genotypes for water use and yield characteristics. Six spring wheat (Triticum aestivum L.) cultivars were grown under well-watered conditions and two deficit irrigation regimes. Canopy temperatures were measured daily at 1045 hours, 1345 hours and 1545 hours using hand-held infrared thermometers. Leaf stomatal conductances were obtained between 1245 and 1400 hours. Seasonal water use was estimated via a soil water budget approach. There were small but consistent differences in canopy temperatures among cultivars in the well-watered treatments. Yecora, the warmest cultivar, had a mean midday canopy temperature of 25.1 C over the growth period from stem elongation until the hard dough stage of growth; Siete cerros, the coolest, was 23.3 C. Canopy temperatures values were lower earlier and later in the day but all cultivars maintained the same ranking relative to each other. Cultivars with higher midday canopy temperatures under well-watered conditions used less water and had lower stomatal conductances than those with cooler temperatures. Grain yields for all cultivars were similar under well-watered conditions but varied considerably under water stress. Cultivars that were warmest when well-watered maintained the highest relative yields when exposed to deficit irrigation regimes. Results indicate that routine canopy temperature comparisons between new cultivars and genotypes having well-known water use and yield characteristics will provide additional selection criteria for maximizing performance under water stress conditions. WATER AND FERTILIZER INTERRELATIONS WITH IRRIGATED MAIZE.
Obafemi Awolowo Univ., Ile-Ife (Nigeria). Dept. of Agricultural Engineering.
H. O. Fapohunda, and M. M. Hossain.
Agricultural Water Management AWMADF, Vol. 18, No. 1, p 49-61, May 1990. 6 fig, 4 tab, 12 ref.

Descriptors: *Corn, *Crop yield, *Fertilization, *Irrigation, *Nigeria, *Sprinkler irrigation, Crop production, Maize, Soil water, Water potentials, Water requirements.

Maize yield interactions with water and fertilizer using a line source sprinkler system were examined. Field studies were conducted at the Teaching and Research Farm of the Obafemi Awolowo University, Ile-Ife, Nigeria between December, 1984 and February, 1986 on a silty loam soil classified as an Alfisol. The experiment was conducted twice for two seasons. Maize yields as related to water applied and fertilizer used were determined using a line source sprinkler system. The line source irrigation system used impact sprinklers at 6.1 m intervals along the lateral. The average discharge per sprinkler was 0.51 L/second with a wetting diameter of 30 m. Generally, maize yields increased with increasing water and fertilizer applications. The maximum grain yield of 6.15 ton/hectare was produced with 523 mm of water and 300 kg/hectare of NPK (15-15-15) fertilizer, while the highest dry matter yield of 17.84 ton/hectare occurred with 495 mm of water and 300 kg/hectare of NPK fertilizer. Maize yields were highly correlated with water and fertilizer. A highly significant water x fertilizer interaction (at 1% level) indicated high maize yields when fertilizer uptake is enhanced by high soil moisture level. Water productivity was increased by fertilizer application, but the relationship was not as definite with soil moisture. Produc-

LIBRARY U. OF I. URBANA-CHAMPAIGN

tion functions were generated to reliably predict maize yields. (Mertz-PTT)

DYNAMICS OF ROOT AND SHOOT GROWTH OF BARLEY UNDER VARIOUS LEVELS OF SALINITY AND WATER STRESS.
Agriculture and Water Resources Research Centre, Baghdad (Iraq). Dept. of Soil and Land Reclamation.
S. Al-Khafaf, A. Adnan, and N. M. Al-Asadi.
Agricultural Water Management AWMADF, Vol. 18, No. 1, p 63-75, May 1990. 9 fig, 4 tab, 22 ref.

Descriptors: *Barley, *Crop yield, *Evapotranspiration, *Irrigation, *Plant water potential, *Saline soils, *Water stress, Dry weight, Growth, Roots, Salinity, Soil water.

Response of barley to water stress at different growth stages at various levels of soil salinity was studied in cylindrical wooden containers (1.1 m long and 0.6 m in diameter). The treatments consisted of three salinity levels and two irrigation treatments; no water stress at any given growth stage, and plants exposed to water stress at either tillering, vegetative, flowering or seed formation stage and normally irrigated in the other stages. Comparison in above-ground dry weights indicated a significant variation between different treatments at each sampling date. The interaction between salinity and water stress was also significant. Maximum reduction in shoot dry weight was 70% under high salinity treatment when the plants were exposed to waste stress in the vegetative growth stage. The relative reductions in shoot dry weights due to salinity at the vegetative growth stage were 33% for medium salinity and 46% for high salinity, in comparison with low salinity treatment. Root dry weights significantly varied between different treatments. The highest reduction in root dry weights was recorded when the plants were exposed to water stress and/or salinity at the vegetative growth stage. Linear relations between evapotranspiration and above-ground dry weights, grain yields and root dry weights were obtained. Regardless of water stress or salinity levels, barley grain, above ground dry weights, and root dry weights were correlated with evapotranspiration. (Author's abstract)

HEAT STRESS, PLANT-AVAILABLE SOIL MOISTURE, AND CORN YIELDS IN IOWA: A SHORT- AND LONG-TERM VIEW.
Iowa State Univ., Ames. Dept. of Agronomy.
R. E. Carlson.
Journal of Production Agriculture, Vol. 3, No. 3, p 293-297, July/September 1990. 6 fig, 2 tab, 19 ref.

Descriptors: *Available water, *Corn, *Crop yield, *Iowa, *Soil-water-plant relationships, *Thermal stress, History, Model studies, Regression analysis, Soil water, Stress, Temperature, Weather.

A study was conducted to identify weather factors that significantly affect corn production in Iowa from available long-term weather records. Regression analysis identified heat stress and plant available soil moisture as the two most important weather-related variables affecting corn yields in central Iowa. Heat stress was defined as the monthly or seasonal accumulation of the number of degrees each day when maximum temperatures exceeded 86 F (30 C). The regression model used included terms representing technology (time), heat stress in July and August, 1 July plant-available soil moisture in the top five feet of soil, and an interaction term between the last two variables. The model accounted for 90% of the variation in corn yield between 1954 and 1988. Time trends accounted for 62% of the yield variation, and weather factors for 28%. When July 1 plant available soil moisture was below normal (approximately 7 in), heat stress in July and August caused greater yield reductions than when plant available soil moisture was above normal. To compare the present climate with previous years, a seasonal heat stress variable was computed for 1900-1988. This revealed periods of both benign (1958-1975) and hostile (1900-1957) characteristics relative to expected and realized corn yields. Runs of stressful days each season showed similar patterns of season to season variability. The 1 July plant available moisture trends for central Iowa clearly show that the benign period mentioned was also one of adequate levels of crop growing season soil moisture. This work identifies two variables (heat stress and 1 July plant-available soil moisture) that, over a long period of time, reveal considerable interannual variability. The late 1950's, the 1960s, and the early 1970s were very favorable for corn production in central Iowa, as well as in other parts of the midwest. This data reveals this to be an unusual and benign time period when compared to other time periods of this century. The ups and downs of the 1908s may be closer to current expected weather. CROPPING SYSTEM AND TILLAGE EFFECTS ON AVAILABLE SOIL WATER AND YIELD OF GRAIN SORGHUM AND WINTER WHEAT.
Southwest Kansas Research-Extension Center, Garden City.
C. A. Norwood, A. J. Schlegel, D. W. Morishita, and R. E. Gwin.
Journal of Production Agriculture, Vol. 3, No. 3, p 356-362, July/September 1990. 8 tab, 11 ref.

Descriptors: *Crop yield, *Soil-water-plant relationships, *Sorghum, *Tillage, *Wheat, Available water, Comparison studies, Garden City, Kansas, Productivity, Soil water, Tribune, Water conservation.

Wheat (Triticum aestivum L.), in the central or southern Great Plains, is grown in a 2 yr wheat-fallow (WF) cropping system or with grain sorghum (Sorghum bicolor (L.) Monech) in a 3 yr wheat-sorghum-fallow (WSF) system. Tillage during fallow causes loss of crop residue and soil water. Long-term studies were conducted at Garden City and Tribune, KS, to determine the effects of cropping system and reduced tillage on available soil water and yield of dryland winter wheat and grain sorghum. Conventional (CT), reduced (RT), minimum (MT), and nontillage (NT) systems were compared with CT in sorghum-fallow (SF), continuous sorghum (SS), and continuous wheat (WW). Reductions in tillage resulted in increased available soil water and yield. Reduced tillage resulted in increased WF yields at both locations, while WSF wheat yields were increased at Tribune. Sorghum yields were more consistently increased by reduced tillage at Tribune. Sorghum-fallow yields were higher than WSF sorghum yields at Tribune. Wheat-fallow yields usually did not differ from WSF yields at either location. Sorghum yields in WSF exceeded SS yields 67% of the time at Garden City. At Tribune WSF-RT yields exceeded SS yields 73% of the time, while WSF-CT yields were no better or less than SS yields 60% of the time. Continuous wheat yields were less than other wheat yields 98% of the time. In terms of soil water storage and yield, the WSF system is appropriate for both locations, and is more effective when combined with reduced tillage, particularly at Tribune. (Author's abstract)

Descriptors: *Groundwater, *Irrigation scheduling, *Management planning, *Nebraska, *Optimum development plans, *Water conservation, Dynamic programming, Irrigation systems, Model studies, Regulations, Water allocation.

How to optimally manage irrigation systems under water limiting groundwater regulations is an increasingly common question in the Western United States. Methodologies for addressing this question were developed and applied to a Nebraska case study region. Dynamic programming was used to analyze both inter-seasonal planning decisions and intra-seasonal irrigation scheduling decisions. The optimum plan for Central Nebraska under ground water limitations was generally to produce continuous corn at less than full irrigation. For some water limiting conditions a permanent or short term disinvestment in irrigation systems was found to be profitable and small acreages of alternative crops emerged as appropriate in a few instances. Optimum intra-seasonal irrigation scheduling involved establishing a target marginal net return based on the planning model and then applying water to meet the target, with consideration of actual weather and the plant response in each growth stage. Optimum development of water resources for irrigation and hydropower generation is a high priority consideration in the economic development of most developing countries, as food and energy continue to be among the most pressing needs. A real-time operational methodology was developed for a multipurpose reservoir operation for the generation of hydroelectric power irrigation water, which was applied to the Bhadra reservoir system in the state of Karnataka, India. The method consists of three phases of computer modeling. In the first phase, the optimal release policy for a given initial storage and inflow is determined using a stochastic dynamic programming model. Streamflow forecasting using an adaptive AutoRegressive Integrated Moving Average model constitutes the second phase. A real-time simulation model is developed in the third phase which uses the forecast inflows from the second phase and the operating policy from the first phase. A comparison of the optimal monthly real-time operation with the historical operation demonstrates the relevance, applicability and relative advantages of the proposed methodology. The construction of large hydroelectric developments on flatland rivers introduces large changes in their natural hydrologic regime. The 30-year period of operation of the Novosibirsk (Soviet Union) hydro development on the Ob River clearly confirms the indicated relation between fluvial processes in the river and operation of water-management objects of the city. The natural process of deep channel erosion diminished after damming the river and creation of the reservoir during the first decade of operation. In the second half of the 1960s, quarrying in the lower pool adjacent to the hydrostation began to have a substantial effect on the natural transformation process of the channel due to streamflow regulation and retention of sediments by the reservoir. During the period between 1966 and 1984 more than 40 million cu m of sand-gravel mixture was dredged from the river channel and floodplain, causing a decrease in water levels. A decrease in levels downstream led to a deficit of reservoir water resources in dry years. The priority of water users of Novosibirsk is partial restoration of the water levels in the stretch between the hydrostation and the city by constructing embankments damming nonnavigable branches and converting the channel into a single-branch channel. A radical solution for the problem of reliably providing water to consumes in the city is to reconstruct all intakes located downstream of the hydro development. (Fish-PTT)

The government's policy concerning the management of the dunes in The Netherlands on behalf of the interests of nature and the environment is causing constraints for the waterworks of North-Holland located in the dunes at the North Sea coast. The existing artificial recharge systems consist mostly of ponds and open canals in which imported pretreated surface water is infiltrated to provide a reliable drinking water supply in the province of North-Holland. Because the quality of the water, infiltrated by canals has a negative influence on ecological values, extension of this system will not be possible. An alternative is deep-well infiltration; instead of infiltrating by canals, water will be infiltrated in semiconfined aquifers, so there will be less influence on existing ecological values. The Provincial Waterworks of North-Holland are constructing a pilot plant with a capacity of 5 million cubic meters/acre/year to investigate its reliability and its suitability for a development as natural as possible for this region. The history of artificial recharge is presented along with an overall look at the preliminary investigations, and an overview of the main issues for a definite engineering. (Author's abstract)

Descriptors: *Artificial recharge, *Flow equations, *Recharge basins, *Sedimentation, *Water resources management, Computer models, Constant flow, Flow rates, Infiltration rate, Suspended sediments.

Among the various factors that reduce the rate of recharge in an artificial recharge basin with time, the settling of the suspended sediments in the recharge water is usually the most important. An equation has been developed to represent the change of infiltration rate of a turbid water with time and with the concentration of suspended sediments. This equation was further generalized to consider the effect of the basin size on the recharge rate. Optimal scheduling of consecutive recharge and dry periods was determined to result in the maximum recharge rate in the long run. A computer model was developed to provide the optimal design of an intermittent multibasin recharge (IMBR) system. The model was run using a set of real field data, and the results show that when a constant flow rate is available during the recharge season, IMBR would be a more efficient system of artificial recharge than either continuous or intermittent recharge on a single basin. PREDICTING WELL DRAWDOWN DURING PROLONGED PUMPING.
Westinghouse Environmental and Geotechnical Services, Cary, NC.
D. L. Goodrich.
Water Well Journal WWJOA9, Vol. 44, No. 8, p 32-33, August 1990. 2 fig.

Descriptors: *Groundwater movement, *Wells, Confined aquifers, Unconfined aquifers, *Aquifers, *Drawdown, *Pumping test, Water supply, Data interpretation.

An important consideration in groundwater management is whether prolonged pumping will result in dewatering of the aquifer. The first step in extrapolating the drawdown data beyond the end of a constant-rate pumping test is to plot the data from the test on semilogarithmic graph paper. The drawdown data from the test of an unconfined aquifer is usually corrected for locally diminished transmissivity and plotted above the field data. The trend of the actual artesian drawdown may be projected in a straight line to predict the drawdown after several months of continuous pumping.

LIBRARY U. OF I. URBANA-CHAMPAIGN

To simulate a maximum drawdown, the slope of the projected trend can be steepened to double that of the observed data. If the cone of depression is small in relation to the size of the aquifer, the drawdown will stabilize in less than 70 days in most situations. This procedure can be useful in predicting long-term drawdown when pumping a water supply well during periods of drought. (Miller-PTT)

In a procedure for determining cumulative impacts in bottomland hardwood forests (BLHF), changes in landscape integrity over time were assessed using structural and functional ecosystem indices. Historical records of suspended sediment, N, P, and turbidity from three streams in the Tensas Basin, Louisiana were analyzed. Significant positive relationships between water levels in these streams and concentrations of total P, total Kjeldahl N, total suspended sediment and turbidity confirmed a loading phenomenon characteristic of watersheds in which much of the original forest cover has been cleared. Eighty-five percent of the original forest in the Tensas Basin has been converted to agricultural fields. N/P ratios in two of the rivers (6.4:1 and 10.2:1 molar ratios) were lower than expected in P-limited freshwater systems, where N/P ratios are generally >10-15. Most of the excess in P is probably related to the geochemical adsorption of P to sediment particles and selective loading of P during erosive storm events. As a result, the nutrient limiting aquatic primary productivity may be N in much of the Tensas Basin. Between 1978 and 1986, P levels exceeded 0.1 mg/L 96% of the time (P >0.1 mg/L signals eutrophy in lotic systems). Total suspended sediment concentration patterns were erratic and in excess of 80 mg/L over half of the time in two of the three streams studied (1966-1986). A goal oriented management plan for improved water quality in the Tensas Basin was devised based on this cumulative impact assessment. Improvement of the ecosystem can be achieved in a number of ways, including the reestablishment of natural hydrologic flow wherever possible, the use of agricultural practices that reduce runoff, the protection of existing forested corridors along streams, and the mitigative creation of new buffering zones. (Author's abstract)

Descriptors: *Clear-cutting, *Forest watersheds, *Hydrologic budget, *Kershope Forest, *Soil water, *Spruce trees, Environmental effects, Evapotranspiration, Forestry, Land use, Precipitation, Rainfall-runoff relationships, Scotland.

From 1981-1985 the water balance of four 2 ha plots of a ploughed and drained Sitka spruce plantation was monitored. During 1983, three plots were clearfelled and a fourth was left standing as a control. A ground level rain gage over-collected during snow, but otherwise collected 3% more water than standard rain gages. Annual precipitation (1259-1688 mm) averaged 1439 mm. The forest canopy intercepted 38% and transpired 12% of gross precipitation. Fifty percent of gross precipitation was evaporated while 50% left the site as runoff. Throughfall and stemflow fractions of net precipitation were 0.87 and 0.13 respectively. After clearfelling, annual runoff increased to 68% of gross precipitation. After adjustment using the before and after comparison in the control plot, the decrease in annual evaporative loss resulting from clearfelling was 290 mm. (Author's abstract)

UNEXPECTED HYDROLOGIC PERTURBATION IN AN ABANDONED UNDERGROUND COAL MINE: RESPONSE TO SURFACE RECLAMATION.
Indiana Geological Survey, Bloomington.
D. Harper, G. A. Olyphant, and E. J. Hartke.
Environmental Geology and Water Sciences EGWSEI, Vol. 15, No. 3, p 179-187, May/June 1990. 5 fig, 2 tab, 12 ref.

Descriptors: *Coal mines, *Land reclamation, *Mine wastes, *Subsidence, Disturbance, Flooding, Geologic fractures, Potentiometric level.

A reclamation project at the abandoned Blackhawk Mine site near Terre Haute, Indiana, lasted about four months and involved the burial of coarse mine refuse in shallow (less than 9 m) pits excavated into loess and till in an area of about 16 ha. An abandoned flooded underground coal mine underlies the reclamation site at a depth of about 38 m; the total area underlain by the mine is about 10 sq km. The potentiometric levels associated with the mine indicate a significant (2.7 m) and prolonged perturbation of the deeper confined groundwater system; 14 months after completing reclamation, the levels began to rise linearly (at an average rate of 0.85 cm/day) for 11 months, then fell exponentially for 25 months, and are now stable. Prominent subsidence features exist near the reclamation site. Subsidence-related fractures were observed in cores from the site, and such fractures may have provided a connection between the shallower and deeper groundwater systems. (Author's abstract)

The drainage system in the City of New Orleans is extremely complex, containing conduits ranging from small circular pipes to very large open canals with complicated cross-sectional geometries. Invert slopes are low (sometimes zero) and permit the branching of flow in the downstream direction as well as flow reversal during runoff events. Both large and small conduits are surcharged and the entire flow must be pumped since the city is surrounded by levees. This network has been simulated using EPA's Storm Water Management Model (SWMM). SWMM provides a variety of alternative routing techniques, ranging from a quasi-steady state storage routing procedure in RUNOFF, to a finite difference solution of the Saint Venant equations in EXTRAN. The solution technique employed in EXTRAN is most suitable for New Orleans, but this block permits use of only six standard conduit shapes which do not always correspond to those which exist in the system. Since the system is not satisfactorily simulated by TRANSPORT, EXTRAN has been modified to permit the use of any shape whatsoever, whether it can be mathematically defined or not. The revised version of EXTRAN will accept and run data sets prepared for the standard program with no changes whatsoever and has been use to assess the effects of approximating unusual sewer shapes by the standard sections of EXTRAN. To determine whether the modifications to EXTRAN were correct, a network of rectangular and circular conduits, was analyzed using the modified version without user-defined conduits. Next, it was reanalyzed by sequentially replacing the rectangular and circular conduits one by one with user-defined shapes, which were actually rectangles and circles. This replacement created large differences in calculated flows and depths became progressively larger. This hydraulic radius computational error was corrected, yielding a maximum difference between flows commonly 0.01 cu ft/sec (cfs) and averaged 0.04 cfs. The results were compared with those shapes obtained for hydraulically equivalent rectangular and circular shapes. It was found that as the channels approach full flow, the differences diminished and at full flow the differences were negligible. (See also W91-01188) (Lantz-PTT)

The Storm Water Management Model (SWMM) model consists of hydraulic watershed simulation, water quality modeling, hydraulic routing, contamination prediction, and erosion estimation, as well as other features to function as a complete water quality and quantity model. Changes were made to the Runoff Block of SWMM in 1974 to include the option of an overflow section for pipes and channels, and routing capability to model storage reservoirs such as detention ponds. In March 1985, the revised version of the Runoff Block of SWMM was converted to a microcomputer version and named UDSWM2-PC which includes only the rainfall and runoff subroutines required for stormwater drainage modeling. The software was modified to be capable of reading and routing hydrographs previously generated by software which uses the synthetic unit graph convolution to predict storm hydrographs. In this study the UDSWM2-PC was further modified to include a pipe sizing capability which enables the software to compute the required pipe diameter for the given hydrographs. The new version, named UDSWM3-PC is capable of simulating flood propagations in a drainage system with or without existing pipes in the network. Results of this study indicate that the auto-pipe sizing greatly enhances the versatility of the UDSWM2-PC model. UDSWM3-PC can now be used for drainage basin analysis with or without existing storm sewers. The UDSWM2-PC model is inefficient with computer memory space. Approximately 90 arrays of 399 points are reserved for storing gutter and subbasin data. Only a portion of these arrays are utilized during computations depending on the total numbers of gutters and sub-basins in the drainage network. The remainder of the array space remains idle. The case study used only 4.5% of the reserved array space. (See also W91-01188) (Lantz-PTT)

W. G. Huber, and R. E. Dickinson.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 21-32, 3 fig, 9 ref.

Descriptors: *Management planning, *Rainfall-runoff relationships, *Storm Water Management Model, *Storm runoff, *Urban hydrology, *Urban runoff, *Water quality, Data interpretation, Model studies, Precipitation, Runoff, Storm water management, Water management, Water quality management.

Version 4 of the EPA Storm Water Management Model (SWMM) was released during September 1988. Improvements and changes include: full adaptation for microcomputer use, addition of natural channel geometry to the EXTRAN and Transport Blocks (using HEC-2 input formats), addition of subsurface quantity routing to the Runoff Block, ability to access recent National Weather Service precipitation and meteorological data and perform statistical analysis on these data, variable time steps in the Runoff Block, metrification of the Extran Block, and simplification of the input data. The model is available from the EPA Center for Exposure Assessment Modeling in Athens, Georgia. Version 4 of SWMM attempts to update and correct errors found in earlier versions, add new computational features, and make the program easier to run on a microcomputer without eliminating the option for use on main-frames. The conceptualization of the rainfall-runoff quality process remains the same, with attendant strengths and weaknesses. SWMM is expected to remain a familiar and improving tool for the analysis of urban hydrologic and similar problems for the foreseeable future. (See also W91-01188) (Lantz-PTT)

URBAN RUNOFF MODELING FOR ADMINISTRATIVE PURPOSES.
Wright Water Engineers, Inc., Denver, CO.
W. P. Ruzzo.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, COl. EPA Report No. EPA/600/9-89/001, January 1989. p 43-51.

Descriptors: *Flood plain management, *Hydrologic models, *Rainfall-runoff relationships, *Urban hydrology, *Urban runoff, Administration, Management planning, Model studies, Public policy, Runoff, Urbanization.

Computer modeling of urban runoff has advanced in the last decade, particularly with the advent of the personal computer. The modeling techniques for simulating watershed responses and real-time rainfall have increased the ability to more precisely predict the runoff peaks and hydrographs. This advance in modeling capabilities has benefited the overall understanding of the physical sciences. Input data as it relates to the actual end use of the model results has also advanced. In many cases the model results are used to develop a floodplain for regulatory purposes, or to develop hydrographs to design flood mitigation facilities. This aspect of modeling is more for administrative purposes and the decisions on the input data are not necessarily based on simulating the actual physical processes. Instead, decisions are made to facilitate the administration of the floodplain regulations or to provide a sound engineering basis for facilities which are designed for anticipated future development. Decisions were made during urban runoff modeling for several watersheds in the Denver area, are presented which required the model to account for anticipated future watershed conditions. The decisions are based on administrative considerations such as: (1) worst case scenarios, (2) limited jurisdictional control of development, (3) ability to accurately predict future conditions, and (4) local policies regarding stormwater management. The use of inadvertent detention that occurs upstream of road or railroad embankments, flood flows which become split from the main channel, projections of impervious land densities, and selection of watershed characteristics and routing patterns, are highlighted. Statistical modeling studies are presented for the City of Austin's two stormwater quality monitoring programs. One program monitors creeks of various large multiple-land use urban watersheds. The other program monitors flow and water quality of small single-land use urban watersheds and control structures. The stormwater quality and rainfall runoff data generally follow log-normal probability distributions. Based on the assumptions of normality or log-transformed normality, the data were analyzed using SAS computer programs. Regression equations relating runoff and rainfall variables were successfully developed for each watershed. Total and incremental pollutant loads for storms were regressed on runoff variables and antecedent rainfall conditions. Validation of the regression equation was dependent on statistical tests and specific precision standards. The amount of impervious cover in a watershed was chosen to represent the degree of urbanization for the watershed; the pollutant load per storm was found to linearly increase with the increase of watershed impervious cover. The pollutant concentration depended on various factors, many of which also relate to the amount of impervious cover. For the large watersheds, the concentration of many of those parameters was found to increase with impervious cover. For small urban watersheds these relationships do not exist; the concentration was dependent on the land use and maintenance. Results from two filtration basins and one wet pond support the City of Austin's watershed ordinance which specifies impervious cover limitations, and requires sedimentation and/or filtration basins for controlling stormwater quality for developing areas. A review of recent applications of SWMM in the New Orleans Metropolitan area is presented. The city and adjoining areas of Jefferson Parish are entirely enclosed by levees, have very little surface relief, and have drainage systems which are thoroughly interconnected and subject to reversals of flow. Rainfall amounts are heavy. The normal annual precipitation exceeds 60 inches and individual storms may produce totals of 10-12 inches in as many hours. In recent years extensive property damage resulting from flooding has been the impetus for studies intended to improve the capacity of systems which, in at least some cases, were built to dewater marsh and swamp land and are now used to drain developed urban areas. The standard SWMM blocks RUNOFF, TRANSPORT, and EXTRAN have all been used depending upon the particular circumstance. In addition, certain modifications have been made which make the model more useful in the New Orleans region. Among these are the use of 'Standard Streets' in a manner analogous to that employed in the Chicago Drainage Model, inclusion of user-defined conduits in EXTRAN, and improvement of the pumping calculations in EXTRAN to better simulate a system with multiple pumps and variable suction and discharge bay elevations. Simulation of storms in excess of the drainage system capacity illustrated the deficiencies by showing discharges at internal points. The inadequate sections were increased in dimension and other modifications were made in the modeled system unit it was capable of conveying the flow to the pump stations without flooding. A regional approach to stormwater detention is the current trend for stormwater master plan development in the Washington metropolitan region. The development of criteria for locating and designing regional basins, and the modeling approaches used to maximize regional detention benefits on a watershed basis are addressed. Stormwater models were applied to develop a regional detention basin master plan for Fairfax County, Virginia, along with a preliminary stormwater management investigation for Montgomery County, Maryland. Following the selection of regional detention basin sites and the completion of conceptual designs the SWMM/EXTRAN model and the Soil Conservation Service TR-20 model were used to determine the water shed wide impacts of alternative detention systems. To assess regional benefits, various locational schemes were analyzed for both county plans. The Fairfax County plan included the design of maximum efficiency basins which utilize lower maximum release rates to compensate for areas not controlled by regional facilities. The regional detention basin network, recommended in the Montgomery County investigation, demonstrated the use of extended detention on top of a permanent pool for water quality benefits. In several cases, in addition to water quality benefits, this type of design reduced the post-development 2-year peak flows to levels less than pre-development conditions. The TR-20 model was used to evaluate the watershed wide impacts of this type of design. In addition, a PC graphics package was developed to illustrate the watershed interactions of the routed TR-20 hydrographs. (See also W91-01188) (Author's abstract)

A regulatory driven technical guidance manual, including a compendium of model series, is being synthesized from widely available manuals and models to assist developers in planning stormwater control mechanisms, and to aid municipal officials in reviewing these plans. Design of wet detention basins, usually consists of determining in four steps: (1) the minimum surface area of the permanent pool, (2) the storage volume that will detain a specified runoff, (3) principal spillway size and additional storage volume for flood control and sediment accumulation, and (4) the dam and emergency spillway design parameters. Tables of the required surface area for a given drainage area, impervious, and watershed characteristics are used for the first step. The remaining steps are completed using a LOTUS 123 spreadsheet model. (See also W91-01188) (Lantz-PTT)

MODELING AND FIELD EVALUATIONS OF URBAN WET DETENTION PONDS.
North Carolina Univ. at Charlotte. Dept. of Civil Engineering.
J. S. Wu.
IN: Proceedings of Stormwater and Water Quality Model Users Group Meeting. October 3-4, 1988, Denver, CO. EPA Report No. EPA/600/9-89/001, January 1989. p 129-141, 1 fig, 8 tab, 17 ref.

Descriptors: *Detention reservoirs, *Field tests, *Model studies, *Urban hydrology, *Urban runoff, *Water quality, Management planning, North Carolina, Runoff, Water management, Water quality management.

An extensive stormwater sampling program was conducted on three existing urban wet detention ponds in the Piedmont region of North Carolina, and an EPA model was examined and verified for its usefulness in analyzing the water-quality improvement performance of urban wet detention ponds. By analyzing the pollutant removal data collected from eleven runoff events, a performance relationship was observed, permitting the incorporation of water quality improvement requirements into the proper sizing of wet detention ponds. To achieve a minimum level of urban runoff pollution control, the surface area ratio of detention ponds must be greater than 0.5%. Approximately 1% to 2% of the watershed area is needed for developing detention ponds to control 70% or more of the sediment load. (See also W91-01188) (Lantz-PTT)

Artificial substrates were used to monitor the invertebrate communities below a power peaking impoundment and a flow re-regulating impoundment on the Missouri River in Northeastern Nebraska. Invertebrate communities on shallow samplers subjected to exposure from diel fluctuations in flow averaged 3 taxa per sampler and 91 organisms per square meter. In the absence of diel fluctuations, number of taxa per sampler increased to 12 and mean densities increased to 743 per square meter. Fluctuating discharges had no significant effect on numbers of taxa or densities o

continually submerged artificial substrates. However, greater numbers of taxa and total densities were observed on deep (107 cm) versus shallow (30 cm) samplers below both impoundments. Polycentropodidae (Trichoptera), Chironomidae (Diptera) and Oligochaeta were observed to tolerate diel fluctuations and exposure below Fort Randall Dam while Hydropsychidae (Trichoptera) and Heptageniidae (Ephemeroptera) were extremely intolerant. Collector-gathers and predator-engulfers were the predominant functional groups colonizing samplers below both impoundments. Higher numbers of collector-gathers, collector-filterers, and scrapers were observed from samplers in the absence of diel flow fluctuations. These findings corroborate results from a number of other investigations, separated in space and time. Examined collectively, these studies provide the framework for understanding power peaking as a stress to benthic stream communities. (Author's abstract)

Using a previously treated basin as a control in subsequent paired watershed studies requires the control to be stable. Basin stability can be assessed in many ways, some of which were investigated for the South Fork of Caspar Creek in northern California. This basin is recovering from logging and road building in the early 1970s. Three storm-based discharge characteristics (peak discharge, quick flow, and total storm flow), daily flows, and concentration of suspended sediment were studied to see if the South Fork can be used as a control in a second experiment. Mean sediment concentration in three discharge classes and regression parameters for the other data were tested to estimate remaining treatment effects relative to the North Fork. Patterns of change were similar for most data, with rises in response followed by returns toward pretreatment conditions. The storm and sediment data showed few significant differences, but tests on daily flows indicated that differences still exist. The overall evidence suggests that the South Fork has returned to near pretreatment conditions. Better sediment data are needed for studies of the effects of land management. (Author's abstract)

Data are presented on the vegetation dynamics of two impounded marshes along the Indian River Lagoon, in east-central Florida. Vegetation in one of the marshes (IRC 12) was totally eliminated by overflooding and by hypersaline conditions (salinities over 100 ppt) that developed there in 1979 after the culvert connecting the marsh with the lagoon was closed. Over 20% recovery of the herbaceous halophytes Salicornia virginica, S. bigelovii, and Batis maritima was observed at that site after the culvert was reopened in 1982, but total cover in the marsh remains well below the original 75%. No recovery of mangroves was observed at this site. The second site (SLC 24), while remaining isolated from the lagoon during much of the study, did not suffer the complete elimination of vegetation experienced at the first site. At this location, mangroves increased in cover and frequency with a concomitant decrease in herbaceous halophytes. Considerable damage to the vegetation was evident at IRC 12 when the impoundment was closed and flooded for mosquito control in 1986. Although the damage was temporary, its occurrence emphasizes the need for planning and constant monitoring and adjustment of management details as conditions within particular marshes change. Storms and hurricanes may be important in promoting a replacement of black mangroves by red mangroves in closed impoundments because the former cannot tolerate pneumatophore submergence for long periods of time. Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4095, 1989. 38p, 17 fig, 7 tab, 13 ref.

Descriptors: *Model studies, *Peak flow, *Rainfall-runoff relationships, *Storm runoff, *Urban hydrology, *Urban runoff, *Utah, Peak discharge, Urban drainage, Urban watersheds, Wasatch Front.

Designers and planners for local, State, and Federal agencies need up-to-date methods for determining peak-flow characteristics for urban drainages along the Wasatch Front, Utah. This report summarizes methods used to develop equations that estimate peak-flows for small urban drainages along the Wasatch Front. Mathematical equations were developed that estimate peak flows for recurrence intervals of 2, 5, 10, 25, 50 and 100 years, for small urban drainages. Data entry to the equations requires measurements of basin slope, size and percent impervious area. Rainfall and runoff data collected from eight urban drainages along the Wasatch Front from 1984-86, were used to calibrate a rainfall-runoff model called DR3M-II. Rainfall data collected from 1948-83 at the National Weather Service Salt Lake City Airport station provided additional long-term data to the calibrated models. Log Pearson fits made to the peak flow data were used to estimate the recurrence interval peaks for each basin. Paired stations on Little Cottonwood Creek near Salt Lake City were used to help determine the effects of intervening urban drainage on peaks of larger streams. In general, peaks on larger streams caused by snowmelt and peaks caused by rainfall (where urban areas may have a significant effect) did not occur simultaneously. (USGS)

LIBRARY U. OF I. URBANA-CHAMPAIGN

The regulation of the southern Upper Rhine by dams down to Iffezheim has considerably changed the sediment balance of the stream. In the impounded sections fine-grained sediments are deposited, narrowing the cross section and impeding high-water discharge. The high illite content of the suspended material indicates that a considerable part of the settling sediment is derived from Alsatian potassium mining wastewaters. In the freely flowing Rhine downstream of Iffezheim, erosion occurs. Although the degradation of the riverbed downstream of the Iffezheim dam is prevented successfully by artificial addition of gravel, this has no positive influence on the erosion taking place farther north. This becomes apparent both in the petrographic composition of the bed load material as well as in its particle size distribution. Medium-grained to coarse gravel with high carbonate rock content is deposited upstream of Speyer. Downstream of Speyer, sand and fine gravel rich in crystalline components are taken up from the river bottom. This situation might be improved by appropriate addition of sand and fine gravel downstream of Iffezheim. (Author's abstract)

Increasing interest in suspended particles that control transport, partitioning, and bioavailability of a variety of contaminants in natural waters has necessitated the development of efficient dewatering/particle-concentration devices. The design and application of a hollow-fiber tangential-flow filtration device for concentration of bacteria and suspended particles from large volumes of surface water and groundwater samples (i.e., hundreds of liters) was described. The device is composed of a filtration module, containing two all polypropylene, hollow-fiber tangential-flow filtration cartridges (0.2 microm pore size), and a pump module. Filtrate flux rates (4-8 L/min) are equal to or faster than those of other devices that are based on continuous flow centrifugation and plate and frame filtration. Particle recovery efficiencies for inorganic particles (approximately 90%) were similar to other dewatering devices, but microbial cell recoveries (30-90%) were greatly improved by this technique relative to other currently available methods. Although requirements for operation and maintenance of the device are minimal, its size, as with other dewatering devices, limits its applicability at remote sites. Nevertheless, it has proven useful for sample collection in studies involving microbial transport and analysis of particle-associated trace inorganic solutes. (Author's abstract)

STUDIES ON THE ABILITY OF WATER HYACINTH (EICHHORNIA CRASSIPES) TO BIOCONCENTRATE AND BIOMONITOR AQUATIC MERCURY.

Berhampur Univ. (India). Dept. of Botany.
M. Lenka, K. K. Panda, and B. B. Panda.
Environmental Pollution ENPOEK, Vol. 66, No. 1, p 89-99, 1990. 4 fig, 3 tab, 15 ref.

Descriptors: *Aquatic plants, *Bioindicators, *Biological magnification, *Mercury, *Monitoring, *Water hyacinth, Bioaccumulation, Genotoxicity, Plant growth, Spectrophotometers, Water pollution control.

Water hyacinth (Eichhornia crassipes,) plants were employed to assess bioconcentration and genotoxicity of aquatic mercury. Plants were exposed to water contaminated with mercuric chloride (MC) or phenyl mercuric acetate (PMA) at 0.001 to 1.0 mg/L or mercury contaminated effluent from a chloralkali plant for various periods of 4 to 96 hours. Root samples taken after 4, 8, 12, 24, 48, 72, and 96 hours of exposure were analyzed for bioconcentration of mercury spectrophotometrically, and the root meristems were fixed in aceto-ethanol for cytological analysis to determine the frequencies of cells with micronuclei (MNC). Ethyl methane sulfonate and tap water served as positive and negative controls, respectively. The results indicated that bioconcentration of mercury in root tissue was both time-dependent and concentration-dependent, providing evidence that water hyacinth is a good absorbent of aquatic mercury. The frequency of root meristematic cells with MNC followed a concentration-response. The findings indicate the potential of water hyacinth plants for in situ monitoring and for mitigation of aquatic mercury pollution. (Author's abstract)

HEAVY METAL CONCENTRATION IN TELESCOPIUM FROM DARWIN HARBOUR, N.T., AUSTRALIA.

Northern Territory Univ., Darwin (Australia). School of Chemistry.
N. Peerzada, C. Eastbrook, and M. Guinea.
Marine Pollution Bulletin MPNBAZ, Vol. 21, No. 6, p 307-308, June 1990. 1 fig, 1 tab, 9 ref.

Descriptors: *Bioaccumulation, *Bioindicators, *Darwin Harbour, *Gastropods, *Pollutant identification, *Telescopium, *Water pollution sources, Atomic absorption spectrometry, Australia, Cadmium, Copper, Elizabeth River, Frances Bay, Path of pollutants, Race Course Creek, Rapid Creek, Trace metals, Wastewater pollution, Zinc.

Some gastropods have the clear potential to act as indicators of trace metals. Telescopium which is widely eaten by the aborigines is a sedentary filter feeder and likely to show the accumulation of heavy metal in Darwin Harbour. Samples of telescopium were collected from 11 sites around Darwin Harbour; at least, 15-20 specimens were collected from each site. The samples were digested and analyzed by flame atomic absorption spectrophotometry with a Varian AA1475. No background correction was used. The level of lead found ranged from undetectable to 8.99 microgm/g. High levels of lead were found in samples from Rapid Creek and Frances Bay. The highest levels were at Rapid Creek which received some treated sewage and storm runoff. Frances Bay received some Macerated sewage. No lead was detected elsewhere. High concentrations of Cd, 20.6 microgm/g, Zn, 1199.47 microgm/g, and Cu 72.05 microgm/g, were found at Race Course Creek, which receives sewage. The highest Cd levels were at Elizabeth River near boat ramps, landfills and sewage outlets. The concentration of Zn in samples from Rapid Creek ranged from 19.70 to 53.69 microgm/g. Oysters from the same area had Zn concentrations of 661.0 microgm/g indicating that telescopium is not a good accumulator of zinc compared to oysters. The concentration of Cu in the telescopium, 72.05 microgm/g, was double the concentration found in the oysters found in these creeks, 30 to 39 microgm/g. The concentration of Pb, Zn, Cu, Mn, Co, and Ni were generally below the recommended limit with the exception of Pb. (King-PTT)

NONPRIORITY ANALYSIS OF THE WASTEWATER STREAMS OF FOUR DYE MANUFACTURING FACILITIES.

Rutgers - The State Univ., New Brunswick, NJ. Dept. of Food Science.
L. H. Alaimo, T. G. Hartman, R. T. Rosen, L. J. McGgeorge, and R. W. Meyer.
Research Journal of the Water Pollution Control Federation JWPFA5, Vol. 62, No. 5, p 665-669, July/August 1990. 2 tab, 33 ref.

Descriptors: *Analytical methods, *Dye industry wastes, *Industrial wastes, *Pollutant identification, *Priority pollutants, *Wastewater analysis, Chloroaniline, Chlorotoluene, Dichloroaniline, Dioctyl phthalate, Gas chromatography, Mass spectrometry, High performance liquid chromatography, Mass spectrometry, Methylbenzenesulfonamide, Organic compounds, Toxicity, Trinitrophenol, Triphenyl.

The wastestreams of four dye manufacturing facilities were analyzed for the presence of dyes, dye precursors and intermediates using a battery of mass spectrometric techniques. Wastewater samples were extracted and concentrated using liquid/liquid extraction and XAD-2 resin adsorption methodology. Priority pollution analysis was conducted using EPA Method 625. Extracts were also analyzed using direct on-column injection capillary gas chromatography/mass spectrometry and desorption ionization techniques including thermospray high performance liquid chromatography/mass spectrometry and fast atom bombardment mass spectrometry. Elemental formulas for unknown compounds present at levels above 100 ppb were derived from accurate mass measurements using high-resolution mass spectrometry. The combined analytical data identified 313 compounds in the various wastewater streams. Partial structural characterization was obtained for an additional 94 compounds. A total of 107 unknown compounds were also detected. Only nine priority pollutants were detected using standard EPA methodology. The identified compounds were searched for genotoxic potential using the Gene-Tox database and 32 of them were identified as having genotoxic properties. The most concentrated of these were: chlorotoluene, 149 ug/l; dioctyl phthalate, 104 ug/l; triphenyl, 99 ug/l; dichloroaniline, 77 ug/l; chloroaniline, 59 ug/l; methylbenzenesulfonamide, 51 ug/l; and trinitrophenol, 46 ug/l. Environmental Science and Technology ESTHAG, Vol. 24, No. 6, p 863-867, June 1990. 4 fig, 2 tab, 18 ref.

Descriptors: *Chlorinated hydrocarbons, *Chlorination, *Chlorine, *Drinking water, *Mutagens, *Pollutant identification, *Public health, *Water pollution effects, Adsorption, Bacterial physiology, Humic substances, Laboratory methods, Residual chlorine.

The potent bacterial mutagen 3 chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone (MX) has been found to significantly contribute to the mutagenic activity in chlorinated drinking water. Reliable assessment of the possible effects of MX on human health requires an accurate measurement of the MX levels present in drinking water samples. This study indicates that optimal recovery from aqueous solution is obtained by adsorption of MX at acidic pH on XAD-8 Amberlite resin. In addition, in the presence of chlorine, the concentration of MX decreases at a rate that increases with increasing chlorine concentration. The data suggest that the MX level present in tap water is dependent not only on the amount of MX produced by the chlorination of humic substances, but also on the rate of

MX degradation by residual chlorine. (D'Agostino-PTT)

MULTI-ELEMENT ANALYSIS OF NATURAL WATER USING INDUCTIVELY COUPLED PLASMA-SOURCE MASS SPECTROMETRY (ICP-MS).
Surrey Univ., Guildford (England). Dept. of Chemistry.
N. I. Ward.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 197-204, 3 fig, 1 tab, 23 ref.

Descriptors: *Mass spectrometry, *Pollutant identification, *Trace elements, Aluminum, Atomic absorption spectrophotometry, Drinking water, Groundwater, Surface water, United Kingdom.

Inductively coupled plasma-source mass spectrometry (ICP-MS) offers exceptional ultra-trace multi-element sensitivity which is vital for measuring the concentrations which normally exist at microgram/milliliter or microgram/L in natural waters. ICP-MS provides simple spectra of isotopic elemental data covering a linear dynamic range of six orders of magnitude, with typical detection limits (3 sigma) for the majority of elements lying between 0.01 and 0.1 microgram/L. ICP-MS also offers the ability to measure isotope ratios enabling isotope dilution studies or the use of stable isotope tracers. Comparison is made with other established analytical methods (neutron activation analysis, atomic absorption spectrometry, ICP-OES, SS-MS, etc.) for the throughput/cost per determination analysis of natural waters. The preliminary assessment of the elemental composition of various British water samples collected from reservoirs (before filtration), after separation (filtration/treatment), and from consumer's tap-flow sites covering various rural and urban locations of thirteen water authority catchment areas revealed a wide variation in elemental content, especially Al as assessed by ICP-MS. NECESSITY OF BIOASSAYS IN WATER QUALITY MONITORING.
Institut fuer Wasserforschung G.m.b.H. Dortmund, Schwerte (Germany, F.R.).
C. Schmidt.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 245-254, 9 fig, 5 tab, 12 ref.

Descriptors: *Bioassay, *Monitoring, *Pollutant identification, *Toxicity, *Water pollution effects, Algae, Bioindicators, Fluorescence, Rhine River, Water quality.

A water quality management program requires continuous supervision of surface water and groundwater. The complexity of natural systems makes it difficult to determine the toxic potential of a substance in situ. Short-term changes of water quality cannot be detected by discontinuous sampling. Many chemicals cause biological reactions at very low concentrations and toxic substances almost always appear in a mixture. The biological effects of such a mixture cannot be determined by chemical analysis since water quality parameters like hardness, oxygen or pH influence the toxic effects. Consequently, it is the knowledge of toxic substances, water quality data, organisms and their reactions, which allows an estimate of toxicological potential. Depending on the specific problems, additional to the tests on the degradability of substances or tests on long-term effects, alarm-tests with a very short reaction time are required for water quality monitoring. These bioassays should use organisms from different trophic levels (i.e., bacteria, algae, zooplankton, higher plants and fishes). Bioassays for water quality monitoring purposes should be sensitive to a wide spectrum of substances and insensitive to matrix effects. They must show a respone within minutes, have a high degree of automation and no time-consuming servicing; they must additionally have low construction and working costs. An algae fluorescence bioassay was used to measure nitrite, nitrate, phosphate, and ammonia in the River Ruhr. An automated version of this algae fluorescence test is being used to monitor surface water quality along the Rhine River. (See also W91-01211) (Author's abstract)

PHOTOGRAPHIC SCREENING PROCEDURE FOR TRIAZINE HERBICIDES IN WATER USING AN ENHANCED LUMINESCENT IMMUNOASSAY.
Surrey Univ., Guildford (England). Dept. of Biochemistry.
A. Hardcastle, W. Aherne, and G. Thorpe.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 293-296, 1 fig, 2 tab, 3 ref.

Descriptors: *Herbicides, *Immunoassay, *Photography, *Triazines, *Water analysis, Atrazine, Laboratory methods, Pollutant identification, Quantitative analysis, Simazine.

The detection and quantitation of triazine herbicides in large numbers of water samples at the maximum allowable concentration of 100 nanograms/L poses a problem to the water analyst. The feasibility of using an enhanced luminescent immunoassay, with a photographic endpoint, for screening samples was assessed. Antisera to atrazine and simazine were raised in sheep and purified for the best immunological activity. Flexible round-bottomed microtiter plates were coated for at least 12 hr at 4 C with 200 microliters of purified antiserum diluted in barbitone buffer. Plates can be stored for several weeks before use. The concentration of coating antiserum and Horseradish Peroxidase (HRPO) label were optimized for the required assay incubation time. A Dynatec Microlite camera luminometer was used to record the light intensity produced in each well onto high-speed film (Polaroid 612). Visual estimates of atrazine concentration compared well with quantitative assay results. Large numbers of samples can be analyzed quickly using simple equipment. It is suggested that with further evaluation and validation, the procedure may represent an ideal method for screening samples for the presence of triazine. (See also W91-01211) (Geiger-PTT)

SHORE-BASED MICROBIOLOGICAL SAMPLING OF RECREATIONAL/BATHING WATERS: POSSIBLE PROBLEMS AND SOLUTIONS.
Clyde River Purification Board, East Kilbride (Scotland).
D. P. Milne.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 331-336, 3 fig, 2 tab, 10 ref.

Descriptors: *Bioindicators, *Coliforms, *Mathematical models, *Sampling, *Swimming, *Water analysis, *Water quality, *Water quality standards, Advection, Estuaries, Model studies, Tidal effects, Water quality control, Wind velocity.

Tidal state, wind velocity, and density structure can influence the near-shore levels of bacterial indicators by altering the distribution of discharged effluent. Field data from the Firth of Clyde, Scotland illustrate that the careful choosing of the sampling time can make a difference of up to two orders of magnitude in the fecal coliform level and, therefore, dictate whether recreational waters comply or not with the European Community Bathing Waters Directive. The Clyde River Purification Board and the University of Strathclyde's Department of Applied Physics have formed a research group to develop a mathematical microbiological model which may be applied to coastal waters. The model is based on the continuity equation which relates the advective and diffusive fluxes to fecal coliform input and inactivation. The model should prove to be an invaluable management tool in predicting whether an area is likely to comply, over a bathing season, and in planning the necessary developments required to make non-complying waters meet the Directive's standards. BETA-GLUCURONIDASE AS A RAPID COLORIMETRIC ASSAY FOR E. COLI IN WATER AND SEWAGE SAMPLES.
Surrey Univ., Guildford (England). Dept. of Microbiology.
M. R. Adams, and S. M. Grubb.
IN: Watershed 89: The Future for Water Quality in Europe. Volume II. Proceedings of the IAWPRC Conference held in Guildford, UK, 17-20 April, 1989. Pergamon Press, New York. 1989. p 391-395, 4 fig, 3 ref.

Descriptors: *Analytical techniques, *Bacterial analysis, *Colorimetry, *Enzymes, *Escherichia coli, *Pollutant identification, *Water analysis, Bioassay, Coliforms, Fluorometry, Quantitative analysis, Shigella.

Production of the enzyme beta-glucuronidase by bacteria is largely confined to Escherichia coli and, to a lesser extent, its close relatives in the genus Shigella. Approximately 95% of E. coli strains demonstrate this activity and its has been employed as a diagnostic feature in the identification and enumeration of the organism. In these tests, enzyme activity is invariably scored as present or absent based upon the production of color or fluorescence from an appropriate synthetic substrate. An alternative approach uses a quantitative assessment of color development as a means of directly enumerating the organism. Lake water and raw sewage were used to compare the present test with two reference methods in a competitive situation involving an unknown mixture of environmental organisms including E. coli. The lake water sample was concentrated to achieve detection in one day (detection time 6.55 hr). Both neat and diluted sewage were used. The undiluted sewage sample appeared to produce an inherent background color that interfered with the assessment of the detection time. The diluted sample was found more suitable for use with this method (detection time 6.4 hr). This method of quantitative assessment of the activity of the enzyme beta-glucuronidase as a means of directly enumerating E. coli showed promise as a rapid technique suitable for automation. LIBRARY U. OF I. URBANA-CHAMPAIGN

20 April, 1989. Pergamon Press, New York. 1989. p 397-404, 13 ref.

Descriptors: *Analytical techniques, *Bioindicators, *Pollutant identification, *Rotaviruses, *Shellfish, *Viruses, Antibiotics, Bacteria, Enzymes, Heavy metals, Humic acids, Immunoassay, Separation techniques, Toxicity.

An immunoperoxidase procedure has enabled rotavirus to be assayed in under 24 hr in samples of shellfish. Primary antibody tagging uses hyperimmune bovine anti-rotavirus serum while secondary antibody tagging uses rabbit anti-bovine serum conjugated with horseradish peroxidase. An elution-precipitation procedure or an alternative extraction procedure was used to concentrate the sample. Toxic components which interfere with virus uptake and cell metabolism such as heavy metals, humic acids and unspecified high molecular weight compounds must be removed by sewage flocculants, diphenylthiocarbazone (chelating agent), or Sephadex beads. In addition, dilution of the final extracts reduces toxicity to animal cells, and reduction in time of exposure reduces cytotoxic effects while allowing viral adsorption to take place. To assay viruses in animal cells grown in a nutrient-rich environment, bacteria must be removed by antibiotics, solvent extraction, or filter sterilization. Using the present methods, rotaviruses may prove to be a successful indicator organism for the presence of less culturable viruses in polluted waters. (See also W91-01211) (Geiger-PTT)

Quantitative assessments of sediment quality frequently are based on data derived from sediments collected by grab sampling. Often only one sediment or one composited sediment is collected at a sample site, thereby preventing any determination of spatial variance. The significance of spatial variance and collection method on cladoceran toxicity and indigenous microbial activities was determined at a creosote contaminated site in the Little Scioto River in Marion County, Ohio. Replicate sediments were collected on two occasions from a horizontal sample grid (110 sq m and 1.4 sq m) using an Ekman Dredge and hand core. Sediment particle size fractions did not vary significantly between replicate grab samples. Survival of Daphnia magna and Ceriodaphnia dubia in 48 hour solid phase exposures varied, however, from 1 to 100% horizontally and vertically at the test site. Percent survival and beta-glucosidase activity decreased in sediment sections below a 4 to 5 cm depth. Dredged sediments produced less toxicity to the daphnids than did core collected samples. The coefficient of variance was high (> 40%) for both survival and hydrolase activities (alkaline phosphatase, beta-galactosidase and beta-glucosidase) between horizontal sediment replicates collected by either dredge or core. Subsample variance, however, was small (< 20%). These results highlight the important role that sediment heterogeneity and collection method have on sediment quality assessments. (Author's abstract)

The lack of confirmation of identified analytes in environmental gas chromatography (GC) that uses the traditional one-column, one detector systems (e.g., GC-electron capture detection with a nonpolar column) often raises questions as to the validity of the data. To avoid misidentification of chlorinated pesticides and polychlorinated biphenyls (PCB), simultaneous dual-column, dual-detector GC analysis was conducted. Within one GC instrument, injected sample extracts were split in two and each portion passed through a capillary column of different polarity. A traditional nonpolar column, DB-5, was connected to an electron capture detector for initial identification of analytes; a more polar column DB-17, was used with the halogen specific electrolytic conductivity detector for confirmation analysis. GC column retention characteristics were determined for a large set of environmentally important pesticides and PCB congeners for the DB-5 and DB-17 analytical columns. The dual-column, dual-detector system was then evaluated on a large number of environmental samples of different matrix types. Results indicated that a substantial number of analytes, especially pesticides, may be incorrectly identified in environmental samples with one-column, one-detector systems. Use of a simultaneous dual-column, dual-detector system, substantially decreases the risk of false positive identifications without significantly increasing the cost at time of analysis. Descriptors: *Aquatic bacteria, *Bacterial analysis, *Bacterial growth, *Biomass, *Limnology, *Water analysis, Calibrations, Estimating, Growth rates, Nucleic acids, Testing procedures.

A review of the methods designed to measure growth rates of natural bacterial assemblages is presented. In addition, problems in sizing bacteria and determining bacterial carbon biomass are considered. A large number of techniques are now available to determine growth rates of natural bacterial assemblages. 3H-thymidine incorporation and 3H-adenine incorporation into DNA and 3H-leucine incorporation into protein are currently in use in many laboratories. When properly calibrated these methods can give reasonable estimates of bacterial growth rates. The leucine and thymidine methods together will give the best assessment of bacterial growth rates and information on their physiological status. Adenine incorporation requires size fractionation of environmental samples if used to measure only bacterial growth. When adenine is used together with thymidine, an index of both algal and bacterial DNA synthesis can be obtained. The use of the frequency of dividing cells (FDC) procedure often overestimates bacterial carbon production compared to results obtained from other techniques. It was found that many of the methods are complementary when compared over proper time scales, but continued calibrations and validations of the methods are still needed when environmental samples are examined for growth of bacteria. kinetics, *Toxicology, *Water pollution effects, Mathematical models, Mathematical studies.

While clinical and toxicological applications of pharmacokinetics have continued to evolve both conceptually and experimentally, pharmacokinetic modeling in aquatic animals has not progressed accordingly. Several methods and concepts are presented this literature review of pharmacokinetic modeling in aquatic animals using multicompartmental, clearance-based, non-compartmental and physiologically-based pharmacokinetic models. These models should be considered as alternatives to traditional approaches, which assume that the animal acts as a single homogeneous compartment based on apparent monoexponential elimination. Multicompartmental models are a necessary increase in complexity when elimination is biphasic, or when there is a widely different distribution between high perfusion and low perfusion tissues. Alternatives to traditional rate constant based models are clearance-based compartmental models, which have parameters that may be interpreted in terms of the controlling physiological and biochemical processes. Non-compartmental methods characterize uptake, distribution, elimination, and persistence without making assumptions about the underlying model topology. The development of physiologically based models is highly desirable because they allow extrapolation to other species, body sizes and environmental conditions. (Author's abstract)

Descriptors: *Adenosine triphosphate, *Aquatic bacteria, *Bacterial physiology, *Microbiological studies, *Separation techniques, *Toxicity, *Water pollution effects, *Water quality monitoring, Algae, Analytical methods, Bacterial analysis, Bioassay, Biomass, Inhibitors, Mathematical models.

The measurement of adenosine triphosphate (ATP) was utilized as a speedy, sensitive, precise and accurate indicator of bacterial biomass changes. Some substances (sodium and potassium hydroxides, potassium cyanide, hydrogen peroxide and sodium azide) were found to decrease bacterial ATP pools within a few seconds. The effects were not observed for Chlorococcus sp., Selenastrum sp. and Scenedesmus sp. If this behavior is confirmed in all algae, then it will be possible to define the bacterial/algal ATP ratio. The bacterial growth rate could then be evaluated using ATP as a biomass index in a simple mathematical model. It is probable that the physiological response to toxic substances depends not so much on the trophic level of microorganisms as on multiple factors such as the biochemical and physiological structure of the microbial community and the complexity of cell/detritus aggregates. Further study of the effects of toxic substances on a wider spectrum of microorganisms, especially Cyanobacteria, is recommended. (MacKeen-PTT)

Methods for measuring 228Ra were reviewed to select a brief and simple screening procedure under the National Interim Primary Drinking Water Regulations for public water supplies. A two-step method was considered to concentrate Ra by evaporation or co-precipitation and to count it with a gas ionization detector, a liquid-scintillation detector, or a Ge detector with multichannel analyzer. Gross beta particle counting appears to be feasible for screening to meet the 0.04 Bq/L detection limit. The same sample volume can be utilized to measure radiation with commonly available equipment in reasonable time. The required sample volumes were estimated on the basis of known counting efficiencies and background count rates. Gamma-ray spectral analysis is the recommended option, however, because 226Ra and 228Ra can be determined directly and simultaneously. Several aspects of the method were examined to assure that the concentration procedure is nearly quantitative and that the detection limit can be reached with a 3.8 L sample in a 6000 s counting period. The method was tested with Ra tracer solutions and EPA intercomparison samples over the range of 0.04 to 1 Bq/L. It was found appropriate for 228Ra and 226Ra analyses. (Author's abstract)

The application of Salmonella/microsomal mammalian tests to column chromatography fractions isolated from river and marine sediments collected in the vicinity of Barcelona city, Spain, demonstrated a positive response (TA98+S9 mix) among the polar fractions. Chemical analysis by high resolution gas chromatography coupled to negative ion chemical ionization mass spectrometry (HRGC-NICI MS) provided sensitivity and selectivity to detect several mutagenic chemical classes. Among them, nitrated PAHs, azaarenes, aromatic amines, anhydrides, and ketones were identified. A total of 116 compounds were tentatively identified, 22 for the first time, of which 16 possessed mutagenic activity. However, a lack of correlation between chemical composition and fraction mutagenicity in the medium polarity fractions, especially in the river sediment, was evidenced. The occurrence of multiple interactions between components in spiked organic extracts is demonstrated. (Author's abstract)

Data on aliphatic and aromatic hydrocarbons in different species of edible bivalves collected from the Todos os Santos Bay (Bahia, Brazil) are reported on for the first time along the Southwest Atlantic coast. The species and collection sites were selected for the identification of suitable regional sentinels and for the assessment of different coastal pollutant sources. To this end, the molecular marker concept was applied. A new series of biogenic 20C, 25C, and 30C highly branched isoprenoid alkenes were present in clean samples. Long-chain alkylbenzenes and specific distributions of isoprenoids, steranes, and hopanes reflected local industrial activities. Petrogenic alkanes and aromatic hydrocarbons, ranged between 0.1-42 micrograms/L wet wt and 0.1-9.1 micrograms eq chrysene/g wet wt, respectively, the higher levels being found in the neighborhood of an oil refinery and a plant oil industrial plant. Anomalocardia brasiliana, the dominant and most frequent bivalve of the Brazilian coast, was found to be an adequate bioindicator because it accumulates organic pollutants with reasonable sensitivity. GC-MS IDENTIFICATION OF GASEOUS VOLATILES IN WASTEWATER.
National Univ. of Singapore. Dept. of Civil Engineering.
L. C. C. Koe, and N. C. Tan.
Environmental Monitoring and Assessment EMASDH, Vol. 15, No. 1, p 13-24, July 1990. 4 fig, 5 tab, 8 ref.

Descriptors: *Chemical analysis, *Gas chromatography, *Mass spectrometry, *Pollutant identification, *Volatile organic compounds, *Wastewater, *Water analysis, Aeration, Air stripping, Chlorinated hydrocarbons, Hydrocarbons, Organic acids, Phenols, Sulfides.

Gaseous volatiles from wastewater samples taken from a local sewage treatment plant were air stripped and trapped onto Tenax GC. These volatiles were then thermally desorbed and subsequently analyzed using gas chromatograph coupled to a mass spectrometer (GC-MS). The results show that saturated aliphatic and aromatic hydrocarbons were the most dominant compounds found in the sewage gaseous volatiles. Other compounds found were chlorinated hydrocarbons, organic acids, sulfides and phenols. A wide variety of gaseous volatiles were found in the raw wastewater, the primary clarifier effluent, the pre-aeration wastewater and the sludge samples. A comparison of the gas chromatograms for the pre and post-aeration wastewater shows that many odorous gaseous volatiles were removed during the aeration process in the treatment plant. Descriptors: *Bioindicators, *Cadagua River, *Caddisflies, *Ecosystems, *Spain, *Species diversity, *Water pollution effects, *Water quality, Headwaters, Oxygen, Species composition.

Water quality effects were studied in of the River Cadagua basin in Spain, using trichopteran taxa as indicators. Differences between headwater reaches and lower parts of the main river and its principal tributaries are chiefly based on the downstream substitution of the species of the genus Rhyacophila by species of the genus Hydropsyche. The first station of the Cadagua River is separated from other headwater sites by the presence of a trichopteran assemblage composed of Rhyacophila tristis, Lype reducta and Tinodes assimilis. Sympatric species of the genera Rhyacophila and Hydropsyche coexist at several places, although appear alone at other sites, and show differential preferences for the highest or the lowest sites. Thus, Hydropsyche pellucidula coexisted with Hydropsyche siltalai in the middle section of the rivers, but the former was distributed further downstream than the latter which occupied higher reaches. Among sites, differences in trichopteran assemblage structure are a result of both natural and anthropogenic changes in the physicochemical features of the watercourse. Therefore, trichopteran diversity and coexistence of sympatric species increase downstream with increasing nutrient values (whether the oxygen content of the water is near the saturation level). However, Trichoptera disappear from sites with low oxygen content. Conductivity values do not seem to affect the trichopteran distribution in natural waters, as values higher than 700 microS/cm were found at the head water of the main river which contained an assemblage characteristic of these sites. A flow-injection system for rapid automated enzyme inhibition testing was developed using magnetic particles as the enzyme support. Exchange of inactivated enzyme immobilized on magnetic particles was performed with magnetic devices which could be electrically switched off to release all bound material. The flow resistance of the reactor was excellent. Inhibition of immobilized acetylcholinesterase (ACHE) was used to determine pesticides in drinking water. Concentrations of 0.5 microgram/L of the pesticides carbofuran and malaoxon were detected. A complete cycle of analysis, including calibration, took 20 min. The sensitivity of this assay is excellent and covers the demands for European drinking water analysis, although the detection limit has not yet been optimized. However, as the contamination of drinking water is expressed as the amount of pesticide and not as the toxicity against ACHE, the proposed method is a good alternative to non-biological standard methods such as gas chromatography and liquid chromatography. Analytica Chimica Acta ACACAM, Vol. 234, No. 1, p 119-126, July 1990. 6 fig, 1 tab, 23 ref.

Descriptors: *Analytical methods, *Chemical analysis, *Liquid chromatography, *Mass spectrometry, *Organic pollutants, *Pesticides, *Pollutant identification, *Spectrometry, *Water analysis, Organophosphorus compounds, Surface water.

An on-line extraction system with completely continuous-flow analysis prior to the liquid chromatographic (LC) column was used for the determination of the organophosphorus pesticides tetrachlorvinphos and parathion-methyl and their degradation products 2,4,5-trichlorophenol and 4-nitrophenol, respectively, and the chlorinated phenoxy acids 2,4-D, 2,4,5-T and silvex in water samples. The extent of extraction varied from 100% for chlorinated phenoxy acids to 60% for organophosphorus pesticides and 2,4,5-trichlorophenol. The extraction of 4-nitrophenol was less than 10% under these conditions. By employing positive-ion mode thermospray LC-mass spectrometry, the characterization of tetrachlorvinphos was feasible, indicating (M + NH4)(+) as the base peak and a second peak with 20% relative intensity corresponding to (M + H)(+). When the negative-ion mode was used, the chlorinated phenoxy acids and 2,4,5-trichlorophenol exhibited (M + HCOO)(-) as the base peak and a second peak with 30% relative intensity corresponding to (M-H)(-). Enrichment factors of almost one order of magnitude have been achieved for model compounds in water samples. These enrichment factors using liquid-liquid extraction are lower than those obtained with on-line precolumn systems using solid adsorbents, but there are less memory effects. This system allows the ultraviolet detection and mass spectometer characterization of low-nanogram levels of pesticide residues in river water samples. (Author's abstract)
